136,120.—*Plow.*—GILMAN D. WYMAN, Oshkosh, Wis.

The mold-board is made adjustable as regards the rear end of the beam by means of a swivel screw-bolt, one end thereof being secured to the mold-board and the other to the rear end of the plow-beam; and by the adjustment thus provided the plow can be caused to take more or less "land."

Claim.—The combination of the beam A and mold-board handle H, the screw-rod K, and the screw-swivel D D, as described.

136,121.—*Rod and Fluting Iron.*—DANIEL W. YOUNG, JOHN HEWITT, and LAWRENCE MOONEY, Pittsburg, Pa.; said YOUNG and MOONEY assignors to said HEWITT.

Fluted rolls occupy recesses which cross one face of the iron. The opposite face of the iron is finished to be used as an ordinary rod-iron. On its end is connected by a pivot a latch with forked ends, fitted to the end of the iron with a spring upon its upper end, to hold in position and to allow the face of the iron to be changed or turned.

Claim.—1. The rollers B B, when secured in a rod-iron or block so as to operate substantially as described.

2. The revolving plate A, having one face finished as a rod or polishing iron and the reversed side recessed to receive rollers B B, in combination with said rollers and a spring-latch, D, or an equivalent fastening, the whole being so constructed and arranged as to operate substantially as described.

136,122.—*Lead-Pencil.*—PHILIP HUPELAND, New York, N. Y.

Claim.—A lead-pencil having attached to one of its ends a tube of paper, leather, cloth, or other tough and flexible material, form-

ing a continuation of the pencil, and containing a piece of India rubber, which it incloses entirely, or nearly so, so that it must be cut away to expose the rubber for use, substantially in the manner herein shown and described.

REISSUE PATENTS.

5,283.—*Gasifying Fuel for Heating, &c.*—WILLIAM ELMER, New York, N. Y.—Patent No. 87,156, dated February 23, 1869; antedated February 13, 1869.

Claim.—1. The process or method herein described of gasifying crude fuel by subjecting it, out of contact with the atmosphere, to the process of distillation described, and by subjecting the distillate, in a second retort or series of retorts, to a temperature sufficiently high, not less than 2000° Fahrenheit, as specified, to convert the distilled products into permanent inflammable gases, substantially as above set forth.

2. A clay gas-retort divided into two chambers by a partition inserted directly in the retort without any intervening flues or pipes, constructed and arranged as and for the purpose herein specifically described.

5,284.—*Manufacture of Inflammable Gases for Fuel, &c.*—WILLIAM ELMER, New York, N. Y.—Patent No. 106,569, dated August 23, 1870; antedated August 12, 1870.

Claim.—The process herein described of manufacturing gas-fuel from bituminous coal or equivalent crude fuel, by subjecting its distillates to the action of high heat, not less than 2000° Fahrenheit in the manner and by the means herein specified, whereby such distillates are decomposed into hydrogen and carbonic oxide.

5,285.—*Machine for Drilling Rock.*—STILLMAN W. ROBINSON, Champaign, Ill., and DE VOLSON WOOD, Ann Arbor, Mich.—Patent No. 71,320, dated November 26, 1867.

Claim.—1. In a rock-drill, the construction and arrangement of a cylinder for driving a drill, one end of said cylinder serving as a tool-holder, and having suitable attachments for rotating the tool, or feeding it forward, or both combined, as herein described.

2. The click L L, rotating on an axis parallel to or somewhat inclined to the axis of the drill-bar, in combination with the ratchet M, as and for the purposes described.

3. In machines for working on stone in which the tool is reciprocated by an elastic motor in a cylinder, the combination of the cylinder, ways, and gripes O and Q, or other suitable devices for holding the machine to the ways, constructed and arranged essentially as set forth, that when the device O is freed from its hold at or near the end of the forward stroke by means of a projection on the drill-bar, the machine may be fed forward on the ways by the reaction of the motor in the cylinder during the back stroke of the drill-bar, and held in its advanced position by means of the device Q, substantially as described, and for the purposes set forth.

4. The combination of the gripe O, lever N, ways Y, and tappet *p*, as and for the purposes described.

5. The combination of the carriage Z, gripe Q, spring *d*, and ways Y, as and for the purposes described.

6. The tool-holder, as described, consisting of the hollow cone P and wedges G G, constructed and arranged as described.

5,286.—*Spring Bed-Bottom.*—HENRY DWIGHT WEIGHT BAILEY, Sterling, Ill.—Patent No. 107,213, dated September 13, 1870.

Claim.—1. A bed bottom composed of slats supported by springs and flexibly connected to each other, so that one or more may be reversed or removed from the springs and connection without unfastening or removing the remainder, substantially as described, for the purpose specified.

2. The combination of the rails B, slats E, elastic loops or springs C, loops D, and flexible strap F, substantially as described, for the purposes specified.

5,287.—*Ice-Machine.*—FERDINAND PHILLIPPE EDOUARD CARRÉ, St. Pierre Les Nemours, assignor of part interest to JEAN B. J. MIGNON and HENRI S. ROUART, Paris, France.—Patent No. 30,201, dated October 2, 1860.—Division A.

Slats are hung from the end rails of the bedstead by elastic loops, and by flexible straps in the center, so that slats may be turned or detached at pleasure.

Claim.—1. An apparatus for the practical production of ice and cold, consisting of two chambers, one for separating the gas from the absorbent containing it, and the other for condensing it, connected by a tube, E, or its equivalent, substantially as described.

2. In an apparatus for the practical production of ice and cold, chamber A, having internal disks B and flanges C, substantially as described.

5,288.—*Manufacture of Ice.*—FERDINAND PHILIPPE EDOUARD CARRÉ, St. Pierre Les Nemours, assignor of part interest to JEAN B. J. MIGNON and HENRI S. ROUART, Paris, France.—Patent No. 30,201, dated October 2, 1860.—Division B.

Claim.—1. The process of practically producing ice and cold by driving off a volatile gas from a solution or absorbent containing it into a closed chamber, where it is condensed by means of its own pressure and elasticity, assisted by the extraction of its heat, again volatilizing it to obtain cold, and returning it to the absorbent which has been properly cooled, substantially as described.

2. In a process for the practical production of ice and cold, promoting the evaporation of a liquefied gas by means of an absorbent or substance having a chemical affinity for the gas evaporated, instead of an exhausting-pump.

5,289.—*Machine and Process for Making Paste.*—GEORGE G. NOAR, Boston, Mass.—Patent No. 73,115, dated January 7, 1868; antedated December 28, 1867.

Steam is caused to permeate the contents of the tub, cooking the same, at the same time that the contents of the tub are being thoroughly mixed together by the revolving arms firmly attached to a revolving shaft, some of which are perforated and some are not, and through the perforated one of which the steam is inducted into the contents of the tub.

Claim.—1. The process herein described for making paste by the introduction of steam into the paste-tub to permeate the contents thereof, for the purpose of cooking and boiling the same at the same time that said contents are being thoroughly mixed together.

2. The hollow perforated arms C C, attached to the hollow revolving shaft B for the purpose of admitting the steam into the contents of the paste-tub at the same time as said contents are being mixed together, substantially as herein set forth.

3. The combination of the hollow revolving shaft B, hollow perforated arms C C, and the unperforated arms D D, all arranged within the paste-tub A, substantially as and for the purposes herein set forth.

5,290.—*Divider.*—O. E. WEATHERHEAD, Ashland, Mass., assignor to ALBERT A. COOKE, GEORGE L. COOKE, and S. W. COOKE. Patent No. 73,433, dated December 17, 1867.

One leg of the instrument is beat or offsetted and grooved for the reception of a pencil or extension piece, which is secured in position by a band and clamping-screw.

Claim.—1. The leg of a pair of dividers when grooved or made concave, as and for the purpose set forth.

2. A clamping device, when used in combination with the grooved or concave leg of a pair of dividers, for the purpose set forth.

5,291.—*Casting Stench-Traps.*—JAMES E. WHITE, New York, N. Y., assignor to LOUIS A. CAUVET.—Patent No. 100,786, dated November 29, 1870.

An external groove is formed on the line of union of the two sections, the edges of said sections being thickened to strengthen the joint. The collar *e* is cast with the other portion, and a threaded core is employed to form the thread on the interior of the collar.

Claim.—1. The trap or bend made with the groove *f* on the line of union of the sections or halves of the trap between the projections along the edges, substantially as set forth.

2. The collar *e* of lead cast with the other portion of the trap or bend, substantially as set forth.

3. A mold for casting soft-metal traps containing a threaded core around which the lead collar is cast, substantially as set forth.

5,292.—*Insect-Destroying and Disinfecting Compound.*—ALEXANDER MCDOUGALL, Manchester, England, assignor, by mesne assignments, to JAMES S. MILLAR, Montreal, Canada.—Patent No. 66,725, dated July 16, 1867.

For sheep-wash and vermin-destroyer, dead-oil of coal-tar, two parts; caustic soda of 50° Twaddel, one part; fat or tallow, one part. For disinfecting fecal matter, add to dead-oil three per cent. nitric acid. Mix with water containing lime, magnesia, and other alkali or alkaline earths.

Claim.—1. The oil obtained (after the naphtha or spirit has been removed) in the distillation of tar resulting from the destructive distillation of carbonaceous substances, or of any of the constituents of this oil, in combination with an alkali or alkaline earth and with fatty or other saponifiable substances, substantially as herein described, as a dressing for sheep or other animals, and for other purposes.

2. The oil herein specified, or any of its constituents, after treatment with an acid, as described, in combination with an alkali or alkaline earth, as a material for the disinfection of fecal, sewage, or other matters, and the destruction of entozoic parasites contained therein, or for the destruction of entozoic parasites or vermin in soils.

INDEX OF INVENTIONS PATENTED FEBRUARY 18, 1873.

[The numbers in parentheses denote the classification of patents.]

Animals, sling for raising, (79,) F. Hohorst 136,059
Asphalt, treating, (110,) P. Barthel 135,879
Awning, (30,) J. Boyle 135,966
Bale tie, (7,) M. Quin 135,938
Barrels, boxes, &c., machine for lifting and carrying, (79,) J. W. Babcock 135,958
Bed bottom, (62,) Boesen and Bedessem 135,965
Bed bottom, (63,) B. Holmes 135,969
Bed bottom, (62,) Ogborn and Kendrick 135,933
Bed bottom, spring, (62,) H. D. W. Bailey, (reissue) 5,286
Bed bottom, spring, (62,) L. Bush 135,885
Bed or cradle guard, (62,) J. J. Roll 136,097
Bed and frame, spring, (62,) W. Z. Cooke 135,892
Boiler, steam, (146,) Davis and De Guinon 136,041
Boiler, sectional steam, (148,) Babcock and Wilcox 135,877
Boiler, sectional steam, (148,) J. Harris 135,910
Bolt cutter, (100,) L. J. Chapman 135,887
Boot and shoe fastening, (16,) G. H. Ward 136,111
Boot and shoe gores, elastic material for, (16,) C. Winslow 136,119
Boot and shoe soles, machine for trimming, &c., the edges of, (16,) J. W. Maloy 136,080
Boots and shoes, nail for attaching soles to, (16,) W. Wickersham 136,014
Bosom pad, (80,) C. A. Phillips 135,936
Bottle stopper, (1,) A. De Mestre 136,045
Bottle stopper, (1,) H. F. Reiner 136,095
Bread worker, (88,) J. Balderston 135,959
Bridge, iron, (21,) W. B. Cooper 135,970
Broom bag, (32,) E. D. Bronson 136,026
Burner, lamp, (90,) W. N. Weeden 136,113
Burner, vapor, (90,) Benson and Watkins 136,021
Burner, vapor, (90,) Benson and Watkins 136,022
Button hole cutter, (38,) A. Day 135,893
Can for paint, liquid, &c., (107,) H. Miller 136,065
Can for oils, &c., measuring, (133,) W. B. Sherman 136,103
Canal boats, propelling, (159,) A. Johnson 136,064
Car coupling, (152,) G. W. Coffin 136,033
Car coupling, (152,) W. T. Collins 135,890
Car coupling, (152,) G. D. Crosthwait 136,039
Car coupling, (152,) J. W. and J. W. Gillam, Jr 135,964
Car coupling, (152,) J. R. Succop 136,011
Car coupling, (152,) J. Temple 135,948
Car propulsion, (121,) R. De Laidi 135,972
Car starter, (122,) J. B. Jones 135,920
Car ventilator, (121,) J. J. Crowley 135,971
Car wheel, (122,) J. W. Kern 136,068
Car axle box, (198,) C. T. Fay 135,977
Car brake, railroad, (192,) F. G. Bates 136,019
Car springs, manufacture of, (192,) N. and A. Middleton, Jr 135,929
Cars, safety hatch for railroad, (121,) R. Liston 135,923
Carburetor, (37,) T. B. Fogarty 135,981
Carburetor, (37,) T. B. Fogarty 135,982
Carpet fastener, (62,) C. B. Browne 135,884
Carriage spring, (31,) J. R. Whitcomb 136,116
Carriage shaft eyes, tool for milling, (31,) W. S. Ward 136,112
Cartridge loading machine, (32,) A. C. Hobbs 135,913
Chair, barber's, (62,) P. Haberstich 135,966
Chair, barber's, (62,) A. Schwaab 136,009
Chair, oscillating, (62,) W. T. Doremus 135,974
Chair, seat, &c., (62,) W. T. Doremus 135,973
Chair, rocking, (62,) W. Mohr 136,066
Chair, folding rocking, (62,) A. Russell 136,099
Cheese, making, (45,) H. O. Freeman 136,051
Churn dasher, (45,) W. M. Combes 136,035
Clamp, (29,) C. S. Bonney 135,882
Clothes washer, (91,) H. D. Crooker 136,038
Coal mining machinery, (124,) J. Alexander 135,874
Comb, toilet, (181,) I. S. and J. W. Hyatt 135,918
Cultivator, (43,) J. Behel 135,964
Cultivator, (43,) D. Edwards 136,047
Cultivator, (43,) J. B. Hinckley 135,912
Cultivator, (43,) J. Mills 135,907
Cultivator, (43,) J. W. Swickard 136,108
Curtain fixture, (62,) C. Buckley 136,030
Curtain fixture, (62,) H. L. Traphagen 135,950
Cutter head for matching boards, (174,) G. Greenwood 135,907
Dentist's stool, (62,) L. W. Lyon 135,924
Digger, potato, (114,) A. G. Brush 136,028
Dividers, (97,) O. E. Weatherhead, (reissue) 5,290
Door spring, (24,) A. D. Hoffman 135,914
Drill, grain, (133,) S. R. Nye 135,932
Drills, mechanism for operating and feeding oil well, (124,) G. A. Hinckley 135,988
Drilling rock, machine for, (124,) Robinson and Wood, (reissue) 5,285
Eaves trough hanger, (30,) H. B. Todd 136,109
Engine, floating fire, (118,) J. C. Lang 135,922
Engines, condenser for steam, (150,) S. A. Goodwin 135,906
Engraving and carving machine, (54,) T. W. Minter 135,998
Fan, automatic, (165,) W. DeL. Hall 136,044
Fare box, (42,) J. F. Winchell 136,118
Fence, wire, (58,) J. W. Rappleye 136,094
Fender, clod, (43,) A. L. Dirst 135,896
Fertiliser, (96,) J. McDougall 135,995
Fertilisers, preparing blood for, (96,) W. D. Craven 136,036
Fire arm, magazine, (18,) Swingle and Huntington 135,947
Fire arm, breech loading, (55,) E. Maynard 135,998
Fire plug systems, cut off for, (167,) F. W. Eames 135,976
Fishing line, (143,) F. E. Forster 135,900
Fly catcher, (143,) L. Bartlett 135,961
Folding case, (62,) J. C. Barker 135,878
Fruit, canning, (58,) J. R. Matthews 135,927
Fruit fork, (44,) L. C. Draper 135,975
Fruit gatherer, (63,) J. Kleor 136,072
Furnace, reverberatory, (85,) G. Atkins 136,017
Furnace for melting brass and other metals, (99,) I. D. Bush 135,967
Furnaces, fettling for puddling and boiling, (35,) McAninch and Atkins 136,083
Furnaces, apparatus for condensing the smoke of metallurgic, (99,) W. J. Johnson 136,056
Game board, (143,) G. R. Elliott 136,048
Gas burner, (64,) T. B. Fogarty 135,978
Gas burner, (64,) T. B. Fogarty 135,979
Gas lighter, (66,) E. D. McCracken 136,004
Gas machine, (27,) T. B. Fogarty 135,980
Gas lighting torch, (64,) C. H. Roberts 136,006
Gas regulators, valve for, (64,) J. C. Sarsfield 136,007
Gas burners, stop cock and regulator for, (64,) A. E. Delouset 135,895
Gases, apparatus for the manufacture of, (35,) W. Maynard 136,081
Gases for fuel, &c., manufacture of inflammable, (66,) W. Elmer, (reissue) 5,284
Gasifying fuel for heating, &c., (66,) W. Elmer, (reissue) 5,283
Generator, steam, (148,) P. J. McMahon 135,996
Glove, (38,) E. V. Whitaker 136,115
Grain band, bag tie, &c., (74,) E. Foote 135,899
Halter rings, fastening for, (23,) E. R. Kinne 136,071
Harness mounting, (72,) J. F. Knorr 136,073
Harrow, (73,) W. Brown 136,027
Harvester, grain binding, (74,) C. F. Goddard 135,985
Hat rack, (76,) N. Clarke 136,032
Hat and coat guard, (24,) S. N. Robbins 136,005
Hay, apparatus for elevating and unloading, (79,) H. Buck 136,029
Heater, water, (154,) J. Kenfield, Jr 135,921
Heel nailing and shaving machine, (16,) L. P. Hawkins 135,911
Hides and skins, treating, (92,) W. Maynard 136,082
Hinge, blind, (24,) A. Huffer 136,061
Hinge, trunk, (24,) A. M. Darrell 136,040
Hoe, (141,) N. D. Beecroft 136,020
Hook, (104,) R. Weiss 136,114
Hook, hat and coat, (24,) C. G. Cole 135,888
Horse power, (159,) Z. P. Landrum 136,075
Horse hay fork, (77,) G. Atherton 136,016
Horseshoe nail machine, (60,) J. M. Laughlin 135,903
Ice machine, (58,) F. P. E. Carré, (reissue) 5,287
Ice, manufacture of, (88,) F. P. E. Carré, (reissue) 5,288
Ink pad, (146,) Towne and Taylor 135,949
Inkstand, (146,) Kidder and Hood 136,070
Ink well, (146,) J. H. Kidder 136,069
Insect destroying and disinfecting compound, (35,) A. McDougall, (reissue) 5,292
Iron, manufacture of, (85,) W. Bushnell 135,886
Jar, slop, (88,) W. S. Potwin 135,937
Knitting machine, (69,) Tailbouis and Renevey 136,012
Kite, (143,) C. J. Hardekopf 135,967
Lamp wick raiser, (90,) A. Combs 136,034
Lamp cooking apparatus, portable, (65,) Sliber and White 136,104
Leather, machine for pricking, (16,) G. C. Converse 135,969
Lemon squeezer, (88,) A. Bigelow 136,023
Lock, door, (93,) H. H. Elwell 136,049
Lock, permutation, (93,) T. B. Worrell 135,957
Log, stay, (176,) J. A. Squires 135,945
Mechanical power, (67,) E. W. Morton 136,088
Medical compound, (98,) J. Geeman 135,983
Metal coated ware, (113,) G. Booth 136,025
Millstones, staff gage for dressing, (57,) L. B. Woolever 135,956
Mortising machine, (173,) E. J. Houston 135,917
Nail cutting machine, (103,) Hollis and Chess 135,915
Nail selecting and delivering machine, (103,) A. Knowlton 136,074
Oil still, (47,) E. Schalk 136,098
Organ, reed, (106,) C. Austin 135,875
Padlock, combination, (93,) J. Kittle 135,992
Pail, dinner, (86,) R. S. Squires 135,946
Paste, machine and process for making, (98,) G. G. Noah, (reissue) 5,289
Pencil, lead, (146,) P. Hufeland 136,122
Piano forte lids, raising, (112,) H. N. Oliver 136,090
Pipe, &c., cutting, (100,) Pennock and Chandler 136,004
Pitcher top, molasses, (88,) G. P. Lang, Jr 136,076
Planing machine, (160,) T. Shaw 135,941
Planter, corn, (133,) J. Sheer 135,942
Plow, (114,) G. D. Wyman 136,120
Plow, gang, (114,) A. N. Humphrey 136,062
Plow, sulky, (114,) W. Ough 136,093
Pocket book, (146,) W. H. King 135,990
Printer's lead rack, (117,) O. A. Dearing 135,894
Propeller, vibrating, (139,) C. P. Macowitsky 135,994
Pump piston, (118,) C. B. Gill 135,905
Purifier, middlings, (57,) E. P. Welch 135,952
Purifier, middlings, (57,) E. P. Welch 135,953
Railroad bed, (190,) J. W. Kern 136,067
Railroad rail, (120,) Dean and Coleman 136,043
Railroad rails, punching bolt holes in steel, (120,) T. Critchlow 136,037
Railroads, endless rolling gear for, (192,) J. Frye 136,050
Railway dust preventer, (120,) J. Wellby 136,013
Railways, wheel for endless, (122,) J. Frye 136,053
Railways, platform carrier for endless, (122,) J. Frye 136,054
Ratchet pinion, (7,) J. F. Kingwill 135,991
Regulator, water, (167,) J. P. Bolin 136,024
Rice cleaning machine, (57,) J. N. White 136,117
Ripper and rag looper, (38,) H. M. Johnson 136,065
Riveting machine, (119,) W. Sellers 136,100
Sad and fluting iron, (38,) Young, Hewitt and Mooney 136,121
Sad iron, cage for heating, (154,) G. W. C. Lovell 136,077
Sash fastener, (24,) R. E. Beckwith 135,963
Saw gummer, (131,) H. Bangkman 135,962
Saw gummer, (131,) W. Tucker 136,110
Saw filing vise, (131,) C. S. Bonney 135,883
Saw teeth, machine for cutting, (131,) Onion and Lardusky 135,934
Scaffold, (30,) A. Gates 135,904
Scales, steelyard, (132,) T. C. Hargrave 135,908
Screw propeller, (139,) M. M. Wilson 136,015
Screw bolt and nut, (14,) T. English 135,898
Seeding machine, (74,) J. W. Strowbridge 136,107
Sewing machine, (134,) C. Gullman 136,057
Sewing machine, (134,) J. C. Moore 135,930
Sewing machines, tuck creaser for, (134,) A. Johnston 135,919
Sewing machines, embroidering attachment for, (134,) I. M. Rose 136,096
Sewing machine needles, cushion and sharpener for, (70,) J. D. Nesbitt 135,931
Shaft and well tubes, apparatus for lowering and sinking, (124,) J. Chaudron 136,031
Shovel and spade, (141,) Wells and Morehouse 135,954
Sieves, construction of metallic, (170,) R. J. Mann 135,925
Sieves, construction of metallic, (170,) R. J. Mann 135,926
Silver ore, treating, (3,) J. H. Selwyn 136,102
Siphon, (167,) N. W. Paynter 135,935
Skylight, (30,) G. E. Clarke 135,893
Slate cleaner, (146,) F. Hickman 136,058
Soda fountain, (1,) W. H. Russel 135,940
Sole edge setting tool, (16,) J. H. Morrison 136,087

Sole edge trimming tool, (16,) I. R. Rogers 136,096
Spike extractor, (29,) Prescott and Barsaloux 136,093
Spindle bolster, (87,) J. Barnes 135,960
Spinning machines, spindle for, (142,) D. H. Rice 135,939
Spinning, ring rail and holder for, (142,) Spaulding and Carroll 135,944
Spittoon, (62,) J. L. Howard 136,060
Spring, India rubber, (138,) A. Magowan 136,079
Stalk chopper, (73,) C. L. Spielman 136,106
Starch, manufacture of, (145,) C. Gilbert 135,904
Staves, machine for jointing, (40,) R. W. George 135,903
Stone, machine for cutting, (133,) C. E. Odgers 136,001
Stove grate, (154,) A. M. Harris 135,909
Stove, lamp, (65,) F. Janke 136,063
Stove pipe damper, (154,) E. K. Dean 136,042
Stove pipe elbow machine, (136,) Beckmann and Gibson 135,880
Strainer, pulp, (66,) H. H. Olde 136,002
Table, folding, (62,) J. F. Birchard 135,881
Table, game, (143,) L. A. Powers 136,092
Table, frowing, (91,) J. R. Groves 136,056
Tan, machine for desiccating, (92,) C. H. Mosely 135,999
Thill coupling, (31,) J. Low 136,078
Tobacco for packing, shaping, and arranging, (160,) Earlokson and Harris 135,897
Tonga, flooring, (29,) E. J. Houston 133,916
Torpedo, (71,) C. Nelson 136,000
Trape, casting stench, (33,) J. E. White, (reissue) 5,291
Trace carrier, (33,) R. H. Warriner 135,951
Truck, hand, (121,) J. J. Collingbourne 135,889
Type casting machine, (164,) J. A. T. Overend 136,091
Type setting machine, (117,) W. H. Baldwin 136,018
Uterine supporter, (156,) G. Dirksen 136,046
Valve stems, steam tight joint of, (152,) G. R. Babbitt 135,876
Ventilating water closets and urinals, (8,) R. D. O. Smith 136,106
Vessel, armor clad, (136,) L. Goddu 136,055
Washing machine, (91,) W. H. Freed 136,050
Washing machine, (91,) J. Wilbur 135,955
Water wheel, (168,) N. J. Colman 135,891
Wheels, machine for forming cutters for cutting the teeth of, (100,) W. Sellers 136,101
Window screen, (121,) C. W. Fowler 135,901
Wire basket, (66,) D. Sherwood 135,943
Wood, polishing, (70,) C. Seebach 136,010
Wrench, pipe, (100,) E. S. Moulton 136,089

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 18, 1873.

Alexander, C. M., assignee 136,099
Alexander, J., Coal mining machinery 135,874
American Clutch Company, assignee 136,019
Atherton, G., Horse hay fork 136,016
Atkins, G., Reverberatory furnace 136,017
Atkins and McAninch 136,083
Austin, C., Reed organ 135,875
Babbitt, G. B., Steam tight joint of valve stems 135,876
Babcock, G. H., and S. Wilcox, Sectional steam boiler 135,877
Babcock, J. W., Machine for lifting and carrying barrels, boxes, &c. 135,958
Bailey, H. D. W., Spring bed bottom, (reissue) 5,286
Balderston, J., Bread worker 135,950
Baldwin, W. H., Type setting machine 136,018
Barber, R. P., assignee 135,948
Barker, J. C., Folding case 135,878
Barnes, J., Spindle bolster 135,960
Barsaloux and Prescott 136,093
Barthel, P., Treating asphalt 135,879
Bartlett, G. E., assignee 136,096
Bartlett, L., Fly catcher 135,961
Bates, F. G., Railroad car brake 136,019
Baughman, H., Saw gummer 135,962
Beckmann, J., and J. Gibson, Stove pipe elbow machine 135,880
Beckwith, R. E., Sash fastener 135,963
Bedesem and Bowen 135,965
Beecroft, N. D., Hoe 136,020
Behel, J., Cultivator 135,964
Benedict and Burnham Manufacturing Company, assignee 136,113
Benson, J., and A. H. Watkins, Vapor burner 136,021
Benson, J., and A. H. Watkins, Vapor burner 136,022
Bigelow, A., Lemon squeezer 136,023
Bigelow, L. A., trustee, assignee 136,084
Birchard, J. F., Folding table 135,881
Bosson, P., and M. Bedesem, Bed bottom 135,965
Bolin, J. P., Water regulator 136,024
Bonney, C. S., Clamp 135,882
Bonney, C. S., Saw filing vise 135,883
Booth, G., Metal coated ware 136,025
Boyle, J., Awning 135,966
Branson, J. L., assignee 135,878
Brittan, J. and A., assignees 135,116
Brooks, J. W., trustee, assignee 136,074
Bronson, E. D., Broom bag 136,026
Browne, C. B., Carpet fastener 135,884
Brown, W., Harrow 136,027
Brush, A. G., Potato digger 136,028
Buck, H., Apparatus for elevating and unloading hay 136,029
Buckley, C., Curtain fixture 136,030
Bush, I., Spring bed bottom 135,885
Bush, I. D., Furnace for melting brass and other metal 135,967
Bushnell, W., Manufacture of iron 135,886
Carré, F. P. E., Ice machine, (reissue) 5,287
Carré, F. P. E., Manufacture of ice, (reissue) 5,288
Carroll and Spaulding 135,944
Cauvet, L. A., assignee, (reissue) 5,291
Chandler and Pennock 136,004
Chapman, L. J., Bolt cutter 135,887
Chaudron, J., Apparatus for lowering and sinking shaft and well tubes 136,031
Chess and Hollis 135,915
Clarke, G. B., Skylight 135,888
Clarke, N., Hat rack 136,032
Coffin, G. W., Car coupling 136,033
Cole, C. G., Hat and coat book 135,968
Coleman and Dean 136,043
Collingbourne, J. J., Hand truck 135,889
Collins, W. T., Car coupling 135,890
Colman, N. J., Water wheel 135,891
Combe, A., Wick raiser for lamps 136,034
Converse, G. C., Machine for pricking leather 135,969
Cooke, A. A., G. L. and S. W., assignees, (reissue) 5,290
Cooke, W. Z., Spring bed and frame 135,892
Coombes, N., assignee 135,911
Combes, W. M., Churn dasher 136,035
Cooper, W. B., Iron bridge 135,970
Craven, W. D., Preparing blood for fertilisers 136,036
Critchlow, T., Punching bolt holes in steel railroad rails 136,037
Crooker, H. D., Clothes washer 136,038
Crosthwait, G. D., Car coupling 136,039
Crowley, J. J., Car ventilator 135,977
Darrell, A. M., Trunk hinge 136,040
Davis, W. H., and R. V. De Guinon, Steam boiler 136,041
Day, A., Button hole cutter 135,893
Dean, A. B., and T. C. Coleman, Railroad rail 136,043
Dean, E. K., Stove pipe damper 136,042
Dearing, O. A., Printer's lead rack 135,894
De Guinon and Davis 136,041
De Leidi, R., Propulsion of cars 135,972
Delouest, A. E., Stop cock and regulator for gas burners 135,895
De Mestre, A., Bottle stopper 136,045
Dirksen, G., Uterine supporter 136,046
Dirst, A. L., Clod fender 135,896
Doremus, W. T., Seat for chairs, &c 135,973
Doremus, W. T., Oscillating chair 135,974
Draper, I. C., Fruit fork 135,975
Eames, F. W., Cut off for fire plug systems 135,976
Earickson, J. K., and J. R. Harris, Shaping and arranging tobacco for packing 135,897
Edwards, D., Cultivator 136,047
Elliott, G. R., Game board 136,048
Elmer, W., Gasifying fuel for heating, &c, (reissue) 5,289
Elmer, W., Manufacture of inflammable gases for fuels, &c., (reissue) 5,294
Elwell, H. H., Door lock 136,049
English, T., Screw bolt and nut 135,898
Fay, C. T., Car axle box 135,977
Feeman, J., assignee 136,010
Fagerty, T. B., Gas burner 135,978
Fogarty, T. B., Gas burner 135,979
Fogarty, T. B., Gas machine 135,980
Fogarty, T. B., Carburetor 135,981
Fogarty, T. B., Carburetor 135,982
Foote, E., Grain band, bag tie, &c 135,899
Forster, F. E., Fishing line 135,900
Fouke, P. B., assignee 135,922
Fowler, C. W., Window screen 135,901
Freed, W. H., Washing machine 136,050
Freeman, H. O., Making cheese 136,051
Friedman, N., assignee 135,914
Frye, J., Endless rolling gear for railroads 136,052
Frye, J., Wheel for endless railways 136,053
Frye, J., Platform carrier for endless railways 136,054
Gardner, H. D., assignee 136,051
Gates, A., Scaffold 135,902
Geemen, J., Medical compound 135,983
George, R. W., Machine for jointing staves 135,903
Gibson and Beckman 135,880
Gilbert, C., Manufacture of starch 135,904
Gill, C. B., Pump piston 135,905
Gillam, J. W. and J. W., Jr., Car coupling 135,984
Goddard, C. F., Grain binding harvester 135,985
Goddu, L., Armor clad vessel 136,055
Goodwin, S. A., Condenser for steam engines 135,906
Greenwood, G., Rotary cutter head for matching boards 135,907
Groves, J. R., Ironing table 136,056
Gullman, C., Sewing machine 136,057
Haberstich, P., Barber's chair 135,986
Hall, W. DeL., Automatic fan 136,044
Hardekopf, C. J., Kite 135,987
Hargrave, T. C., Steelyard scales 135,908
Harris, A. M., Stove grate 135,909
Harris, J., Sectional steam boiler 135,910
Harris, W. A., assignee 135,876
Harris and Earickson 135,897
Hawkins, L. P., Heel nailing and shaving machine 135,911
Hewitt, Mooney and Young 136,121
Hickman, F., Slate cleaner 136,058
Hinckley, G. A., Machine for operating and feeding oil well drills 135,988
Hinckley, J. B., Cultivator 135,912
Hobbs, A. C., Cartridge loading machine 135,913
Hodges, S. H., assignee 136,060
Hoffman, A. D., Door spring 135,914
Hohorst, F., Sling for raising animals 136,059
Hollis, S. P., and H. B. Chess, Machine for cutting nails 135,915
Holmes, B., Bed bottom 135,989
Hood, G. E., assignee 136,060
Hood and Kidder 136,070
Hough, J., assignee 136,108
Houston, E. J., Flooring tongs 135,916
Houston, E. J., Mortising machine 135,917
Howard, J. L., Spittoon 136,060
Hufeland, P., Lead pencil 136,122
Huffer, A., Blind hinge 136,061
Humphrey, A. N., Gang plow 136,062
Huntington and Swingle 135,947
Hyatt, I. S. and J. W., Toilet comb 135,918
Janke, F., Lamp stove 136,063
Jensen Lubricator Company, assignee 135,977
Johnson, A., Propelling canal boats 136,064
Johnson, H. M., Ripper and rag looper 136,065
Johnson, W. J., Apparatus for condensing and purifying the smoke of metallurgic furnaces 136,066
Johnston, A., Tuck creaser for sewing machines 135,919
Jones, J. B., Car starter 135,920
Kendrick and Ogborn 135,933
Kenfield, J. Jr., Water heater 135,921
Kern, J. W., Railroad bed 136,067
Kern, J. W., Car wheel 136,068
Kidder, J. H., Ink well 136,069
Kidder, J. H., and G. E. Hood, Inkstand 136,070
King, W. H., Pocket book 135,990
Kingwill, J. F., Ratchet pinion 135,991
Kinne, E. M., Fastening for halter rings 136,071
Kisor, J., Fruit gatherer 136,072
Kittle, J., Combination padlock 135,992
Knorr, J. F., Harness mounting 136,073
Knowlton, A., Nail selecting and delivering machine 136,074
Krein, J., assignee 136,011
Lendrum, Z. P., Horse power 136,075
Lang, G. P., Jr., Molasses pitcher top 136,076
Lang, J. C., Floating fire engine 135,922
Lardiskey and Onion 135,934
Larkin, W. D., assignee 135,934
Larrabee, B. F., assignee 136,080
Latham, C. H., assignee 135,943
Laughlin, J. M., Horseshoe nail machine 135,993
Liston, R., Safety latch for railroad cars 135,923
Lofink, F., assignee 136,095
Lovell, G. W. C., Case for heating sad irons 136,077
Low, J., Thill coupling 136,078
Lyon, I. W., Dentist's stool 135,924
Macowitsky, C. P., Vibrating propeller 135,994
Magowan, A., India rubber spring 136,079
Maloney, J. A., assignee 135,952, 135,953
Maloy, J. W., Machine for trimming, &c., the edges of boot and shoe soles 136,080
Mann, R. J., Construction of metallic sieves 135,925
Mann, R. J., Construction of metallic sieves 135,926
Matthews, J. R., Canning fruit 135,927
Maynard, E., Breech loading fire arm 135,928
Maynard, W., Apparatus for the manufacture of gases 136,081
Maynard, W., Treating hides and skins 136,082
McAninch, J. C., and G. Atkins, Fettling for puddling and boiling furnaces 136,083
McCracken, E. D., Gas lighter 136,084
McDougal, A., Insect destroying and disinfecting compound, (reissue) 5,292
McDougal, J., Fertilizer 135,995
McKay, C., assignee 135,885
McKnight, D. M., assignee 136,050
McMahon, P. J., Steam generator 135,996
Merriman, M. H., assignee 136,061
Mikinas, C., assignee 135,986
Middleton, E. C., assignee 136,118
Middleton, N. and A., Jr., Manufacture of car springs 135,929
Mignon, J. B. J., assignee, (reissue) 5,287, 5,288
Millar, J. S., assignee, (reissue) 5,293
Miller, H., Can for paints, liquids, &c 135,085
Mills, J., Cultivator 135,997
Minter, T. W., Engraving and carving machine 135,998
Mohr, W., Rocking chair 136,086
Mooney, Young and Hewitt 136,121
Moore, J. C., Sewing machine 135,930
Morehouse and Wells 135,954
Morrill, F., assignee 136,049
Morrison, J. H., Sole edge setting tool 136,087
Morton, E. W., Mechanical power 136,088
Moseley, C. H., Machine for desiccating tan 135,999
Moulton, E. S., Pipe wrench 136,089
Nelson, C., Torpedo 136,000
Nesbitt, J. D., Cushion and sharpener for sewing machine needles 135,931
Noah, G. G., Machine and process for making paste, (reissue) 5,289
Norfleet, T., assignee 136,040
Norwalk Lock Company, assignee 136,049
Nye, S. R., Grain drill 135,932
Odgers, C. E., Machine for cutting stone 136,001
Ogborn, H., and A. W. Kendrick, Bed bottom 135,933
Olds, H. H., Pulp strainer 136,002
Oliver, H. N., Raising piano forte lid 136,090
Onion, J. H. W., and W. H. H. Lardiskey, Machine for cutting saw teeth 135,934
Ough, W., Sulky plow 136,003
Overend, J. A. T., Type casting machine 136,091
Paynter, N. W., Siphon 135,935
Pennock, A. J., and T. A. Chandler, Device for cutting pipes, &c 136,004
Phillips, C. A., Bosom pad 135,936
Poh and Raichle, assignees 135,895
Potwin, W. S., Slop jar 135,937
Powers, L. A., Game table 136,092
Pratt, R. N., assignee 135,950
Prescott, G. A., and J. Barsaloux, Spike extractor 136,093
Quin, M., Bale tie 135,938
Rappleye, J. W., Wire fence 136,094
Reiner, H. F., Bottle stopper 136,095
Renevey and Tailbouis 136,012
Rice, C. J., assignee 135,939
Rice, D. H., Spindle for spinning machines 135,939
Richardson, G. R., assignee 135,964
Robbins, S. N., Hat and coat guard 136,005
Roberts, C. H., Gas lighting torch 136,006
Robinson, S. W., and D. V. Wood, Machine for drilling rock, (reissue) 5,295
Rogers, I. R., Sole edge trimming tool 136,096
Roll, J. J., Bed or cradle guard 136,097
Rose, I. M., Embroidering attachment for sewing machines 136,098
Rouart, H. S., assignee, (reissue) 5,287, 5,288
Ropes, E. H., assignee 136,058
Russell, A., Folding rocking chair 136,099
Russel, W. H., Soda fountain 135,940
Sarsfield, J. C., Valve for gas regulators 136,007
Schalk, E., Oil still 136,008
Schwaab, A., Barber's chair 136,009
Sears, G. E., assignee 136,117
Seebach, C., Polishing wood 136,010
Sellers, W., Riveting machine 136,100
Sellers, W., Machine for forming cutters for cutting the teeth of wheels 136,101
Selwyn, J. H., Treating silver ore 136,102
Shaw, T., Planing machine 135,941
Sheer, J., Corn planter 135,942
Sherman, W. B., Measuring can for oils, &c 136,103
Sherwood, D., Wire basket 135,943
Silber, A. M., and F. White, Portable lamp cooking apparatus 135,104
Smith, H. D., & Co., assignee 136,112
Smith, R. D. O., Ventilating water closets and urinals 136,105
Spaulding, G. W., and W. T. Carroll, Ring rail and holder for spinning 135,944
Spielman, C. L., Stalk chopper 136,106
Squires, J. A., Stay log 135,945
Squires, R. S., Dinner pail 135,946
Starr, E. F., assignee 135,917
Strowbridge, J. W., Seeding machine 136,107
Succop, J. R., Car coupling 136,011
Swickard, J. W., Cultivator 136,108
Swingle, A., and F. A. Huntington, Magazine fire arm 135,947
Taber, W. D., assignee 135,906
Tailbouis, E., and A. Renevey, Knitting machine 134,012
Taylor and Towne 135,949
Temple, J., Car coupling 135,948
Todd, H. B., Eaves trough hanger 136,109
Towne, H. R., and W. H. Taylor, Ink pad 135,949
Traphagen, H. L., Curtain fixtures 135,950
Tucker, W., Saw gummer 136,110
Ward, G. H., Boot and shoe fastening 136,111
Ward, W. S., Tool for milling carriage shaft eyes 136,112
Warriner, R. H., Trace carrier 135,951
Watkins and Benson 136,021
Weatherhead, O. E., Dividers, (reissue) 5,290
Weeden, W. N., Lamp burner 136,113
Weiss, R., Hook 136,114
Welch, E. P., Middlings purifier 135,952
Welch, E. P., Middlings purifier 135,953
Wellby, J., Railway dust preventer 136,013
Wells, W. T., and G. E. Morehouse, Shovel and spade 135,954
Wheelock, A., assignee 135,969
Whitaker, E. V. Glove 136,115
Whitcomb, J. B., Carriage spring 136,116
White, J. E., Casting stench traps, (reissue) 5,291
White, J. N., Rice cleaning machine 136,117
White and Silber 136,104
Wickersham, W., Nail for attaching soles to boots and shoes 136,014
Wilbur, J., Washing machine 135,955
Wilcox and Babcock 135,887
Wilson, M. M., Screw propeller 136,015
Winchell, J. F., Fare box 136,116
Winslow, C., Elastic material for boot and shoe gores 136,119
Wood and Robinson, (reissue) 5,295
Woodhouse, J., assignee 175,960
Woods, E. P., assignee 135,943
Woolever, L. B., Staff gage for dressing millstones 135,956
Woolredge, J., assignee 136,090
Worrell, T. B., Permutation lock 135,957
Wyman, G. D., Plow 136,120
Young, D. W., J. Hewitt and L. Mooney, Sad and fluting iron 136,121

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. Fifty-two volumes per year (an issue takes place every Tuesday) was found to fill up the shelves of the libraries so fast as to make the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office; and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

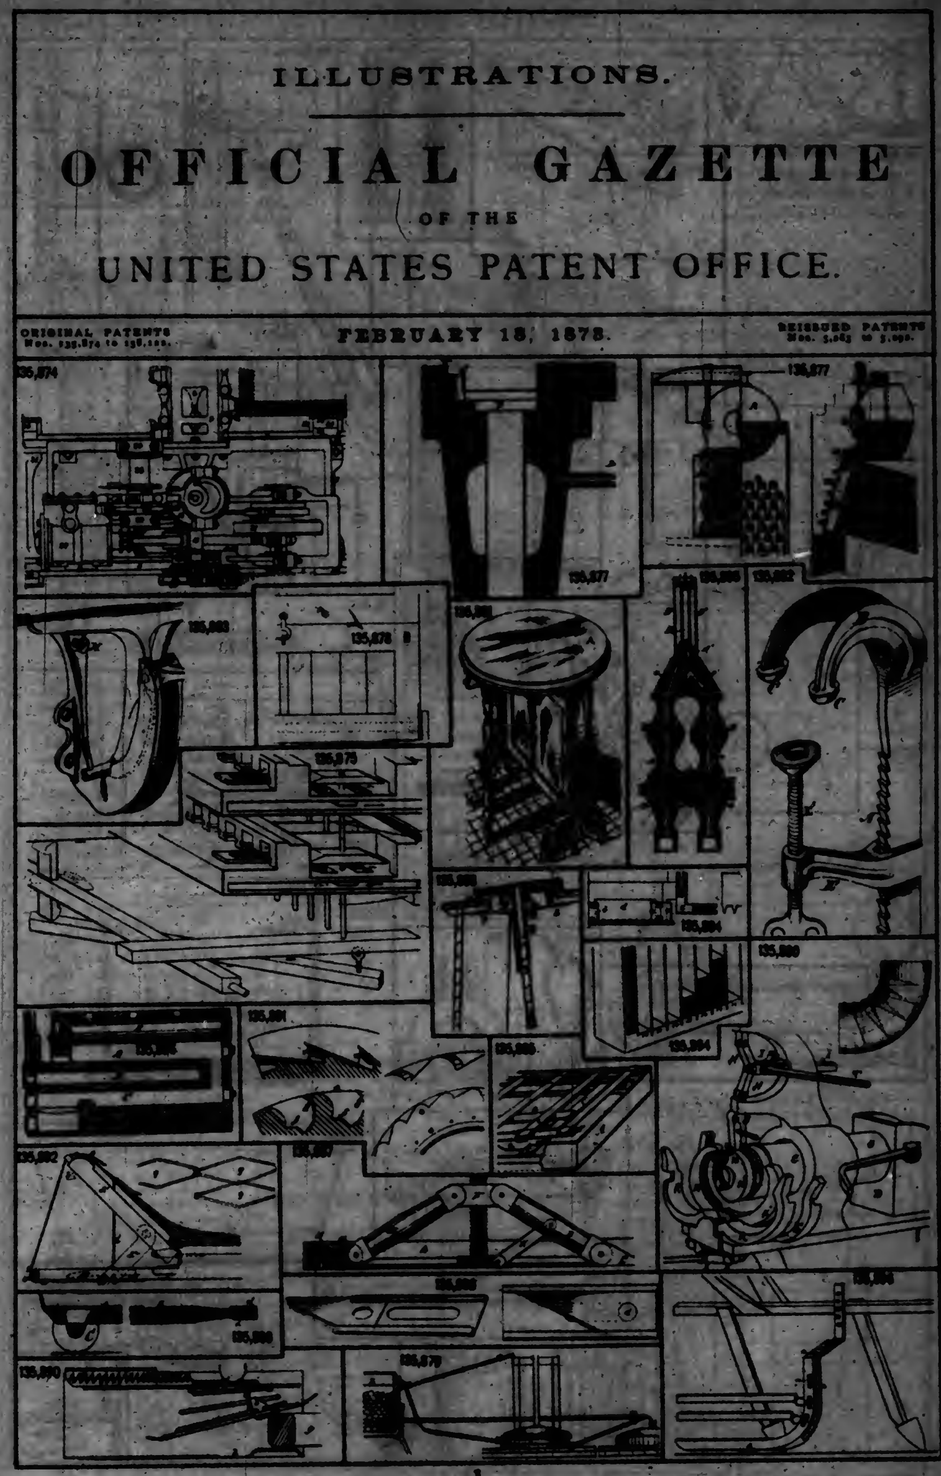
In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

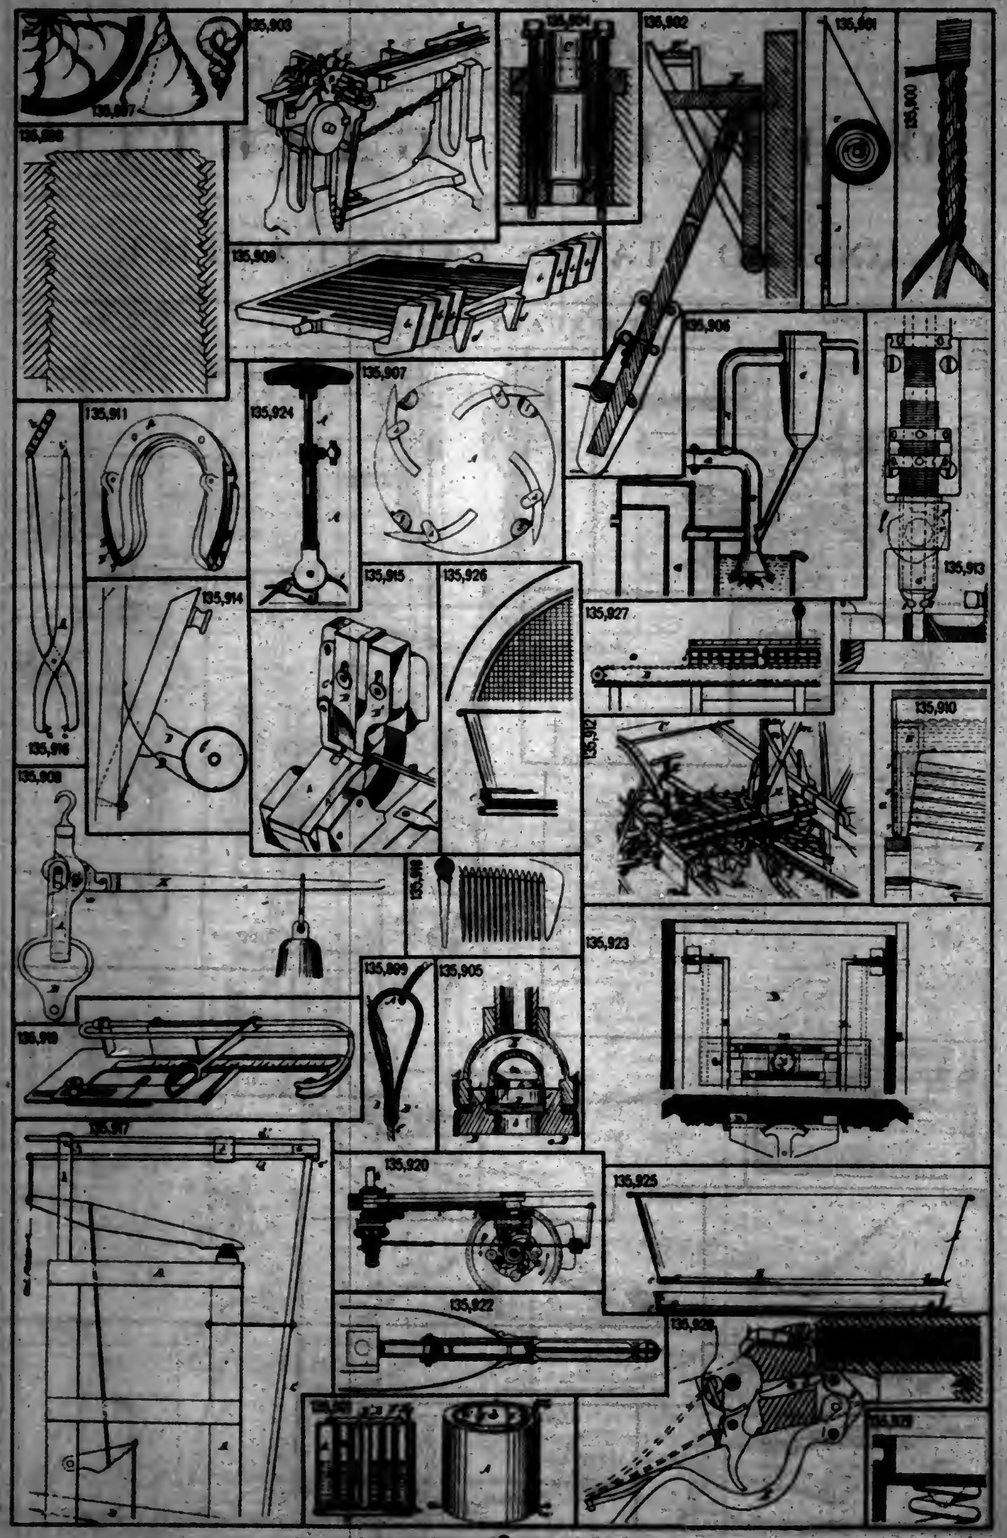
COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

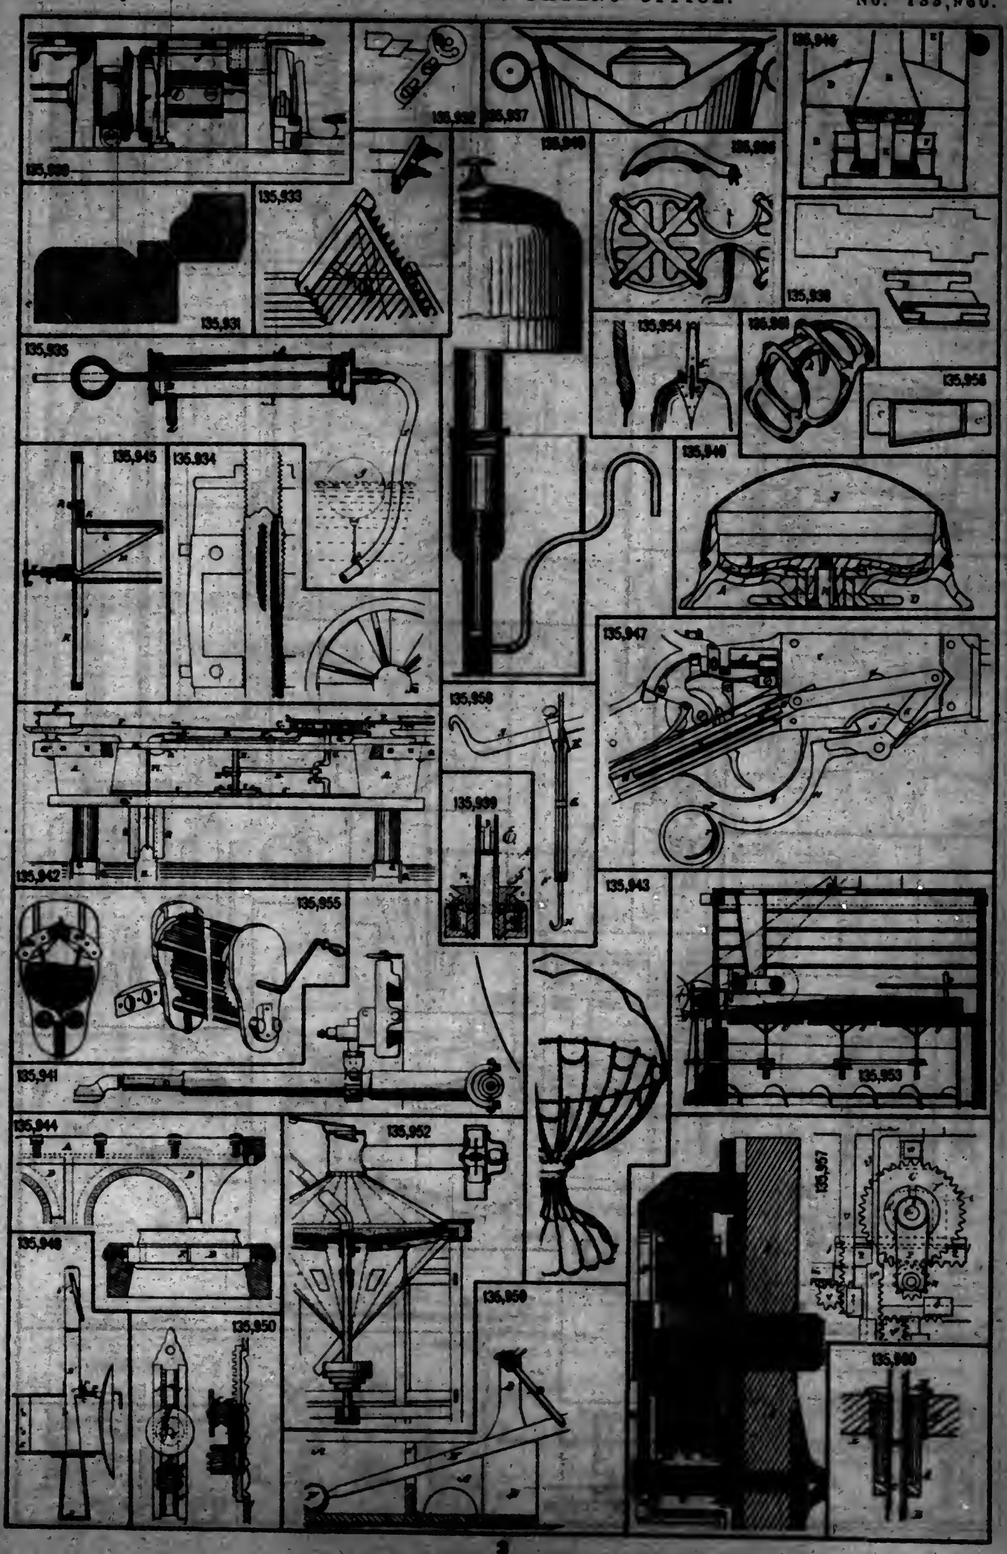


Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.



In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.



HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks).....	6,500
SEWING-MACHINES and attachments.....	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.....	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs.....	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 30, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper

COMMISSIONER'S DECISIONS.

FREEMAN GRAHAM.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Freeman Graham for a patent for alleged* IMPROVEMENT IN HARVESTERS.—*Decided February* 21, 1873.]

ABANDONMENT.

Where some proceeding of the Office is relied upon as having taken place within two years, in order to avoid a charge of abandonment under section 32 of the act of 1870, such proceeding must be interlocutory, or have had reference to the merits of the case, and be something more than a merely ministerial action.

If no steps are taken toward prosecuting an application for two years after notice of the last action of the Office upon it, except to enter a formal abandonment and request a return of the model, it must be considered as having been abandoned.

The objection is not removed because in the meantime the Office has filed the formal abandonment and permitted the applicant to withdraw his model.

THACHER, *Acting Commissioner:*

The facts in this case are as follows: Graham filed an application for patent in 1870, which was partly rejected and information sent him by official letter dated October 31, 1870. January 3, 1871, he filed a formal abandonment of this application, which action was indorsed on the file. December 3, 1872, filed a new application containing the subject-matter of the old, which he wishes to have considered as a continuation of the latter.

The Examiner refuses to consider the new application, holding that under section 32, act of 1870, the old application has been finally abandoned, unless it be shown that the delay to prosecute was unavoidable.

As the new application was not filed until more than two years after the date of official letter in the former case, the Examiner is undoubtedly correct, unless the official permission to withdraw the model, and indorsement of abandonment on the back of the file, can be regarded as an "action therein" in the sense in which these words are used in the 32d section.

The Commissioner is asked to take the latter view. I am satisfied, however, that this would not be correct practice. The law evidently contemplates official actions either preliminary or on the merits, taken in the regular course of examination of the case. The abandonment of an application or withdrawal of model requires no such action. It is an act of the applicant, not of the Office—the withdrawal of the model requiring the permission of the Commissioner, it is true, a mere ministerial act—but no part of the transaction requiring official action materially affecting the condition of the application before the Office.

As applicant has not shown that the delay to prosecute for more than two years after last action therein was unavoidable, the decision of the Examiner must be sustained.

T. B. OGLESBY.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Thomas B. Oglesby for patent for* COTTON-GIN SAW.—*Decided February* 24, 1873.]

DESIGN PATENT—MECHANICAL PATENT—FORM—FUNCTION.

When an alteration in any article is calculated to give it a better appearance merely, it can be protected only by a design patent.

If the alteration is intended to change its functions or improve its operation, or effect a new result, it may be the subject of a mechanical patent.

LEGGETT, *Commissioner:*

Applicant claims a peculiarly-shaped saw-tooth for cotton-gins, on account of the construction or form of which several important advantages are alleged to be gained, referring both to the cost of making the tooth and to its use in ginning. No question is made by the

Examiner as to the novelty or utility of the tooth, but he maintains that as it exhibits merely a change of form it is therefore proper subject-matter for a design patent only. This position is not tenable in this case. Admitting that there is no more than a change of form in the tooth itself, it is necessary to go further and inquire what is the object and what are the results of the change of form. If the shape of the tooth has been altered for the purpose of improving its appearance merely, without changing its function or increasing its practical efficiency, then the modification is calculated to produce the novelty and utility requisite to warrant the grant of a design patent. But if the shape of the tooth has been altered for the purpose of improving its operation, and actually does, as alleged, greatly increase its efficiency, then there is clearly presented subject-matter for a mechanical patent. When the common screw was simply provided with a pointed instead of a blunt threaded end there was only a change of its form, and seemingly a very slight and obvious one. Yet the object of the change and the advantages resulting from it rendered it an important and patentable mechanical invention. This case is analogous, and the Examiner's decision must therefore be overruled.

W. D. LEAVITT.—*Motion.*

[*In the matter of the application of W. D. Leavitt, filed September 28, 1860, for patent for* CHECKS FOR COTTON-BALES, WOOL, &c.—*Decided February 14, 1873.*]

ABANDONMENT—PRACTICE IN INTERFERENCES.

If an applicant neglects to prosecute his application for two years after the Office have rejected it, it will be held to be abandoned under the 32d section of the act of 1870, unless he shows that the delay was unavoidable.

Although the Office afterward conclude that the invention was patentable, this will not alone prevent the operation of the statute.

An interference may be declared, however, between it and a subsequent application covering the same invention, in which it may be shown that the delay was unavoidable; but unless the applicant does this he cannot have a patent, although he prevails on the question of priority.

LEGGETT, *Commissioner:*

Leavitt filed his application for a patent September 28, 1860, and was rejected the second time on the ground that his application did not cover patentable subject-matter. January 11, 1870, April 22, 1870, another applicant presented the same subject-matter in the Office for patent, and was rejected by reference to the application of Leavitt. June 21, 1870, the subsequent applicant requested an interference with Leavitt, which was refused by the Examiner, and the applicant was rejected on the same grounds that Leavitt had been. Finally, on August 13, 1872, the Examiner changed his opinion as to the patentability of the subject-matter of the two applications, and advised both applicants of a probable interference. As more than two years had elapsed since Leavitt had been notified of the last rejection of his application, during which time he had made no effort to prosecute it, the Examiner suggested to him that under the circumstances he ask leave of the Commissioner to have his case treated as still pending. He did not act upon this suggestion, however, and in the meantime the cases passed into the hands of another Examiner, who twice rejected the second applicant, the last time citing additional references, and then, on November 11, 1872, placed the two applications in interference. Now Leavitt presents a statement of the facts of his case, and asks that it be regarded as pending, under authority of section 32 of the statute, which declares that upon failure of an applicant to prosecute an application within two years after any action therein, of which notice shall have been given him, his application shall be considered as abandoned, "unless it be shown to the satisfaction of the Commissioner that such delay was unavoidable." There is no attempt to show that the delay has been unavoidable. On the other hand, it is virtually admitted in the statement presented that it has not been. But it is urged that, by the admission of the Office, it was the error of the Examiner that caused the delay. This is not the logic of the case. The law was made in contemplation of just such errors as this, and it provides a remedy for them. It limits that remedy as to time, however, and warns applicants that they cannot delay to avail themselves of it beyond two years without incurring the penalty of abandonment of their applications. It is therefore the fault of Leavitt, and precisely the fault the law specifies, that works abandonment of his application. It is clear that he cannot be allowed a patent as his case now stands. His application is abandoned and dead, unless he can show that his delay has been "unavoidable." It is still a pending application for that purpose. But is it a pending application for the purpose of an interference? The statute provides for an interference only with pending applications and unexpired patents. If priority is adjudged in Leavitt's favor, he cannot have a patent until he justifies his delay. All he can do is to defeat the grant of a patent to the subsequent applicant. It is possible he might show his delay to have been unavoidable after a decision of priority in his favor, should such a decision be made. At any rate it is in accordance with the spirit of the law that, under such circumstances as are here presented, the questions of priority of invention and abandonment be investigated before a patent is granted, and there is no way to do it except by means of an interference. Leavitt's application may therefore be treated as a pending application for the purposes of this interference, but a patent will not be granted him until he shows his delay to have been unavoidable.

WM. BROWNLIE.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Wm. Brownlie for patent for* MANUFACTURE OF SHOW-TABLETS, *filed April 26, 1871.—Decided September 6, 1872.*]

A claim for "the constructing of show-tablets in the manner described" is really for the method, and not for the act of constructing as the language indicates, and the true object should be presented in direct terms, without any such ambiguity.

The decision of the Examiners-in-Chief sustaining the action of the Examiner affirmed, although founded upon a reference not given by him, but described in an application which he had cited.

Strictures upon the practice of giving numerous references bearmore or less directly on the case, instead of citing those only which are pertinent to the claim.

LEGGETT, *Commissioner:*

Applicant claims "the constructing of show-tablets in the manner hereinbefore described, or any mere modification thereof." It would have been proper for the Examiner to have objected to this form of the claim. Its effect is to cover the method presented merely, and not the *act* of constructing in the manner, &c., as the language indicates. Therefore it should be required to accomplish that object directly and perspicuously, and not in the roundabout way adopted. It would be much better if it read, *the method of constructing show-tablets herein described.* Applicant's method is, however, fully met in the patent of A. O. Dayton, March 12, 1850, indirectly referred to by the Examiner. Dayton applies a photograph to glass by a proper adhesive substance, varnishes it to render it transparent, and then paints the back of the paper as does applicant. He describes soaking the paper previous to sticking it to the glass, and also rubbing it off before coloring with paint; but he adds, "If the paper be very thin, the soaking and rubbing may be dispensed with." So with that qualification his process is precisely applicant's. This case presents an irregularity of practice which should not occur, and it is altogether chargeable to the Examiner. None of the references he has cited are at all pertinent; but one of them—the application of Humphrey—contains a reference to the patent of Dayton in the body of the specification, and a partial description of his process of treating photographs, to which the Board have alluded and which cannot be ignored. This patent should have been expressly cited. In other words, a more careful examination should have been made, and such matter, and such only, as is in point should have been brought into the case. It is vexatious to all concerned to cite a number of random references, all different from each other, and for that reason impossible to apply to meet a specific claim.

The decision of the Board is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

J. L. SMITH *et al. vs.* ROBERT REYNOLDS *et al.*

[*In Equity.—Before Blatchford, Judge.—Decision June 30, 1872.*]

EVIDENCE OF THE PROPER REGISTRATION OF A TRADE-MARK.

The patent act of 1870 does not authorize the Commissioner to issue any letters patent for a trade-mark nor certificate containing a grant of one.

Copies certified by him of any trade-mark filed in the Patent Office, and of the date of the receipt thereof as recorded, and of the statement filed therewith in pursuance of section 77, are made evidence under section 80, and he has no authority under the act to issue any other certificate as to trade-marks.

If the copies certified by him do not include a declaration such as is required under the seventh clause in section 77, the defect is fatal.

An averment in the Commissioner's certificate that the parties have complied with the act, and that their trade-mark will remain in force thirty years, does not warrant the presumption that the declaration was filed, or remedy the defect.

It is for the Court alone to determine whether the required declaration has been duly filed and is in conformity with the law.

This was a motion for an injunction in a suit brought by J. Lee Smith & Co. against Robert Reynolds and Samuel Jacobs, doing business as Reynolds & Jacobs, to restrain the defendants from the further alleged infringement of a trade-mark, which the complainants claimed to have registered in accordance with the provisions of the act of Congress of July 8, 1870.

The only question that appears to have been considered upon the hearing of the motion was the sufficiency of the complainants' proofs as to the regularity of the registration upon which they relied. For proof upon this point they produced a certificate signed by the Commissioner of Patents, and under the seal of the Patent Office, said certificate being to this effect, viz., that "J. Lee Smith & Co., of New York, did, on the 30th day of December, 1870, deposit in the United States Patent Office, for registration, a certain trade-mark for paints, whereof a copy is hereto annexed; that they filed therewith the annexed statement; and having paid into the treasury of the United States the sum of twenty-five dollars, and otherwise complied with the act of Congress in such case made and provided, the said trade-mark has been duly registered and recorded in the said Patent Office, and will remain in force for thirty years from the twenty-first day of February, one thousand eight hundred and seventy-one."

The statement accompanying this certificate was as follows:

"To all to whom it may concern: Be it known that we, J. Lee Smith & Co., of the city of New York, of the county and State of New York, use a trade-mark for paints, of which the following, together with a fac-simile hereto attached, is a correct description. The said trade-mark consists of the illustration of a crown, as is clearly shown in the fac-simile. It is applied as a brand, by stencil-plate or die, to the casks, cases, or vessels containing the said paint, printed upon labels or wrappers which are applied to said cases or vessels, or upon the business cards, notices, or placards advertising the paints to the public."

[*John Hough*, for complainants.
Frederick Blount, for defendants.]

BLATCHFORD, *Judge:*

This bill is founded on a statutory right to a trade mark claimed under the provisions of sections 77 to 84 of the act of July 8, 1870, (16 U. S. Stat. at Large, 210 to 212.) Section 77 provides that any firm domiciled in the United States, "and who are entitled to the exclusive use of any lawful trade-mark, or who intend to adopt and use any trade-mark for exclusive use within the United States, may obtain protection for such lawful trade-mark by complying with the following requirements." One of those requirements is "the filing" in the Patent Office "of a declaration under the oath of * * some member of the firm, to the effect that the party claiming protection for the trade-mark has a right to the use of the same, and that no other person, firm, or corporation has the right to such use, either in the identical form or having such near resemblance thereto as might be calculated to deceive, and that the description and fac-similes presented for record are true copies of the trade-mark sought to be protected." On complying with these requirements the trade-mark is to remain in force for thirty years from the date of the registration.

The bill avers the filing of such declaration. The defendants, in their answer, put in issue this allegation,

among others, and require proof of the same. No proof is given that such declaration was filed. A certificate is produced, signed by the Commissioner of Patents and under the seal of the Patent Office, setting forth that "J. Lee Smith & Co.," of New York, (which is a firm composed of the plaintiffs,) did, on the 30th of December, 1870, deposit in the Patent Office for registration "a certain trade-mark for paints, of which a copy is hereto annexed; that they filed therewith the annexed statement, and having paid into the treasury of the United States the sum of twenty-five dollars, and otherwise complied with the act of Congress in such case made and provided, the said trade-mark has been duly registered and recorded in the said Patent Office, and will remain in force for thirty years from the 21st day of February, 1871."

The statement annexed to the certificate does not contain any such declaration as that referred to. The declaration is required to be "filed." The only thing certified to have been "filed" is the "annexed statement."

It is urged that the certificate that the parties have "otherwise complied with the act of Congress in such case made and provided," and that the trade-mark "will remain in force for thirty years" from the day named, covers the point; and that, in analogy to letters patent for an invention, the certificate is evidence of a compliance with the requisite preliminary steps. But I do not think this position is a sound one. A patent being authorized to be granted on evidence on which the Commissioner of Patents is to decide, the fact that he grants the patent is held to be *prima facie* evidence that the proper proofs were laid before him and were satisfactory, he being made by the statute the proper judge of the sufficiency and competency of the proofs. (*Phil. and Trenton R. R. Co.* vs. *Stimpson*, 14 Peters, 448, 458; *Seymour* vs. *Osborne*, 11 Wallace, 516, 540.) But in respect to a trade-mark the statute does not authorize the Commissioner of Patents to issue any letters patent therefor, or to issue any certificate containing a grant thereof. The only certificate he is authorized to issue in reference to the original registration of a trade-mark is that provided for by section 80, which enacts as follows: "The time of the receipt of any trade-mark at the Patent Office for registration shall be noted and recorded, and copies of the trade-mark and of the date of the receipt thereof, and of the statement filed therewith, under the seal of the Patent Office, certified by the Commissioner, shall be evidence in any suit in which such trade-mark shall be brought in controversy." A certified copy of the trade-mark, of the date of its receipt, and of the statement filed therewith—that is, a copy of everything filed and recorded, and of the memorandum of the date of the receipt thereof—is made evidence. But such copy is evidence only that what is shown by it to have been filed was filed. It is not evidence that anything required by the statute to be filed, and not shown by the certificate or by the statement annexed to it to have been filed, was filed. The certificate of the Commissioner, that the parties "otherwise complied" with the act, cannot be substituted for the judgment which a court must pass as to whether there was a declaration filed, and one under oath, and one complying, as to its contents, with the statute. The court is to judge from the "statement" whether the requirement of recording "the class of merchandise and the particular description of goods comprised in such class, by which the trade-mark has been or is intended to be appropriated," has been complied with, and whether the requirement of recording a description of the mode in which the trade-mark "has been or is intended to be applied and used" was complied with. So it is equally for the court to judge whether the requirement as to the filing of the proper declaration was complied with. The general certificate of the Commissioner cannot be taken as evidence on the subject.

The certificate that the trade-mark has been duly registered and recorded in the Patent Office, and will remain in force for thirty years from the day specified, adds no force to the effect of the certificate. The statute says that the thirty years shall run from the date of the *registration;* that the time of the receipt for registration shall be recorded, and that the certificate shall cover a copy of the date of the receipt. The date given in the certificate as the date from which the thirty years is to run is to be regarded as intended for the date of registration, and the date previously named in the certificate is the date of the receipt for registration. In this view the certificate intends to show when the trade-mark will expire, and the certificate that it has been registered and recorded, and will remain in force for thirty [years from the day named, is only equivalent to saying that such day is to be taken as the date of the registration. The date given in the certificate as the date of deposit for registration is not regarded by the certificate as the date of registration and recording.

On these grounds alone the motion for an injunction now made must be denied, without considering any of the other points raised.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

J. L. SMITH *et al. vs.* REYNOLDS & JACOBS.

[*In Equity.—Before Blatchford, Judge.—Decision July* 27, 1872.]

REQUISITES IN REGISTRATION OF TRADE-MARKS—NOVELTY IN TRADE-MARKS—WHAT MAY BE A TRADE-MARK.

Causing the name of the firm which claims a trade-mark, and its place of business, to be recorded in the Patent Office is a sufficient compliance with the first requirement of section 77 of the act of 1870, without specifying the names of those who compose the firm.

To designate "paints" as the goods for which a trade-mark is to be appropriated is sufficient, without a more particular description.

The figure of a crown used as a trade-mark for paints may indicate to buyers and dealers, by association, the origin and ownership of the same, and is of itself a lawful trade-mark.

The case of R. W. English, Com'rs Dec. 1870, p. 142, and that of the Dutcher Temple Company, ibid, 1871, p. 248, cited and approved.

Registering a figure as a trade-mark for paints in general, without any restriction as to the kind, gives no title to it if the same figure has been previously used, in connection with words or other figures, as a trade-mark for any particular kind of paint.

A trade-mark must stand or fall as a whole, and the registry of one cannot be sustained, like a patent, for a part of it, though void as to the rest.

This was a suit brought by the firm of J. Lee Smith & Co. against Robert Reynolds and Samuel Jacobs, doing business as Reynolds & Jacobs.

The facts are sufficiently stated in the opinion.

The case came up on a motion by complainants for an injunction.

[*J. Hough*, for complainants.
F. Blount, for defendants.]

BLATCHFORD, *Judge:*

The 77th section of the act of July 8, 1870, (16 U. S. Stat. at Large, 210,) provides, "that any person or firm domiciled in the United States * * * and who are entitled to the exclusive use of any lawful trade-mark, or who intended to adopt and use any trade-mark for exclusive use within the United States, may obtain protection for such lawful trade-mark by complying with the following requirements, to wit: First, by causing to be recorded in the Patent Office the names of the parties, and their residences, and place of business, who desire the protection of the trade-mark. Second, the class of merchandise, and the particular description of goods comprised in such class, by which the trade-mark has been or is intended to be appropriated. Third, a description of the trade-mark itself, with fac-similes thereof, and the mode in which it has been or is intended to be applied and used. Fourth, the length of time, if any, during which the trade-mark has been used. Fifth, the payment of a fee of twenty-five dollars, in the same manner and for the same purpose as the fee required for patents. Sixth, the compliance with such regulations as may be prescribed by the Commissioner of Patents. Seventh, the filing of a declaration, under the oath of the person or of some member of the firm, * * * to the effect that the party claiming protection for the trade-mark has a right to the use of the same, and that no other person, firm, or corporation has the right to such use, either in the identical form, or having such near resemblance thereto as might be calculated to deceive; and that the description and fac-similes presented for record are true copies of the trade-mark sought to be protected."

By section 78, such trade-mark is to remain in force for thirty years from the date of such registration, "and, during the period that it remains in force, it shall entitle the person, firm, or corporation registering the same to the exclusive use thereof, so far as regards the description of goods to which it is appropriated in the statement filed under oath, as aforesaid, and no other person shall lawfully use the same trade-mark, or substantially the same, or so nearly resembling it as to be calculated to deceive, upon substantially the same description of goods."

Section 79 provides, that if any person or corporation shall "reproduce, counterfeit, or imitate any such recorded trade-mark, and affix the same to goods of substantially the same descriptive properties and qualities as those referred to in the registration," the party aggrieved shall "have his remedy according to the course of equity, to enjoin the wrongful use of his trade-mark, and to recover compensation therefor, in any court having jurisdiction over the person guilty of such wrongful use;" and that "the Commissioner of Patents shall not receive and record any proposed trade-mark which is not and cannot become a lawful trade-mark, * * * or which is identical with a trade-mark appropriated to the same class of merchandise and belonging to a different owner, and already registered or received for registration, or which so nearly resembles such last-mentioned trade-mark as to be likely to deceive the public."

On the 30th of December, 1870, the firm of J. Lee Smith & Co. filed in the Patent Office a petition, signed by themselves, in which they are described, as "of No. 276 Pearl street, in the city of New York, county and State of New York, and engaged in the manufacture and sale of paints at said New York," and in which they represent "that they have used for fifteen months last past, are now using, and have the right to use a trade-mark for said paints, which is correctly represented and set forth in the annexed fac-simile and statement;" and pray "that said trade-mark may be registered and recorded in the Patent Office according to law." The "statement" thus referred to was in these words: "To all whom it may concern: Be it known that we, J. Lee Smith & Co, of the city of New York, of the county and State of New York, use a trade-mark for paints, of which the following, together with a fac-simile hereto attached, is a correct description. The said trade-mark consists of the illustration of a crown, as is clearly shown in the fac-simile. The crown may be of the shape and style shown, or of any other suitable form. It is applied as a brand, by stencil-plate or die, to the casks, cases, or vessels containing the said paint, printed upon labels or wrappers which are applied to said cases or vessels, or upon the business-cards, notices, or placards advertising the paints to the public." Accompanying these papers was an oath made by a person described therein as "a member of the firm of J Lee Smith & Co., and representing the firm of J. Lee Smith & Co., the above-named petitioner," and setting forth, "that, according to the best of his knowledge and belief, the description and fac-simile herewith presented for record are true copies of a trade-mark sought to be protected; that they have a right to the use of the said trade-mark; and that no other person, firm, or corporation has the right to such use, either in the identical form, or having such near resemblance thereto as might be calculated to deceive."

The Patent Office required the applicants to strike out from the "statement" these words: "The crown may be of the shape and style shown, or of any other suitable form," and they were stricken out by them. As thus amended, the trade-mark was registered on the 21st of February, 1871. Thereupon, under that date, the Patent Office issued a certificate, certifying that "J. Lee Smith & Co., of New York, New York, did, on the 30th day of December, 1870, deposit in the United States Patent Office, for registration, a certain trade-mark for paints, whereof a copy is hereto annexed; that they filed therewith the annexed statement; and having paid into the treasury of the United States the sum of twenty-five dollars, and otherwise complied with the act of Congress in such case made and provided, the said trade-mark has been duly registered and recorded in the said Patent Office, and will remain in force for thirty years from the twenty-first day of February, one thousand eight hundred and seventy-one." The "statement" and fac-simile are annexed to the certificate. The fac-simile shows one drawing of a crown.

The bill in the case is founded upon the statutory

right thus claimed to have been acquired to said trade-mark, and is filed by the members of the said firm of J. Lee Smith & Co., and alleges that the defendants are selling paint contained in casks, cases, or vessels, upon which said trade-mark, or imitation thereof bearing such near resemblance thereto as is calculated to deceive, is applied as a brand by stencil-plate or die, or by labels or wrappers, upon which said trade-mark, or said imitation thereof, has been printed, and have also used the said trade-mark, or said imitation thereof, upon the business-cards, notices, and placards advertising the defendants' paints to the public. The plaintiffs move for an injunction to restrain such use of such trade-mark.

Full proofs have been taken for final hearing on both sides, and on them the motion is made.

It is objected to the validity of the registration in this case that the names of the parties and their residences and place of business were not caused to be recorded in the Patent Office by the parties desiring the protection of the trade-mark. It is insisted that the name of each of the individual partners composing the firm and his place of residence should have been set forth. But, it is to be noted that this statute gives the privilege to any "firm domiciled in the United States," as well as to any person domiciled therein. In this view, in the case of a firm, it is sufficient if the name of the firm is given, provided the trade-mark is claimed by the firm as a firm. Giving the name of the firm is giving the name of the party desiring protection. The statute requires the declaration, under the oath of some member of the firm, to be to the effect that "the party claiming protection"—that is, the firm—has a right to the use of the same, &c. Also, setting forth that the firm is "of number 276 Pearl St., in the city of New York, county and State of New York, and engaged in the manufacture and sale of paints at said New York," is a sufficient statement of the residence and place of business of the firm, as the party desiring the protection.

It is also objected that, although the registration papers specify "paints" as the class of merchandise, yet there is no designation of the particular description of goods comprised in such class, to which the trade-mark is or is to be appropriated. But the parties describe themselves as engaged in the manufacture and sale of paints generally, which they state they use and have a right to use, and desire to have protected. They cover the whole class of merchandise called "paints," and every description of goods comprised in such class. That being clearly stated by them, any further specification was unnecessary.

It is insisted by the defendants that the illustration of a crown applied as set forth in the "statement" is not the subject of a lawful trade-mark, because it does not indicate the true origin or ownership of the paints. The statute protects only that which is or can become a lawful trade-mark. It declares that the mere name of a person, firm, or corporation cannot be a lawful trade-mark; but that such name, accompanied by a mark sufficient to distinguish it from the same name when used by other persons, may be a lawful trade-mark. *A fortiori*, a mark or device distinguishable from other marks, when used in connection with a particular article, may designate, by association in the minds of purchasers of and dealers in such article, the origin or ownership of such article, as being in a particular manufacturer, and thus be a lawful trade-mark. (*Delaware & Hudson Canal Co.*, vs. *Clark*, 13 Wallace, 311.) The practice of the Patent Office, in registering trade-marks, under the act of 1870 has been in accordance with this view, and is properly so. It has, on discussion, authorized as lawful trade-marks the letter X applied to brooms, and the letter D encompassed by the figure of a lozenge applied to loom-temples. (Commissioner's Decisions, 1870, p. 142; and 1871, p. 248.) In the case of *Morrison* vs. *Case*, (9 Blatchford, C. C. R., 548,) it was held that, under the act of 1870, the words, "The Star Shirt," and those words with the device of a six-pointed star used in connection therewith, and the device in words, "The * Shirt," used as a trade-mark in connection with the manufacture and sale of men's and boys' shirts, and taken by dealers as designating the shirts made by a particular manufacturer, are a lawful trade-mark. There can be no doubt that a simple illustration of a crown, to be applied in use as designated in this case, in connection with paints, to indicate their origin and ownership, is a lawful trade-mark under the statute.

The principal defense set up in the answer of the defendants is that, in October, 1868, the "Bridgewater Paint and Color Works Co.," then doing business in the city of New York, made a label, brand, or trade-mark, of a crown, which was used for white lead alone, of a particular quality and description, manufactured by said company for I. I. Vogt & Co., of Cleveland, Ohio, and the same being an imprint on paper, consisting of the words "Golden Crown," with the illustration of a crown underneath them, and underneath the crown an illustration of a heraldic coat of arms, and on the left of the coat of arms the words "Manufactured expressly for I. I. Vogt & Co.," and on the right of the coat of arms, "Number 32 Public Square, Cleveland, Ohio," and underneath the whole the words "White Lead;" that the said company, of which the defendant, Reynolds, was one of the corporators, having been dissolved, its business in the manufacture of paints was continued by the defendant Reynolds, and one Jacob Israel, under the name of Reynolds & Co., and the same quality of white-lead was continued to be manufactured by them, and was distinguished by a brand, label, or die, consisting of an inner circle, within which, at the top, was the illustration of a crown, and underneath that the letters "X X," and underneath those letters the words "Reynolds & Co.," and outside of such circle a second circle, and in the ring between the two circles the words, circumferentially, "Pure English White Lead;" that the copartnership of Reynolds & Co. having expired January 1st, 1872, the defendants, under the firm of Reynolds & Jacobs, continue the manufacture of the same quality of white lead, using the same brand, die, or label which had been used by Reynolds & Co. since February, 1870, as a trade-mark; and that, in February, 1870, the defendant, Reynolds, procured the brand to be made of such trade-mark for Reynolds & Co., which they and the defendants have ever since constantly and uninterruptedly used to designate a particular quality of white lead manufactured by them.

The defendants have used the illustration of a crown as a device, and as part of a brand or label, on packages containing white lead ground in oil, and on packages containing *blanc de zinc*, or zinc ground in oil. Although the device of a crown was adopted and used by the defendant, Reynolds, in the shape in which the defendants now use it, in February, 1870, and the plaintiffs did not file their first statutory papers in the Patent Office until December, 1870, yet the plaintiffs show that they adopted and used their device of a crown as early as December, 1869. In reply to this the defendants show the use by the Bridgewater Paint and Color Works Company in 1868, and from that time until its dissolution, of the device of a crown on three different forms of label, put upon packages containing paints made by them. One is the form hereinbefore referred to as set forth in the answer. Another contained the simple device of a crown and the words "Pure English White Lead. I. I. V. & Co." The other contained an illustration of a heraldic coat of arms, resembling very much the coat of arms of the Crown of Great Britain, embodying the device of a crown as an integral part of it, and the words "Pure English White Lead. Ground expressly for I. I. Vogt & Co., 32 Public Square, Cleveland, Ohio." They also show that in November, 1869, the defendant, Reynolds, purchased from the Bridgewater Paint and Color Works Company their paints, materials, and labels, and the right to use them, including the labels embodying the device of a crown. The defendant, Reynolds, has since that time continually, in his firms, used the device of a crown on some description of paints. The brand or label of the form used by the defendant, Reynolds, in his firms since February, 1870, is as near a resemblance to one at least of the three forms of label used by the Bridgewater Paint and Color Works Company as it is to the device shown in the plaintiffs' registration, and the latter is as near a resemblance to such Bridgewater label as it is to the brand or label of the defendants. It is manifest, therefore, that the plaintiffs had, at the time they registered the illustration of a crown as a trade-mark for paints generally, no right to the broad use of it for paints generally, the defendant, Reynolds, and his then firm having the right to the use of it, at least for the classes of paints for which it had been used as a label or trade-mark by the Bridgewater Paint and Color Works Company, and by the defendant Reynolds and his firm of Reynolds & Co., prior to the time of such registration. The plaintiffs registered it and claimed the right to use it as a trade-mark for paints generally, for all descriptions of paints, without reservation or exception. Whatever grant there is of it, by reason of the registration made by the plaintiffs, is of the right to use it for paints of all kinds, for the class of merchandise called "paints." The plaintiffs have not restricted themselves to any particular descriptions of goods comprised in such class. Their registration must stand or fall as a whole for that to which they declare in their registration they intend to appropriate it. There is no provision in regard to trade-marks, such as there has been and is in regard to patents for inventions, that a suit may be maintained where the grant is valid as to a part but not as to the whole. It follows, therefore, that the registration of this trade-mark in the form in which it was made conferred no right on the plaintiffs, in respect to anything purporting to be covered by it.

The motion for an injunction must for these reasons be denied.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

22,946.—*Meat-Mincer.*—Granted to ALBERT W. HALE, March 15, 1859. Hearing February 26, 1873.

22,963.—*Bottle-Stopper Fastenings.*—Granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864. Hearing February 26, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BADER, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PEIRCE, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD REBH, March 22, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 28, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,580.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GERRER, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GERRER, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMONY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,685.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,824, 4,825, and 4,826, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GEREN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GEREN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,963, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 5,259, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Oyster-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERSHON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,889.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,930.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,937.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,976.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,096.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,132.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WERSON, May 24, 1859. Hearing May 7, 1873.

24,190.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to E. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

EXTENSIONS GRANTED.

23,060.—*Improved Electro-Magnetic Fire-Alarm Apparatus*, granted to MOSES G. FARMER, February 22, 1859.

Claim.—The combination of two or more key-boards of fire-alarm strikers, constructed and operating substantially as described, with one or more electro-telegraphic alarm-machines in the same closed electric circuit, or in dependent closed circuits, by means of a mechanism that will make and break a circuit, as herein shown and described.

23,027.—*Improved Machine for Crozing and Chamfering Barrels*, granted to HIRAM LITTLEJOHN, March 1, 1859. (WILLIAM GURLEY and ELISHA WATERS, executors.)

Claim.—Crozing and chamfering barrels, kegs, or casks by turning the bulging cylinders of staves in upon or against suitable rests or supports, and around rotating cutters which turn in opposite direction to and describe circles of less diameter than the inside of the ends of the cylinders of staves; the cutters and the rests being so arranged together, and one or both of them made movable, that the cylinders of staves can be conveniently applied to and removed from the rests and cutters, substantially as herein set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 25, 1873.]

6,456.—*Ottoman.*—CHRISTIAN J. CONRADT, Baltimore, Md., assignor to G. S. GRIFFITH & Co., same place.

6,457.—*Ottoman.*—JOHN D. LADD, New York, N. Y., assignor to THE NEW YORK OTTOMAN AND HASSOCK COMPANY, same place.

6,458.—*Chair-Frame.*—ELISHA SEYMOUR and CHARLES E. SHATTUCK, Clinton, Iowa.

6,459.—*Baptismal Font.*—ANNIE E. VAN WERT, Binghamton, N. Y.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date February 25, 1873.]

1,142.—*Eye-Salve.*—WILLIAM T. BLOW, St. Louis, Mo.

1,143.—*Pearl Wheat.*—JAMES B. CLOW, Allegheny City, Pa.

1,144.—*Compound for Cleaning and Dressing Harness.*—SAMUEL E. COX & Co., New York, N. Y.

1,145.—*Pickles and Sauces.*—CRANE & COMPANY, New York, N. Y.

1,146.—*Cutlery.*—NATHAN JOSEPH, San Francisco, Cal.

1,147.—*Salve.*—GABRIELLA LONG, Keytesville, Mo.

1,148.—*Baking-Powder.*—MOODY BROTHERS, Indianapolis, Ind.

1,149.—*Plows.*—E. REMINGTON & SONS, Ilion, N. Y.

1,150.—*Gin.*—WHITING P. SANGER, New York, N. Y.

1,151.—*Pile Remedy.*—M. H. STONER, Skaneateles, N. Y.

1,152.—*Printed Publications.*—DAVID WILLIAMS, New York, N. Y.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date February 25, 1873.]

ORIGINAL PATENTS.

136,123.—*Wagon-Seat.*—JOHN G. ARMSTRONG and JACOB S. ARMSTRONG, Reed township, Seneca county, Ohio.

The bearing-blocks are so constructed that the compensating-rods may have horizontal movement, as the seat is depressed.

Claim.—1. The compensating-rods E, the lock-piece H, and the recess K, constructed and operated substantially as described, and for the purpose set forth.

2. The seat A, the spiral springs J, the strip C, the compensating-rods E, the block D, the locked piece H, and the hooked plate I, constructed substantially as described, and for the purpose set forth.

136,124.—*Machine for Making Sheet-Lead.*—DAVID G. BATCHELDER, Salem, Mass.

In the end of a stationary tubular plunger is fastened a slotted carrier, in the face of which is a dovetailed groove to receive the band-forming plate. Lead is poured into the movable receiver and allowed to set, when it is forced up, and the plunger fitting tightly in the receiver, the lead is caused to escape through the slotted plate in the form of a sheet.

Claim.—1. The arrangement and combination of the sheet or band forming slit or slotted plate D, the movable metal-receiver B, and the stationary tubular plunger C.

2. The combination of the movable chambered and grooved carrier E (for receiving and supporting the sheet or band forming slot-plate D) with the movable metal-receiver B and the stationary tubular plunger C.

3. The chambered and grooved carrier E, the separate sheet or band forming slot-plate D, the movable metal-receiver B, and the stationary tubular plunger C, all constructed and arranged together and applied to a frame, A, in manner and to operate substantially as and for the purpose as hereinbefore explained.

136,125.—*Wash-Boiler.*—MATTHEW MCPHERSON BEARD, Canton, Miss.

A raised partition or bottom forms a steam-chamber, to which perforated tubes are attached, and by which the steam is introduced upon and into the clothes to be washed. The bottom of the boiler has an opening, with a neck or flange fitted to a smaller boiler, into which the water is introduced and the steam generated and conducted to the upper one through the perforated tubes.

Claim.—The vessel A, supplied with the neck a, passage or opening a^1, chamber a^2, and punctured tubes C C', substantially as and for the purpose set forth.

136,126.—*Railroad Switch.*—HENRY BLACK, Lewisburg, Ohio.

The switch is operated from an approaching car or locomotive carrying an arm which projects therefrom and comes in contact with the curved operating-levers, the lower ends of which are cam-shaped and set upon rollers carried in a yoke, said yoke also acting as a guide for the operating-levers. The yokes are connected by rods to a pivoted plate, which is connected to the switch-rails. The operating-levers are returned to their vertical position by means of a spring.

Claim.—1. The operating levers j j^2 j^3 j^4, constructed with cam-extensions j^1 and curved, as described, to engage properly with tappet-bars z on locomotives and cars of different heights, as herein set forth.

2. The cam-levers j j^2 j^3 j^4 and horizontal hinged plates m, constructed as described, in combination with the yokes k k^2 k^3 k^4, operating-rods l l^2 l^3 l^4, and connections i n for imparting motion to the switch-rails from tappets z on the locomotives and cars, in the manner herein specified.

3. The cam-levers j j^2 j^3 j^4, adapted to act on the yokes k k^2 k^3 k^4, in the manner described, and restored to their normal position by the spring c when released.

4. The yokes k k^2 k^3 k^4, connected adjustably to the operating-rods, and permitting independent movement of the latter.

5. The jacks J, constituting bearings for the spring-levers and guides for the yokes, and constructed substantially as described and shown.

136,127.—*Bustle.*—MOSES K. BONTHER, Jackson, Mich.

The bustle has ordinary horizontal bows or springs. Midway between the sides and back two other bows, attached vertically to the horizontal bows, are bent under the lowermost bow, then forward and up and crossing each other, are attached to the waistband. A spiral spring is placed between the middle bow at the back and the cross-bows where they intersect. There is an adjusting-strap at the back.

Claim.—1. The arrangement of the band A, springs B, adjusting-cords C, expander D, springs E, brace F, adjusting-strap G, when the parts are combined substantially as described, and for the purposes set forth.

2. In combination with the above-named parts, and in an adjustable bustle constructed as described, the spiral or coil spring H, for the purposes specified.

136,128.—*Swimming-Bath.*—PATRICK BRALLEY, Oakland, Cal.

A system of pipes are laid in the bottom of the basin beneath a floor formed of strips of wood, the pipes communicating with the boiler through which steam is forced. A pipe leading from the boiler to the bottom of the basin is designed to assist in cleaning the bottom by agitating the water and loosening up the sediment by the introduction of steam. A gate is used to allow the egress of the water, and a propeller to force pure water from the outside into the bath.

Claim.—1. The basin A, constructed with a slatted floor to admit the circulation of water up through the same, when underlaid with a steam-pipe, D, and operated by means of the boiler K and steam-pipe E, substantially as and for the purposes set forth.

2. The propeller N, and gates V and S, and the steam-pipe G, when operated substantially as and for the purpose set forth.

136,129.—*Rendering Apparatus for Fats, Offal, &c.*—AMOS BROADNAX, Mont Clair, N. J.

An arched or reverberatory furnace and a steam boiler or generator, arranged so that the fire is prevented from direct contact with said boiler, and in combination with a steam-rendering apparatus.

Claim.—1. An arched or reverberatory furnace and a steam-boiler or generator arranged so that the fire is prevented from direct contact with said boiler and in combination with a steam rendering apparatus, whereby sufficient heat to generate the steam of the desired temperature is obtained in the boiler-chamber, and a high heat for the consumption of the gases and vapors is obtained in the fire-chamber, substantially as set forth.

2. A reverberatory furnace, made to concentrate and retain the heat and prevent the direct contact of the fire, as aforesaid, in combination with a rendering pan, kettle, or digester fitted with a pipe arranged to deliver or draw the gas and vapor from the digester in said furnace by the draft of the chimney leading from said furnace, when said rendering-kettle is opened or closed, as the case may be, in the manner substantially as described, and as shown in Plate 2 of the drawing.

3. A rotating rendering apparatus, tank, or digester combined with an arched or reverberatory furnace made to retain and concentrate the heat to consume or destroy the gas or vapor set free in the process, and at the same time render or refine the lard or tallow, or crisp and dry the scrap or refuse, by the dry heat of the furnace, substantially as described, and as shown in Plates 3 and 4 of the drawing.

4. A rotating rendering apparatus, tank, or digester combined in a closed chamber in connection with an arched or reverberatory furnace so as to envelop the whole tank in the heat thereof for the more effectually and economically cooking and drying the material treated, substantially as described and shown in Plates 3 and 4.

5. A rotating rendering apparatus, tank, or digester set in a chamber connected with a furnace and fitted with a stationary pipe or pipes, by which the steam, gas, or vapor can be drawn out as fast as liberated while the said tank, digester, or apparatus is in motion or at rest, as the case may be, and consumed or destroyed in the furnace, substantially as shown in Plates 3 and 4 of the drawing.

6. A rotating rendering apparatus, tank, or digester fitted with a perforated diaphragm plate or plates, by which the grease and water can drain off the top of the scrap or refuse to the bottom of said apparatus without being compelled to percolate down through the scrap or refuse, as heretofore, in the manner set forth, and as shown in Plates 3 and 4 of the drawing.

7. A steam rendering apparatus, tank, or digester combined with or connected to a steam tight receiver, into which the refuse of the tank can be drawn, drained, deodorized, and dried without exposing the same to the atmosphere, so as to create a nuisance, as heretofore, as shown in Plate 5 of the drawing.

8. Treating the soup or refuse, or either of them, from a rendering tank, apparatus, or digester or other sour animal matter, while in a closed receiver, with superphosphate of lime, for the purpose of precipitating and fixing the ammonia contained therein, substantially as described, and as shown in Plate 5 of the drawing.

9. Treating the refuse and soup, or either of them, from a rendering tank, apparatus, or digester, while in a closed receiver, with chlorine or other deodorizing gas or vapor, for the purpose of decomposing and deodorizing the offensive gases set free in the decomposition or treatment thereof to avoid making a nuisance, as set forth, substantially as described, and as shown in Plate 5 of the drawing.

10. Treating the refuse from a rendering apparatus or digester, while confined in a closed receiver in combination with said digester, with superheated steam or air, for the purpose of drying the same before exposing it to the open atmosphere, as set forth, and as shown in Plate 5 of the drawing, substantially.

11. A closed receiver to receive the refuse from a rendering tank, apparatus, or digester, and connected thereto, or to receive any other sour animal matter, fitted with a valve at one end and an escape-pipe at the other, so arranged with reference to each other as to create a draft or current from the valve to the pipe, by which the gases, if any, will be drawn up the pipe where the valve is open, as set forth, and as shown in Plate 5 of the drawing.

12. A closed receiver to receive the refuse or animal matter, as aforesaid, fitted with an escape-pipe combined with a chlorine-gas pipe or a pipe to supply a jet of chlorine, or other deodorizing gas or vapor to deodorize the escaping gases while the refuse is under treatment, as shown and described, and as illustrated by Plate 5 of the drawing.

13. A closed receiver in connection with a rendering-tank to secure the refuse, &c., as aforesaid, fitted with a nozzle to supply the superphosphate of lime or other chemicals used in the treatment of said refuse, as aforesaid, substantially as described, and as shown in Plate 5 of the drawing.

14. A closed receiver to receive the refuse or animal matter, as aforesaid, combined with an apparatus to supply chlorine or other decomposing or deodorizing gas or gases to said receiver and its appurtenances to deodorize the water, refuse, or gas and vapor set free in the operation of said receiver.

136,130.—*Metallic Cartridge.*—BETHEL BURTON, Brooklyn, N. Y., assignor to W. G. BURTON, same place.

Claim.—The improved cartridge-case herein described, drawn from sheet metal having its fibers in a general longitudinal direction, gradually bent and rounded at the base, and having a cannelure and shoulder, substantially as and for the purposes set forth.

136,131.—*Sulky-Harrow.*—WILLIAM CORBAN BYE, Collette, Ind., assignor to himself and JACOB BOSWORTH BLAZER, same place.

The harrow is supported upon a pair of wheels by means of chains, which supply the means of draft. Behind the axletree is mounted a rock-shaft, having arms which are connected by chains to the harrow-frame. By partially rotating this rock-shaft the harrow is elevated from the ground.

Claim.—The harrow E, suspended from the truck by the chains F and G, in combination with the lifting-chains H, arms I, and rock-shaft J K, substantially as specified.

136,132.—*Water-Tank for Railway Stock-Cars.*—JAMES B. CALKINS, Pacific, Mo.

A tank is secured to the truck and connected with the tender of the engine by pipes, which allows of both tender and tank to be filled with water at the same time. A pump is placed on top of the tank, and connects, by means of pitman and crank, with a wheel, over which runs a belt, which also passes around a fixed pulley upon the axle of the truck, the belt passing through a tight compartment in the tank; a pipe descends nearly to the bottom of the tank from the pump; the water is forced through hose to the different cars of the train.

Claim.—The tank A, pump B operated by axle c, pulleys c^1 c^2, belting C, top shaft c^3, crank-disk d, pitman d^1, when arranged to operate as and for the purpose set forth.

136,133.—*Loom.*—AUGUSTUS CANIS and FREEMAN HIGGINS, Manchester, N. H.

The protector-rod extends across the loom, and carries at each end a finger, bearing against the shuttle-binder, and also a horizontal hook-arm, which operates the stop mechanism just before the lay completes its backward movement, in case a box opposite that from which a shuttle is about to be thrown is already occupied by a shuttle or the picking operation fails and the shuttle remains in the box. The weft-stop mechanism consists of two finger-arms, one on each side of the loom, pivoted to the front of the lay, and vibrating-forks, pivoted to the back of the lay, which are operated by a cam so as to feel for the weft-thread, pressing it, if present upon the grid and depressing the grid, by which means the finger is raised above a sliding catch in the breast-beam, which catch is connected with a rocker-shaft on the beam, and has a cranked end bearing against the shipper-lever. Each vibrating-fork is operated through an intermediate lever by a cam on the crank shaft. To prevent the action of the stop motion on the side of the loom, from which a shuttle has been picked, a short rocker-shaft is placed near each end of the lay, carrying at one end a finger operated by the shuttle-binder, and at the other end an arm, so arranged as to press up the finger of the grid above the sliding catch in the breast-beam. The friction driving-pulley is provided with a lubricating device, as set forth in the claim.

Claim.—1. The rocker-shaft n held in normal position by a suitable spring, and carrying at its opposite ends the arms o p, outward pressure of either of which by a shuttle-binder carries a hook, r, into position to actuate the lever u and knock off the shipper-lever x, the arrangement and operation being substantially as described.

2. The two pivoted finger-arms p^3 A^3, each located and pivoted as shown and described, and each having combined with it the lifting and falling prongs A^3 l^3, and there being in line with each a slide-catch, p^2, the arm, if down, striking the catch p^1, turning the shaft z^3, and knocking off the shipper-lever, and, if up, passing over such catch without moving it.

3. In combination with the arms p^3 A^3, arms or inclines m^3 n^3, which are thrown up to actuate the prongs A^3 l^3 when the lathe beats up, and which are thrown down before the lathe beats back, and arms p^3 and their inclines p^2, substantially as and for the purpose described.

4. The two independent rocker-shafts u^3 z^3, operated by the shuttle-binders, each having an arm, w^3 or x^3, operating to hold the finger arm p^3 or A^3 in position to pass over the catch p^2, when the shuttle has been thrown from a box on the same side with said shaft, and each releasing the finger-arm (so that it will strike the catch if not raised by the pressure of the yarn) when a shuttle is thrown into the adjacent box.

5. The clutch or friction-driving pulley y made with the socket d^2 and oil-hole e^2, a stationary pivot, f^2, extending into the socket, and said pivot, having an axial oil-passage, f^3, leading through it and into a vertical oil-passage, n^3, in the flange m^3 of the pin A^3, all substantially as shown and described.

136,134.—*Cartridge-Retractor for Revolving Fire-Arms.*—WILLIAM CLEWS, Ilion, N. Y.

Hooked-bar, sliding in the frame, operated by spring catch attached to the hammer, said catch being automatically released before the hammer reaches the half-cock, by riding over the incline or bevel on a projection of the hook-bar.

Claim.—1. The cartridge-shell retractor D, in combination with the hammer C, arranged, substantially as described, so as to automatically disengage itself from the hammer and return to position during the lifting of the hammer, for the purpose specified.

2. The automatic cartridge-shell retractor D, drawn back by the hammer and arranged, as herein described, so as to withdraw the cartridge-shell at or before the time the hammer reaches half-cock, and then be separated from the hammer, leaving the latter free in rising from half to full cock, substantially as herein specified.

3. The cartridge-shell retractor D, provided with the projection c having inclined surfaces g i, in combination with the spring coupling-pin or catch d in the hammer C, substantially as and for the purpose herein specified.

4. The combination of the cam-lever n and its pawl l with the cartridge-shell retractor D, so that the said retractor, while springing forward into position, moves the cylinder, substantially as and for the purpose herein specified.

5. The dog s, arranged substantially as described, or its equivalent, in combination with the hammer, and operating so that the turning movement of the cylinder is made or completed each time by the hammer just before it reaches full-cock, substantially as and for the purpose herein specified.

136,135.—*Washing Machine.*—THOMAS CLUCAS, Jr., St. Louis, Mo.

On a suitable frame a wash-box is hung on journals so that a swinging motion may be given to it; a weight is hung below as a counterpoise; the sides and bottom of the box are ribbed and the ends rounded. A close fitting door makes the box water tight.

Claim.—1. The receptacle A, when the same is provided with a flat bottom and vertical circular ends, in combination with the counterpoise B and frame C, as and for the purpose set forth.

2. The receptacle A, when the same is provided with a flat bottom and vertical circular end and ribs a a^1 a^2, in combination with the frame C and counterpoise B, as and for the purpose set forth.

136,136.—*Valve-Lubricator.*—JAMES COCHRANE, New York, N. Y.

Lubricating material is injected at intervals between the surface of the valve and valve-seat, the valve and valve-seat having channels and grooves for the purpose of spreading, retaining, and forming a passage for the lubricant.

Claim.—1. The combination of an injector or pump with the perforations a a, substantially as and for the purposes as herein-before set forth.

2. The combination of an injector or pump and perforations a a with the grooves or channels c c and the perforations b b terminating in a plug or stop-cock, substantially as and for the purposes as hereinbefore set forth.

3. The combination of an injector or pump and perforations, a a, and grooves or channels c c and perforations b b with the conduits J J, substantially as and for the purposes as hereinbefore set forth.

4. The combination of an injector or pump and perforations, a a, and grooves or channels c c and perforations b b and conduits J J with the cocks or safety-valves N N, substantially as and for the purposes as hereinbefore set forth.

136,137.—*Distilling Together Spirits of Turpentine and Alcoholic Liquids.*—WILLIAM CONFIELD, Chicago, Ill.

Claim.—The combination of grain or other similar substance in a fermenting state with spirits of turpentine, to form a chemical union, and then distilling the mixture by a continuous distillation to produce hydrated spirits of turpentine and camphene by one and the same process, as specified.

136,138.—*Hollow Auger.*—COLUMBUS W. CORE, Carlinville, Ill.

A series of separate disks, having cutting-blades formed therein, interchangeably used on the same shank.

Claim.—1. The combination of the body or chuck A with the cutter B, constructed substantially as described, for the purpose set forth.

2. The cutter B, formed in one solid piece, having the central opening d and cutting-blades, constructed and arranged substantially as described.

136,139.—*Blacksmith's Hammer.*—GARRET B. CUBBERLEY, Milwaukee, Wis.

The hammer and its operative parts can be moved in a line parallel with the anvil.

Claim.—1. Hammer B, pulleys C, shaft R, handle S, spring E, connecting-rods G G, straps D, and connection M, in combination with levers F and H, connecting-rod I, and frame A, substantially as described.

2. Rollers L and handle K, substantially as described, in combination with the above.

136,140.—*Bucket.*—JOHN V. DEUELL, Brooklyn, N. Y., assignor to himself, JOHN JENKINS, and PETER C. PROVOST, same place.

A piece of wood, thick enough to form the bottoms of two buckets, is turned to the desired form, and then divided diagonally, so as to form bottoms thicker upon one side than the other, so that a spigot placed upon the lower side shall completely drain the vessel.

Claim.—1. The within-described disk or closed wooden vessel A C D, adapted to be drawn from in an upright position, and having its bottom D inserted with an inclined upper face, so as to serve as and for the purposes herein set forth.

2. The hooped tapering vessel A, C, D, and E, with the upper face of the base D standing inclined to the axis, and provided with the bail H adapted to fold down within the chine, as and for the purposes herein specified.

136,141.—*Knob-Latch.*—JAMES M. A. DEW, Chicago, Ill.

The follower is provided with a long tubular bearing, which projects through a similar larger tube cast to the back plate of the lock. Through this first mentioned tube the knob-spindle passes, and to the outer extremity of the larger tube is attached the knob-rose.

Claim.—The combination and arrangement of the sleeve S, cast solid with the plate P, the hollow shank or follower support C and the escutcheon J, substantially as and for the purpose specified.

136,142.—*Magic Lantern.*—PHILIP DIEHL, Chicago, Ill.

A conical or cylindrical frame surrounding the lamp, and adapted to be rotated around it, carries a series of pictures or illustrations, so as, by a cord or otherwise, to have the views brought successively in front of the lens-tube for display. The instrument is designed for advertising purposes.

Claim.—The construction and arrangement, with relation to a magic lantern, of the revolving slide-frame F and cord G, substantially as and for the purpose set forth.

136,143.—*Die for Making Clips for King-Bolts.*—ARENDSE DILLENBECK, Fort Plain, N. Y.

A series of dies in a pair of blocks forge on the end of the bar the pillar and the pin. A blank containing these is then cut off on a line that shall give two horn-like projections to that end of the blank. The pillar is then clamped between other two blocks, and the two horns are then flattened and swaged in a recess in the surface of the blocks to form the plate.

Claim.—1. The dies A A with their several depressions, a, b, c, and d for producing the blank d^1, substantially as described.

2. The heading-dies B B, recessed, as described, for producing the head 4 on the pillar 3 from a forked blank, d^2, substantially as described.

136,144.—*Machine for Mixing and Kneading Dough.*—EDMUND EDWARDS, London, England.

A kneading-bar, which is the segment of a helix, an automatic locking device, and an adjustable crank or lever, all combined with the kneading-trough, mounted on standards by means of trunnions, one of which is hollow and receives through it the rotary driving-stem of the mixing-bar.

Claim.—1. The vessel or trough B mounted on standards A by means of trunnions a a, one of which is hollow and receives through it the rotary driving-stem g of the mixing and kneading bar D, in combination with the automatic locking device s s' for holding the vessel B either in an upright position or in an inclined or inverted position, substantially as described.

2. The mixing and kneading device consisting of arms D' D' and a bar, D, which is the segment of a helix, said arms D' D' being hung inside of the vessel B so as to rotate therein and operate as herein set forth.

3. The combination, with the removable stem g of the mixing and kneading device, of the adjustable crank or lever C, loop h, and set-screw i, substantially as described.

136,145.—*Device for Rolling Logs.*—TEMPLE EMERY, Peshtigo, Wis.

Jointed carriers are attached to the chains, which will allow the log to be rolled over them in one direction. They are then raised to a vertical position by springs and carry the log forward as they are moved by the chains.

Claim.—1. In a log-rolling and cant-sliding machine, the sliding, folding, and self-adjustable knees D D, one or more, in combination with a skidway, and arranged to engage and roll logs and slide cants arranged upon the skidway, substantially as specified.

2. In a log-rolling and cant-sliding machine, the sliding, folding, and self-adjustable knees D D, one or more, in combination with an endless chain, by means of which the said knees are actuated substantially as and for the purposes specified.

3. In combination in a log-rolling and cant-sliding machine, the beveled friction-wheel L, the sliding shaft M provided with the beveled friction-pinion m m and the clutch n and the pivoted lever N, substantially as and for the purposes specified.

136,146.—*Child's Table-Napkin Holder and Clasp.*—DAVID ESSEX, New York, N. Y.

A napkin is spread upon a table by strips of metal and a pivoted stretcher-bar, and held onto the table-leaf by two spring-clasps.

Claim.—The combination of the edge strips B B, pivoted stretcher-bars C C, and clasp D, for spreading and securing a napkin to the table, substantially as and for the purpose herein specified.

136,147.—*Revivifying Charcoal used in Rectifying Spirits.*—CHARLES LOUIS FLEISCHMANN, Washington, D. C.

Coal soaked with fusel-oil is charged with vinegar, and after the acidification of the fusel-oil has taken place the vinegar is forced from the coal by means of water.

Claim.—The process herein described for revivifying coal by treating it with diluted acetic acid with additions of mineral acids, for the purpose substantially as described.

136,148.—*Fruit-Jar.*—HENRY C. GASKILL, Mount Holly, N. J., assignor to HAY & CO., Philadelphia, Pa.

The outside shoulder of the neck of the jar and the shoulder of the cover which bears upon the gasket are ground in such a manner as to form a tight joint.

Claim.—The ground shoulder a of the fruit-jar, and the ground shoulder b' of the cover, in combination with the gum ring C, substantially as and for the purpose set forth.

136,149.—*Adjustably-Hinged Gate.*—EMANUEL M. GEORGE, Three Rivers, Mich.

Upper and lower pintles slide vertically upon slotted guide-bars. A bell-crank latch attached to the lower pintle secures the gate at different heights, as desired.

Claim.—1. A hinge provided with a bell-crank latch, E, substantially as and for the purposes set forth.

2. In combination with the bell-crank latch E and pintle C', the slotted guide-bar B', for the purposes set forth.

3. The combination of the guide-bars B B', pintles C C', hinges D D', bell-crank latch E, and cord F, when the parts are constructed and arranged to operate substantially as set forth.

136,150.—*Apparatus for Cooling and Transporting Milk.*—EDWARD D. GIRD, Syracuse, N. Y.

A wooden casing is constructed upon an ordinary platform-car with doors in its top, and has arranged, longitudinally, within it a cylindrical milk-tank, with an ice-box encircling its upper half. A short pipe is attached to the top of the tank, through which milk is introduced into the same, and in which is arranged a follower, which moves down by its own weight so as to rest continually upon the surface of the milk as it contracts.

Claim.—1. The combination of the tank A and the ice-box P, constructed substantially as described, and for the purpose specified.

2. The milk-tank A, ice-box P, and casing D, in combination with a suitable platform-car, the whole constructed and arranged substantially as specified.

136,151.—*Buckle-Fastening.*—FRANK H. GLADDING, Providence, R. I.

The fastening is composed of two circular plates. One plate is concave, and is cut at different points from its circumference toward its center, forming a spring. A stud and slotted cross-bar are secured to this plate, and the cross-bar has on its under side two rigid projections, which look in corresponding holes in the upper plate. The upper plate is slotted to receive the cross-bar, and has a knob near the end of the slot.

Claim.—The spring-plate B, in connection with the stud or cross-bar C, and in combination with plate A, when constructed to operate as herein described, and for the purpose specified.

136,152.—*Joiner's Clamp.*—WILLIAM H. GOODCHILD, Bayonne, N. J., and SAMUEL F. HAY, of Brooklyn, N. Y., assignors to WILLIAM H. GOODCHILD, of Bayonne, N. J.

The arms with adjustable shoes are connected to the clamp-plates by pivot-joints to admit of proper bearings upon the work to be clamped.

Claim.—1. The within-described compound clamp, having adjustable and self-adjusting arms I I, with swiveling bearing surfaces or shoes J J adapted to act on each side of a joint or mortise, in combination with compressing means C, when the arms and their connections are capable of rocking to allow for inequalities or rake in the material acted upon, substantially as and for the purpose described.

2. The spring s, arranged as shown, and serving, in combination with the arms I I and suitable engaging notches or stops, to allow of adjustment of the arms, as herein specified.

136,153.—*Die-Stock for Cutting Screws.*—JOHN J. GRANT, Greenfield, Mass.

The die-stock is a plate with two handles and a circular opening cut from the center. One side of the plate is cut through or slotted from the opening to the outside, allowing the stock to be sprung for the reception of the ring carrying the dies. The stock is caused to close on the ring and hold it securely, by a screw in the stock, at right angles to the slot, which draws its sides together.

Claim.—1. The elastic die-stock or plate, with a cylindrical receptacle or socket divided by a vertical aperture and provided with a set-screw, as and for the purposes described.

2. The combination of the die-stock, constructed as described, and the collet, constructed as described.

136,154.—*Labeling-Machine.*—CHARLES W. GREENE, Jackson, Tenn.

The package rests upon a spring-seated bed, and one from a strip of printed addresses, coated with paste from a roll, is pressed down thereon by a presser-foot, and torn off against its cutting-edge.

Claim.—1. A presser-foot, actuated by foot or hand, for pressing upon an address-label with so much force as is necessary to secure its adhesion, which presser-foot is provided with a cutting-edge by which the address is cut or torn from the strips or sheets prepared for the purpose.

2. In combination with the above presser-foot, a platen which shall be so adjustable as to secure a uniform pressure upon the label or address, though the packages to which they are applied may vary in thickness.

3. The labeling-machine, consisting of the presser-foot A with cutting-edge a, spring S, pedal-lever L, yielding platen P, and paste-roller R, all substantially as and for the purposes herein set forth.

136,155.—*Pad for Harness.*—JOHN D. GROFF and KENNARD H. WILSON, Oxford, Pa.

The pad is made of rubber and hollow on one side, and with pockets on the other. The action of the saddle on the horse forces air through orifices in the hollow side through channels in the pockets on the other side.

Claim.—An elastic pneumatic pad, when combined of a hollow chamber, A, and pocket C, and stuffed with chamois leather D, substantially as and for the purpose specified.

136,156.—*Trammel for Lifting-Jacks.*—ELIAS H. HAKE, Canfield, Ohio.

Claim.—A trammel for lifting-jacks having a main bar or upright, A, hooks B B', and a cross-bar, C, arranged and constructed substantially as and for the purpose described and set forth.

136,157.—*Hand Corn-Husker.*—HENRY L. HALL, Woodbridge, Iowa.

Thumb and forefinger of both the right and left hand glove or cot have each a claw to facilitate the operation of husking corn.

Claim.—The left-hand glove or cot having the claw F upon the forefinger and the claw G upon the thumb, when employed in combination with the right-hand glove or cot likewise provided with claws, substantially as described, for the purpose set forth.

136,158.—*Bed-Bottom.*—PULASKI C. HARD, Wadsworth, Ohio.

An inverted conical spring has the termination of the wire turned immediately under the center of the coil, and then downward, and is then bent upward and one side barbed. This is forced into a hole in the slat of the bed-bottom. A number are so arranged on slats, and the upper ends of the springs held in position by links.

Claim.—1. The barbed dowel or loop D, substantially as and for the purpose hereinbefore set forth.

2. The combination of the barbed dowel or loop D with the spring C, the slats A and B, and the link L, substantially as and for the purpose specified.

136,159.—*Gun-Sight.*—MUNSON W. HARRINGTON, Homestead, Iowa.

Gives an adjustable and convertible coarse and fine sight.

Claim.—1. The combination of the slotted standard A and slides B and C, as described.

2. The combination of the parts herein described, whereby an adjustable and convertible coarse and fine sight is produced, substantially as specified.

136,160.—*Composition for Artificial Stone.*—WILLIAM HEDLEY, Medina, N. Y.

The composition is composed of sand, sixty-four parts; Portland cement, thirty-five parts; litharge, one-half of one part; alum, one-fourth of one part; and sulphate of iron, one-fourth of one part.

Claim.—The composition for artificial stone, consisting of the parts and in the proportions specified, prepared by the process substantially as described, for the purposes specified.

136,161.—*Hatchway-Guard.*—MATHIAS J. HINDEN, Detroit, Mich., assignor to CORYDEN B. PALMER, same place.

The semicircular arms are acted upon by the rollers on the rising-and-falling frame, so as to elevate the guard while the hatch fills the opening. At other times the guard forms a railing around the hatchway to prevent accidents.

Claim.—A hatchway guard or gate, whose ends terminate in segments E of a true circle, and which is pivoted to the rails D, and which is operated by wheels H suitably journaled on the elevator, substantially as set forth.

136,162.—*Ruffler for Sewing-Machines.*—JAMES S. HUGO, Camden, N. J., and JAMES T. STEWART, Philadelphia, Pa., assignors to JAMES T. STEWART, Philadelphia, Pa.

The ruffling-finger is secured to one of the arms of the pivoted carrier. At the outer ends of these carriers are inclined bars adjustable with relation to each other, and between them the nut on the needle-bar works and operates the ruffling finger.

Claim.—1. The horizontal pivoted ruffler-carrier H H', composed of two arms having a common pivot, *f*, and terminating in parallel oblique bars J J to form a cam to engage with a driving projection on the needle-bar, as set forth.

2. The pivoted arms H H' carrying the oblique or diagonally-arranged bars J J, and adjustable, as described, to regulate the movement of the ruffling-finger.

3. A ruffling attachment composed of a fixed presser-foot, A B D, constituting also the frame and separator, an elastic holder, F, a ruffling-finger, G, a pivoted ruffler-carrier, H H', and adjustable parallel cam-bars J J, constructed, arranged, and operating substantially as herein specified.

136,163.—*Anti-Friction Metal.*—GEORGE S. HUNT, Sacramento, Cal.

Lead, five pounds; antimony, one pound; and plumbago, one ounce.

Claim.—An anti-friction metal compounded of the materials above mentioned, in the proportions specified.

136,164.—*Rotary Steam-Engine.*—CHARLES INMAN, Hope, Mich.

A rock-shaft is arranged in suitable bearings on the side of the engine, and is provided with three projecting arms, the middle one of which works in a cam-groove and operates the cut-offs. The sliding abutments or pistons receive a reciprocating motion by means of a cam-groove in the sides of the case, and are provided with friction-rollers.

Claim.—1. The rock-shaft *b*, provided with arms *a c e*, in combination with the cam-groove U, face-plate Q', cut offs X, steam-pipes F G H J I, and disk V, constructed and arranged as and for the purpose set forth.

2. The combination of the cut-offs *n n*, slides P provided with rollers T, cam-grooves B, braces *t* N, cut-offs *r t*, rim A, plates Q Q', and disk V, constructed and arranged to operate as set forth.

136,165.—*Article of Food.*—LEVI S. JOHNSON and MARVIN G. JOHNSON, Cortland, N. Y.

Raw lean beef is cut very fine, mixed with salt, saltpeter, and sugar, and packed tightly in narrow bags of cotton. The bag of compound is then subjected to the usual smoking process, and the article used as a substitute for dried beef.

Claim.—A beef compound, prepared substantially as and for the purpose above set forth, as an article of manufacture.

136,166.—*Safety-Stud, &c.*—ALEXANDER KENT, Baltimore, Md., assignor of one-half his right to JOHN FRIEDRICH, same place.

Two arms are hinged on separate pivots to the shank of a button or its equivalent, and are locked to the clothing by a movable piston and spiral spring operating inside of the shank. By withdrawing the piston the arms are closed and the button is easily detached.

Claim.—1. The combination of the spiral spring K and the movable piston H G with the arms D D hinged on separate pivots, substantially as and for the purpose hereinbefore set forth.

2. The arms D D when hinged on separate pivots in the single hollow stem or shank E, substantially as and for the purpose hereinbefore set forth.

136,167.—*Folding-Table, &c.*—THOMAS P. I. MAGOUN, Worcester, Mass.

The top piece is hinged to two pairs of legs, each pair of legs crossing each other and pivoted at their junction. One leg in each pair is jointed at about half the distance between where it is hinged to the table top and where it crosses the other leg.

Claim.—The combination, with the top piece C, of the bars A B *b*, hinges or pivot-joints D E F, and knuckle-joint G, all constructed and arranged for operation in relation to each other, substantially as shown and described, and for the purpose set forth.

136,168.—*Metallic Cartridge.*—ISAAC M. MILBANK, Greenfield Hill, Conn.

A flanged tube having overlapping edges made by rolling sheet-metal around a mandrel, and a cup-head secured therein by solder, which runs and simultaneously secures the edges of the metal near the base.

Claim.—The cartridge-case made of a sheet of metal rolled into a cylindrical form, with a flange projecting outwardly around its rear end, combined with a base inserted within said case, and secured permanently with solder or other material that simultaneously unites the lapping edges of the case at the rear end, as set forth.

136,169.—*Revolving Harrow.*—HENRY MITTENDORF, Stony Hill, Mo.

A rotary harrow constructed and pivoted to a cross-bar; the cross-bar is in turn connected to an arched bar, and the arched bar to a bar fastened on the front of the axle, with an arm passing up through a standard, which has a series of holes for adjustment. It is further provided with an adjustable arm fastened to the tongue. At the lower end of the arm is secured a wheel, on which the rim of the harrow revolves.

Claim.—The combination of a revolving harrow, E, rim e^3, swivel A^1, chain and standard A, guide-wheel H, adjusting-bar F, foot and hand levers f f^1 f^2 f^3, all said parts being constructed and arranged to operate as and for the purpose set forth.

136,170.—*Smoothing-Iron.*—LOUIS L. MIVELAR, Louisville, Ky.

A smoothing-iron of the ordinary form has a narrow flange and groove at its base and a flange projecting at the point in front of the iron. At the center of the iron, curved projecting arms are placed, to which a detachable handle is held by pivots and slots.

Claim.—1. The flange B, terminating in the point D, in combination with the groove *c* and body A of the iron, when arranged, constructed, and operated substantially as and for the purpose set forth.

2. The combination of the stationary and loose handles E and F, as above described, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

136,171.—*Machine for Grinding Harvester-Knives.*—JOHN MURPHY, New York, N. Y.

Claim.—The bar C with groove *c*, spiral spring *b*, adjustable collar D with set-screw *d*, collar E with set-screw *f*, segment F, bars G G, slot *i*, pin *j*, segment H, recess K, and guides I, in combination with the emery or grindstone-disk J, frame A, table B, friction-wheel L, driving-wheel M, crank N, and treadle O, substantially as and for the purpose hereinbefore set forth.

136,172.—*Punching-Machine.*—SAMUEL W. MURRAY, Milton, Pa., assignor to MURRAY, DOUGALL & CO., same place.

The tool-spindle is furnished with an elongated slot, in which is hung, on a wrist-pin, a wedge-shaped cam. The slot has on one side of its lower end a ledge or shoulder, notched to receive the point of the cam, and so arranged that when the cam is thrown on one side by a weighted arm it will engage with the ledge and cause the spindle to reciprocate, and when on the other it will disengage from said ledge and work in the elongated portion of the slot, the spindle being retained at its highest point by a weighted lever.

Claim.—1. The combination, with the vertically or horizontally reciprocating tool-spindle C provided with the opening I and ledge K, of the horizontal power-shaft D with an eccentric prolongation, F, and wedge-shaped cam G, when all the parts are constructed and operating as herein shown and described.

2. The weighted lever I', pivoted to the wedge G and adapted to be turned in reverse directions, for the purpose specified.

136,173.—*Feed Mechanism for Cotton-Openers, &c.*—WILLIAM NOTON, Oldham, England, assignor to RICHARD KITSON, Lowell, Mass.

For the purpose of moving a weighted lever and shifting a strap on cone-pulleys to vary the speed of the feed-roll if an inequality exists in the thickness of any portion of the fleece passing between the feed-roll and the flexible plate or blocks.

Claim.—1. The series of blocks *f* and saddles f^1 f^2 f^3 f^4, &c., for regulating the speed of the feed-roller to the average thickness of the fleece passing beneath it, substantially as described.

2. The flexible flat plate *c* or blocks *f*, in combination with the feed-roller, substantially as described.

3. The fixed bar d^1 over which the fibers are struck by the beater, in combination with the automatically-adjustable holder which presses the fleece to the feed-roller, substantially as described.

4. The combination of the fixed bar d^1, feed-roller *b*, weighted blocks *f f*, and saddles f^1 f^2 f^3 f^4, &c., substantially as described.

136,174.—*Broadcast-Seeder.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

A grain-sack, to be slung over the shoulder, is provided with a straight discharge-tube, and provided with a valve to govern the quantity of seed.

Claim.—1. The herein-described method of uniting the tube A and sack B by means of the ring L in a broadcast seed-sower, in the manner substantially specified.

2. In combination with the elements of the first claim, the delivery-tube A when provided with a regulating-valve, F, near its outer termination.

136,175.—*Re-winnowing Attachment for Thrashers.*—JOHN B. PADON, Troy, Ill.

Attached to rear of thrashing-machine, so that the straw may be delivered thereon by straw-carrier and re-winnowed.

Claim.—The frame A, perforated bed B, plates *a* and *w*, belts A A' having bars *b b'*, &c., fan D, worm E, and operating-pulleys, the several parts being combined, constructed, and arranged for joint operation, substantially as shown and specified.

136,176.—*Car-Coupling.*—THOMAS N. PENGELLY, Detroit, Mich.

The notch on the link is kept on the under side by a weight, and the link is held in the draw-bar by a catch, which bears against the piston. Rubber packing between a shoulder on the draw-bar and the end of the piston gives the desired elasticity to the coupling.

Claim.—The construction and arrangement of the hollow draft iron C C, hollow piston D provided with lugs *a c*, the cushion *d*, the cranked shaft E, the cam-latch F, and the harpoon G, provided with the notches *f f* and weight *g*, as and for the purpose set forth.

136,177.—*Bridge.*—HENRY PATTIT, Philadelphia, Pa., assignor of one-half his right to JOSEPH M. WILSON, same place.

The beveled block is designed to distribute the strain, under heavy rolling loads, over all the links of the chord, notwithstanding the deflection of the girder.

Claim.—The combination of the flanged cross-girder B and the beveled block C, substantially as shown and described.

136,178.—*Billiard-Table Cushion.*—GEORGE E. PHELAN, New York, N. Y.

Claim.—1. The U or V shaped metallic spring or cushion C for billiard tables, formed in one piece and applied directly to the bed of the cushion, in the manner and for the purpose herein set forth.

2. The combination of the metallic spring or cushion C, formed in one piece, with the India-rubber spring or bed surrounding the same, also formed in one piece, both being of U or V shape, and applied directly to the billiard-table, in the manner and for the purpose herein set forth.

136,179.—*Plow-Wheel.*—MORTON POTTLE, Mendon, Mich.

The wheel is held in position by a divided box inclosing a grooved axle or stud. Dirt is thus prevented from coming in contact with the bearing surfaces.

Claim.—The combination of the grooved axle, the independent boxes, and the hub with the plate D and standard E, as described, for the purpose set forth.

136,180.—*Woven-Wire Mattress-Frame.*—DAVID J. POWERS, Chicago, Ill.

The end pieces are pivoted to the side pieces, and the straining-bolts, attached to the end piece and screwing into brackets upon the side pieces, regulate the tension of the fabric.

Claim.—The straining-bolts *d d*, in combination with a yielding end piece, B, constructed and operating substantially as and for the purposes specified.

136,181.—*Swing.*—J. FREEMAN QUIGG, Chicago, Ill.

Claim.—1. A swing provided with the tray D, arranged substantially as described, and for the purposes specified.

2. A parlor-swing provided with the vertically adjustable tray D and with the hinged back E rendered adjustable in inclination by means of the pivoted, bent, and notched arms *e e*, pin *f'*, and latch *g*, all substantially as specified.

136,182.—*Lath-Machine.*—SILAS B. RITTENHOUSE, Larwill, Ind.

Cutters having beveled edges are placed upon the saw-arbor and upon an additional arbor placed below it, thus cutting a dovetailed groove in the edges of the laths.

Claim.—In lath-sawing machines, the combination of the saws E with the saws F L and arbors B C, substantially as and for the purposes set forth.

136,183.—*Latch for Gates and other purposes.*—CLARK ROBERTS, Winchester, Ill.

A gravitating segmental latch is furnished with a small opening near its central portion, and with a projecting arm beneath it, which arm hooks under a guide-bar raised upon the lower edge of the base-plate, to which the latch is secured. An operating angular lever is pivoted to the gate-post above the latch, and its depending arm works in the opening midway of the latch.

Claim.—The combination of the gravitating-latch and the thumb-piece, the former being constructed with an aperture, *b*, and arm B' underneath it, and one arm of the latter passing through said aperture to operate upon arm B', substantially as specified.

136,184.—*Adjustable Nut.*—JAMES RUSSELL, Springfield, Mass.

Claim.—1. A nut divided in two parts, each part operating in connection with the other upon a threaded shaft, one part being capable of being adjusted against one side of the thread upon the shaft, and the other part against the other side of the thread, substantially as and for the purpose described.

2. The nut *a*, divided longitudinally, and each part provided with the lip *a'*, against one of which are turned the screws *k*, operating through threaded holes in the plates D' to adjust the parts of the nut to the threaded shaft, in the manner substantially herein specified.

136,185.—*Compound for Destroying Insects, Vermin, &c.*—EDWIN B. SEARS, San Francisco, Cal.

Alcohol, wormword, gum camphor, Scotch snuff.

Claim.—The ingredients above enumerated, mixed and compounded in the manner and in about the proportions specified, substantially as and for the purposes herein described.

136,186.—*Inkstand-Filler.*—MILAN C. STEBBINS, Springfield, Mass.

In the stopper is inserted a flexible tube provided with a mouth-piece, through which the air in the jar is compressed, forcing the contents of the bottle through a bent tube into a reservoir attached to the outer arm of a discharge-tube and against a plug, the air in the tube being forced along by the liquid and caused to pass by the plug through the grooves therein, the liquid descending, and drawn off, as required, by a suitable valve.

Claim.—An inkstand-filler, consisting of the jar A, tubes C and D, the tube G having the check-valve *d* therein or its equivalent, and the nozzle I with its stop-cock *e*, all substantially as set forth.

136,187.—*Dredger.*—THOMAS SYMONDS, Portland, Me.

The buckets are hinged to the variable arms at their upper outer corners, and are attached to the rising and falling shaft at their upper inner corners, the shaft being operated by two chains, one of which is attached to the lower end of the stock. The buckets are opened by the bifurcated chain as they are lowered. The form of the buckets and the mode of obtaining leverage employed gives them a cutting instead of a scraping function.

Claim.—1. A dredger composed of two buckets, C C, which, when closed, formed more than a half cylinder, the said buckets being hung on variable arms B B and operated at the top center by a traveling rotating shaft, which unites the said buckets at that point, and has its bearings in them at their point of connection, as herein set forth.

2. The brace-plate A, in combination with the variable arms B, as herein set forth.

3. The combination of the stock *a*, the moving or variable arms B, and the buckets C, as herein set forth.

136,188.—*Knife-Polisher.*—FRANCIS W. TABBLE, Charlestown, and HORACE W. SAWYER, Chelsea, Mass.

The elastic rollers are held in position by the thumb-nuts, and when the nuts are loosened the rollers can be turned so as to present a new surface to the knife-blade. A spring allows the rollers to separate at the top and adjust themselves to the varying thickness of the blade.

Claim.—The elastic adjustable cylinders B B', coated with emery and attached to base-plate A by means of screw-bolts E E' connected together by spring S, said cylinders being adjusted by thumb-screws C C' bearing upon collars H H', when constructed and arranged substantially as and for the purpose set forth.

136,189.—*Revolving Rake-Shoe.*—ALMERIN J. TAYLOR, Rome, Pa.

Claim.—The rake-shoe herein described, composed of sections A B secured together detachably, as set forth, for the purpose specified.

136,190.—*Watch-Chain Catch.*—LOUIS C. THIERY, Newark, N. J.

A hollow wire ring hinged on one side is provided with a spring-snap taking into and fastening the other two ends.

Claim.—A hollow wire with a catch or snap for necklaces and chains, constructed, arranged, and operating as set forth.

136,191.—*Insulator for Battery-Cups.*—JAMES H. THOMAS, Baltimore, Md., assignor of one-half his right to A. G. TOMAY, same place.

The insulating-stand for holding battery-cups is provided with a removable receptacle for collecting and retaining any leakage that may occur of the liquids employed in the battery.

Claim.—As a new and improved article of manufacture, the insulated battery-cup holder, consisting of the concave part A provided with lugs and with the perforations *c*, the base E having the chamber D, for the cup F, and the shank G, all constructed as shown and described.

136,192.—*Automatic Manger.*—DANIEL A. TOWNSEND, Unionville, S. C.

An automatic manger upon a vertical shaft actuated by a spiral spring. The manger is turned back half round, filled with feed, and fastened to a catch upon a horizontal shaft, to be tripped at the desired hour by means of an alarm-clock.

Claim.—1. The combination of compartment-troughs and vertical shafts with actuating-springs, operating substantially as described.

2. The compartment-troughs with their shafts, actuating-springs, and chains or cords, in combination with the horizontal shaft and releasing mechanism, substantially as specified.

3. In an automatic manger, a horizontal roller adapted to be released by means of an alarm-clock, in combination with a spring-

actuated revolving trough arranged to be connected with said roller, all operating substantially as described.

136,193.—*Machine for Making Extension-Table Tops.*—ROBERT G. UTLEY, Boston, Mass., assignor to CHARLES H. PIERCE, CHARLES H. GILMAN, and GEORGE W. TUTTLE.

The boards for the table-top are placed between the parts A and A', which serve as gages, having the dowel-pins inserted into them. They are then sized and molded, thus forming all according to the same gage without the necessity of numbering them.

Claim.—The combination of the forms A and A' having pins *b b b* and holes *c c c* with guides *d d*, when operated in the manner and for the purpose specified.

136,194.—*Corn-Husking Implement.*—OLIVER J. WARREN, Des Moines, Iowa.

A husking-pin with a concave spoon-shaped jaw is used in connection with a thumb-stall having a corresponding convex jaw with a tooth at the point.

Claim.—A corn-husker, composed of the parts A, B, C, and *a*, substantially as described.

136,195.—*Curtain-Fixture.*—WILLIAM A. WHEELDON, Chicago, Ill., assignor of one-half his right to DIXON BEAN, same place.

The roller is attached to frames that slide up and down on guide-wires. The upper ends of said guide-wires are rigidly attached to the pulley-blocks at the top of the window-frame. Their lower ends are attached to levers for the purpose of straining said wires.

Claim.—The metal plates O, having the recesses P and the straining-levers G G, in combination with the guide-wires F attached at their upper ends to the pulleys or pulley-casings at the upper corners of the window frame, all constructed substantially as and for the purpose specified.

136,196.—*Barrel.*—HENDERSON WILLARD, Grand Rapids, Mich.

Formed of sections bent into cylinders and held together by cross-battens of wood, the joints being covered by cloth.

Claim.—A wooden cylinder for barrel or similar package, constructed of sections A B C, two or more, battened with cloth or other either flexible material *b b*, substantially as described.

136,197.—*Apparatus for Tempering Umbrella-Rib, Steel Strips, &c.*—ARTHUR WILSON, Birmingham, England, assignor to JAMES CONAWAY and JOHN LOCKEN, Philadelphia, Pa.

The steel strips, previously oiled, are placed in the rings together with heated wires. The rings, wires, &c., are placed beneath the griddle, to which a reciprocating motion is imparted, whereby the strips are tempered and straightened.

Claim.—1. The process of tempering and straightening steel strips, in the manner and for the purposes substantially as described.

2. The combination of the slab or table A, the rings B B, the wires C C, the griddle D, and the handle E, or their equivalents, arranged, constructed, and operating in the manner and for the purpose substantially as described.

136,198.—*Journal-Box.*—SAMUEL ALAND, Rome, N. Y.

A flange or collar on a tubular shaft-bearing, with a reservoir and outlet for the waste oil.

Claim.—1. The improved journal-box A provided with slots D, and the ball B cast or constructed in one piece and forming the chamber C between them, as shown and described.

2. The shaft having the enlarged collar N provided with the groove O, in combination with the socket L formed in the end of the journal-box A, as shown and described.

136,199.—*Water-Closet.*—JAMES ALBEE, Chelsea, Mass.

A hollow annulus is formed with a groove in its under side to rest upon the edge of the pan, and provided on its outer periphery with an educt to lead into a pipe or flue for the discharge of the vitiated air, and on its inner periphery provided with a series of holes to carry off any gases from deposits in the pan.

Claim.—The annular ventilator, substantially as described, and also as combined and arranged with the water-closet pan, or with such and the seat, essentially as specified.

136,200.—*Game-Board.*—JAMES C. ARMS, Northampton, Mass.

The usual leather-covered sides are finished separately and slide into place in the grooved frame.

Claim.—The folding game-board having its frames provided with grooves *b* into which the faces *c* are inserted, substantially as and for the purposes set forth.

136,201.—*Machine for Planing Clapboards.*—JAMES ATKINS, Augusta, Me.

Spur-rolls for feeding the boards are placed under the table to keep the thick edge of the board close to the guide to be dressed by the edging-cutter. The top surface is dressed by the horizontal cutter.

Claim.—In machines having rolls for feeding the clapboards, the spur-roll A, made adjustable to different inclinations so as to crowd the clapboard against the edging-cutters, substantially in the manner described.

136,202.—*Steam-Pressure Regulator.*—ANDREW J. BALLARD, Cohoes, N. Y., assignor to UNION WATER-METER COMPANY, Worcester, Mass.

A shipper-rod and actuating-lever are combined with an adjustable weighted lever of a pressure-regulator, and connected with a bell-crank having a curved arm and arranged on the stem of a valve in the steam-pipe, and attached to the weighted lever by a slotted rod and spring; the whole to automatically and uniformly regulate the pressure.

Claim.—1. The combination, substantially as described, of the slotted rod *i* and spring *x* with the levers *b* and *f*, for the purposes described.

2. The lever *p*, connecting-rod *o*, lever *r*, and arm *t*, in combination with lever *b* of valve *a*, as and for the purpose set forth.

3. The combination of the shipper-rod *o* and its actuating lever with the adjustable pressure lever *f* and valve-lever *b* of an automatic pressure regulator, the whole operating in the manner and by means of devices substantially as described, for the purpose set forth.

136,203.—*Compound for Expelling Flies from Rooms.*—JULES BAQUOL, Baltimore, Md.

Powdered laurel leaves and glycerine, or a decoction of laurel leaves, lime, and water.

Claim.—1. The compound of powdered laurel leaves and glycerine, herein described.

2. The compound of decoction of laurel leaves and lime, herein set forth.

136,204.—*Machine for Planing Stereotype-Plates.*—HENRY BARTH, Cincinnati, Ohio.

A broad shaving-cutter reciprocated over a horizontal table by racks, one at each end, operated by pinions on a winch-shaft; a plain section of table for the stereotype-plate to lie on, and a broad wedge operated by a screw to adjust said section as to height; and a stationary section of table for the plate to abut against.

Claim.—In combination with the frame B, the movable table T, quoin W, screw S, and cutter-head C, when arranged and acting substantially as above set forth, for the purpose specified.

136,205.—*Gig-Saddle Trees.*—JOHN BAUER, Newark, N. J., assignor to CHAS. M. THEBERATH and JACOB H. THEBERATH, same place.

The metallic stiffening extends entirely around the saddle and is secured to the tree by pins at an oblique angle.

Claim.—The one-piece plate C provided with rigidly-attached pins *a* placed at an oblique angle to the faces thereof and applicable to skirt B and plate A, in the manner and for the purpose described.

136,206.—*Apple Parer, Corer, &c.*—GEORGE W. BENNETT, Smithville, Ind.

A flanged guide-rail is attached to a table. On this rail slides a carriage, from which an arm extends forward and downward, its outer end grasping a bar running parallel with and connected to the guide-rail. On said carriage is pivoted a semicircular cog-wheel, provided with a lever for turning the same; this segment of a cog-wheel is connected by gearing with the pinion on the shaft of the fork for holding the apple. The corer and cutter is attached to the rail at the end opposite the fork. A catch on the guide-rail holds the carriage in position while the apple is being pared; then, by slightly raising the lever, the carriage slides forward and the apple is brought against the coring and cutting device.

Claim.—1. The combination of the segment cog-wheel E with lever G, paring-knife shaft J, spring E, and carriage B, with the notch *z*, substantially as and for the purposes herein set forth.

2. The combination of the segment cog-wheel E with lever G, gear-wheels a H *b*, and fork I, all as herein set forth.

3. The sliding carriage B, carrying the fork I and moving upon the rail A to and from the corer K, in combination with the arm C and bar D, for the purposes herein set forth.

4. The catch *y* formed on the rail A to hold the sliding carriage B, for the purposes herein set forth.

136,207.—*Scroll-Saw.*—HENRY BICKFORD, Cincinnati, Ohio, assignor to LEWIS FAGIN, trustee for MARY M. and CARRIE M. FAGIN.

The saw is strained by two rubber springs arranged at its extremities in such a manner that movement of the saw in either direction compresses one of the springs.

Claim.—1. The combination of way B, saw C, rolling arm D, link E, spring F, and connecting-bolt G, constructed and operating substantially as and for the purpose stated.

2. The pivoted way B *b b'*, in combination with the adjustable bolt b^3, operating substantially as and for the purpose specified.

3. The combination of saw C, belt or strap L, segmental pulley K *k*, cam M, and spring O, the parts being connected, and the whole operating substantially as and for the purpose specified.

4. The elements enumerated in the last preceding claim, in combination with the arm *g* having elongated recesses *c* for the bearings of the axis of the cam M, substantially as and for the purpose specified.

136,208.—*Apparatus for Rendering Lard, Treating Offal, &c.*—JOSEPH N. B. BOND, New York, N. Y.

The gas from the rendering-tank is, together with steam, conducted through a decomposing-retort filled with iron filings and placed in the fire-box under a boiler; from thence the gas passes to a condenser and washer, and finally to the fire-box, where it is consumed. A steam-jet is admitted into the pipe between the decomposing-chamber and condenser to act as an exhaust.

Claim.—1. The combination of a decomposing-chamber, A, and condensers E, with a gas-conductor, C, pipe D, and steam-generator, K, substantially as and for the purpose shown and described.

2. The process for deodorizing gas from rendering-tanks, viz., passing the gas, in connection with steam, through a highly-heated chamber containing iron filings or their equivalent, substantially as described.

136,209.—*Pruning-Shears.*—THOMAS BORDEN, Squancum, N. J., assignor to himself, DAVID P. KISNER, and THOMAS HULETT, same place.

Each lever of the ordinary pruning-shears is furnished with two cutting-blades. The levers are so pivoted that the two inner blades cut upon each other, and each one also upon an outer blade. Thus from the four blades three pairs of cutting-edges are formed, and these edges can have varying forms to suit the different uses to which the implement is to be put.

Claim.—As an article of manufacture, a pair of pruning-shears, consisting of the levers A A C provided with two double-edged blades in the middle that work against each other and respectively against a single-edged blade on each outside, as described.

136,210.—*Burglar-Alarm.*—HENRY L. BROWER, New York, N. Y.

The alarm-bell and operating mechanism are placed within the base of a portable case or figure, and are held in check when wound up by a detent arm or pin projecting downward so as to press upon the table or other surface on which the instrument stands. When the article is lifted, or a knob touched, the detent is released and the alarm rings.

Claim.—1. The detent D', spring E, inclined planes F F, arm G, spindle H, and knob K, combined and arranged with respect to the alarm mechanism in the case A, to operate substantially as and for the purpose described.

2. The combination, with spring E, of the spring L, lever M, and pin N, as and for the purpose described.

136,211.—*Tenoning-Machine.*—MARTIN BUCK, Lebanon, N. H.

The rotary cutters are made adjustable to and from each other, or they can be moved coincidently by a right-and-left screw-shaft operated by a jam-nut, having a set-screw with a threaded follower to prevent injury to the threads of the screw-shaft.

Claim.—1. The combination and arrangement, with the cutters F G and frames L M, of a right and left hand screw, gears N and O, constructed and operating for adjustment of the cutters to or from each other, substantially in the manner described and specified.

2. The gear-wheel O and lock-nut N, combined with the screw P, set-screw *e*, and follower *f*, whereby rotary and reciprocating motion can be imparted to the screw, constructed and operating substantially in the manner described and specified.

3. In combination with mechanism described in second claim for adjusting the cutters F G vertically, the mechanism for adjusting the cutters laterally, consisting of the sliding boxes *j k*, and screws *j k*, constructed and operating substantially in the manner described and specified.

4. The combination, with the mortising-cutter J, of the screw *x*, gear-wheels *g h*, and shaft *i* for adjusting the cutter J vertically, substantially as described and specified.

136,212.—*Hoisting Apparatus.*—CHARLES CLARK, Unadilla Forks, N. Y.

Claim.—1. In a hoisting or elevating apparatus having a movable car or carriage, an automatically-operating hook, or its equivalent, for keeping the load suspended, substantially as and for the purposes herein set forth.

2. The combination of the pivoted hook G, rod or frame H, and spring *b*, arranged as described, and for the purposes herein set forth.

3. The combination of the movable car A, latch D, plate E, pulley J, loop *h*, and hook G, all constructed and arranged to operate substantially as and for the purposes herein set forth.

136,213.—*Preventing Corrosion of Stay-Bolts in Steam-Boilers.*—JOHN COCHRANE, New York, N. Y.

The object is to form a non-corrodible crust on the bolt after the crust is destroyed in cutting screw-threads. This is accomplished by inclosing the bolts in an iron box with animal charcoal and heating for five hours. Other means of case hardening may be employed.

Claim.—A stay-bolt rendered impervious to the action of the acids and salts usually present in the water of steam-boilers, in the manner and for the purpose substantially as described.

136,214.—*Steam Boiler.*—EDWARD R. COLE, Pawtucket, R. I.

Prevents weakening of the smoke-flue by excessive heat and consequent collapse under steam-pressure. Intended especially for fire-engines.

Claim.—The combination, with the main flue or up-take in a steam-boiler, of a strengthening and protecting inclosed chamber or water-jacket surrounding the flue, located within the steam-space, and provided with communicating pipes, arranged substantially as described, whereby a full supply of water may be kept therein, and discharged therefrom outside of the boiler, as and for the purposes specified.

136,215.—*Milk-Cooler.*—SETH F. COWLES, Coventry, Vt.

Two stationary reservoirs for water are supported by a suitable frame, and are provided with induction and eduction pipes for water, and have arranged between them the milk-discharging spout running transversely of the frame. Within each reservoir is placed the milk-pan, the inner edge of which is curved or arched for the better discharge of milk into the discharging-spout, and is provided with flanges around its upper edge to support the same on the upper edge of the reservoirs, and with a lip upon the inner end, below the flange, to support the pan and prevent it from slipping while the contents of the same are being emptied, the pan being tipped upward for that purpose by means of a suitable windlass arranged in the frame above.

Claim.—1. The combination of the two cooling-reservoirs B B' and the spout C, arranged as described, and their combination with the two milk-pans D D', the receivers being provided with the induction and eduction pipes, as set forth.

2. The combination of the windlass or shaft E and its line *e'* with the reservoirs B B', spout C, and pans D D', all being arranged together and in the frame A, as set forth.

3. The milk-pan, made with the curved or arched end, as specified.

4. The milk-pan, as made with the main and auxiliary flanges or lips *b c*, arranged as set forth.

136,216.—*Sawing-Machine.*—HUGH A. CURRENT, Clarksville, Tenn.

Two circular saws are placed so as to run between endless belts, which carry the wood to the saws and deliver it, after being cut, upon an apron, which carries it to the pile or other place of deposit.

Claim.—The arrangement of saws B B, broad carrier C, narrow carriers D having clamp-fingers F on plates G, and the rails I, as and for the purpose described.

136,217.—*Portable Fence.*—HORACE M. DAKE, Nunda, N. Y.

Pointed posts connected with the panels are driven in the ground. One of the rails of the next panel is entered obliquely behind a hook in the post last planted until a notch in said rail falls under a fixed pin above the hook, when the additional panel is brought to a level with the preceding and its pointed post is driven into the ground.

Claim.—The stake-post G provided with hook A and pin *d*, mortised cross-piece B, and notched board A, all constructed and arranged to form a portable fence, as and for the purpose specified.

136,218.—*Lantern.*—THOMAS A. DAVIES, New York, N. Y.

The pin on the lamp is held in the right-angled slot of the lantern by a drop-bolt.

Claim.—The drop-bolt E, in combination with the lamp, provided with pin D, and the body of the lantern having a right angled slot, as specified, whereby the bolt is raised by the pin when the lamp is adjusted in place, and then falls by its own gravity.

136,219.—*Washing-Machine.*—GEORGE R. DAVIS, Nobleville, Ohio.

In a rectangular box is placed a frame of rollers; above these is a movable frame with a series of rubbers in a curved form. This frame is operated by an arm and a pivoted lever. Another lever is hooked at the back end of the box, and has attached to it a frame with two friction-rollers for the purpose of pressing upon the movable frame of rubbers.

Claim.—The combination, in a washing-machine, of the frame C having the revolving rollers B B, with the arched frame D having the stationary rubbers *d' d' d'*, the beam F, standard G, and anti-friction bearings *g g*, lever E and cross-bar E', all constructed and arranged substantially as and for the purpose above set forth.

136,220.—*Hand-Cultivator.*—LANSING J. DAWDY, Hamburg, Iowa.

A pair of handles, supported at one end upon a single wheel, constitutes the frame. A thin horizontal knife is attached to the under side of the handles, just in rear of the wheel, by means of curved adjustable rods, in such manner that the adjustment changes the angle of the cutting-blade.

Claim.—The within-described garden-implement, consisting of the frame A B, wheel C, knife G, and bows D D, pivoted at one end and perforated at the other end, by which means they are made adjustable, all substantially as set forth.

136,221.—*Cylinder-Cock.*—DAVID B. DENNISON, Ottumwa, Iowa.

The cylinder-cocks of a locomotive are operated simultaneously by a bar with beveled ends, and to the center of said bar the levers and rod leading to the engineer's cab are connected. When the rod is drawn upon the valves are raised by the beveled ends of the bar.

Claim.—The cocks A A, in combination with the beveled bar D, the valve-stems of said cocks being operated upon simultaneously by said bar at the will of the engineer, all arranged substantially as herein set forth.

136,222.—*Car-Coupling.*—MELVIN C. DOUBLEDAY, Sharon, Vt.

The coupling-box is pivoted in the draw-head, so that either the hooks or the pin may be presented to the approaching car.

Claim.—1. The spring-pressed coupling-bars F F and box H made reversible through the slots J, as and for the purpose described.

2. The combination, with spring-pressed bars F F, of the sliding spring-held jaw M and pin L, arranged as and for the purpose set forth.

136,223.—*Candlestick.*—CHARLES H. DOUGHTY, Newburg, N. Y.

Two plates, having a rectangular notch cut in each, are so slotted as to cross each other at right angles, the notches forming the candle-socket.

Claim.—1. A candlestick having an open socket, formed by the edges of vertical plates or the like, arranged to hold the candle and allow the drip to fall to the bottom plate, substantially as specified.

2. The standard and socket of notched plates B, constructed, arranged, and connected together as shown.

136,224.—*Privy-Indicator.*—WILLIAM C. DUFFIELD, Wheeling, W. Va., assignor to himself and JOSEPH A. FARIS, same place.

A board with the words "Vacant" and "Occupied" is mounted upon the upper end of a rod, which, by suitable mechanical connections with a depressible seat and floor, causes the word

"Vacant" to occupy an opening in the wall of the privy when the seat and floor are in an elevated c ndition, and the word "Occupied" to appear when the seat and floor are depressed.

Claim.—The combination and arrangement of the hinged seat A, floor A', slide F, and connections D B C C, constructed and operating as herein described, to cause the word "Vacant" or "Occupied," or their equivalent, to show through the aperture G, for the purpose explained.

136,225.—*Apparatus for Pressing and Packing Tobacco.*—JOHN K. KANICKSON and JACOB R. HARRIS, St. Louis, Mo.

The tobacco is first pressed in layers in a sectional tube composed of shouldered and beveled rims, division-plates being placed between the layers. The air having been expelled from the tobacco, the layers are removed, together with the plates, from the tube, and the tobacco then replaced in the tube and pressed or packed into the caddy.

Claim.—1. The rim B, provided with the bead C and flange D, forming part of an apparatus for pressing or packing tobacco, substantially as shown and described.

2. The rim B, provided with the bead C and flange D, in combination with the plates E, as and for the uses and purposes substantially as shown and described.

3. The rim B, provided with the bead C and flange D, in combination with plates E, arranged relatively to a caddy, A, substantially as shown and described.

4. The rim B, provided with the bead C and flange D, arranged relatively to the caddy A, substantially as shown and described.

5. The means herein described, consisting of the rim B, plates E, caddy A, and plunger G of a press, as a method of expelling the air from tobacco, substantially as shown and described.

136,226.—*Rotary Churn.*—BOLIVAR EASON, Easonville, Ala.

A bracket for holding the churn-dasher stem is secured removably to the upright post by a button. Inclined longitudinal beams bear a roller for tightening the belt. The churn may thus be removed easily.

Claim.—The churning-machine having the removable dasher-stem bracket C', arranged to be clamped and unclamped by the button between the frame-posts, and the upper inclined beams and tension-roller arranged to tighten and loosen the holding-band, as shown and described, and for the purpose set forth.

136,227.—*Railroad Crossing.*—GEORGE ELLIOT, St. Louis, Mo.

The crossing is supported by a rigid iron frame, which fits the webs of the several rails, the outer angles being re-enforced by angular fish-plates, all firmly united together by bolts.

Claim.—1. The frame C C', constructed to enter the recesses a between the base and cap of the rails A, so as to enable the attachment thereto of the rails by means of bolts or rivets B passing through the web of the rails.

2. The combination of the rail-sections A, bolts or rivets B, frame C C', and angle fish-plates, substantially as set forth.

136,228.—*Carburetor.*—WILLIAM B. ELSTON, Marshall, Mich.

Claim.—1. The sealed single cylinder A, revolving on suitable bearings and having transverse and longitudinal partitions, and the elbow-shaped inlet and outlet pipes m p, all arranged and operating in the manner and for the purpose set forth.

2. The inlet-openings between the chambers e^1, &c., and the space g provided with casings $e\ e$ and communicating tubes, substantially as described, and as shown in Fig. 5.

3. The outlet-openings from the central chambers e to the forcing-head f, provided with casings n having the openings o and elbow-pipes t, substantially as described, and as shown in Fig. 6.

4. The valve C in the carbureting-chamber, formed with a slitted edge, constituting wings and wedge-shaped openings, as shown in Fig. 7.

136,229.—*Rectifying Charcoal Used in Rectifying Spirits.*—ALBERT ERNST, Baltimore, Md.

Sulphuric acid, chloride of lime, cream of tartar, and water.

Claim.—The compound hereinbefore described, for restoring and purifying charcoal employed in the rectifying of spirits.

136,230.—*Combined Ruler and Pencil-Sharpener.*—WILLIAM H. FLANIGAN, Philadelphia, Pa.

One edge has a V-groove, coated with sand or emery, to provide a pencil-sharpener.

Claim.—The V-shaped groove a, coated with sand, emery, or other equivalent material, in an edge or side of a ruler, substantially as and for the purpose set forth.

136,231.—*Seed-Planter.*—REUBEN FRIDAY, Crockett, Tex.

A rectangular frame, having cultivating tools affixed to it, has pivoted in it, in a lateral position, a rolling seed-box, of cylindrical form at its ends, the remaining surface formed of large serrations extending from end to end, with a seed-orifice in the middle of the length of each.

Claim.—The combination in a seed-planter, with the dropper and furrow-opener, of the pulveriser C, arranged in front thereof and in line therewith, as and for the purpose described.

136,232.—*Sash Fastener and Tightener.*—THERON FROST, Piermont, N. Y.

The sides of each of the sash-receiving grooves is lined with rubber, making elastic cushions throughout for the sash to bear against. There are also movable flexible supporting-strips, held in place by staples in the window-frame, and a clamp-screw, having its head lapped upon one of the movable strips, and a screw-nut projecting through the window-frame, whereby the strips are drawn together and the cushions clamped in desired positions.

Claim.—As an article of manufacture, the combined sash fastener and tightener herein described, consisting essentially of the plates C D, constructed, respectively, with the slotted flange c and lugs F, the case D', and the tooth E, constructed with the shoulder e' and tooth e, all combined as described.

136,233.—*Boot-and-Shoe-Heeling Machine.*—CHARLES W. GLIDDEN, Lynn, Mass.

The nail-driving mechanism receives the peculiar elastic blow from the piston of an air-engine.

Claim.—The combination, in a heeling-machine, of a driving mechanism and a piston actuated by air, steam, or equivalent force, for the purpose of an elastic blow.

136,234.—*Chimney-Top.*—JAMES GORTON, New York, N. Y.

The bridges are sprung into place and retained in slots by keys or wedges, so that the parts can be readily united or detached for packing.

Claim.—The removable bridges $e\ e^1\ e^2$, secured, as described, in the position shown, in combination with the flue A, conical top B, spout b, and vertical arbor C, all constructed and arranged as herein shown and specified.

136,235.—*Mechanism for Feeding Nail-Plates.*—ROYAL C. GRANT, Middleport, Ohio.

A bell-crank lever is connected by one of its arms to an eccentric or other motion-giving device, and by the other to a slide, which carries a pawl that engages with a ratchet, by means of which the carrier is intermittingly turned half-way round, and the plate in its reciprocation actuates a lever and pawl, which latter, through the medium of a ratchet-wheel, rotates a shaft on which is a pinion that gears with a rack connected to the carrier, by which means the forward feed is effected. The holding jaws are connected to the carrier by a universal joint; a spring and stud on the die-block, between which the plate is fed, holds the plate in the right position laterally, and a detent, set by a weighted lever, is tripped by a stud on the carrier to allow a cord, with a weight attached, to draw the carrier back when the jaws have approached to within a certain distance from the cutters.

Claim.—1. The spring W combined with pin v, bed-die B, and a plate-holder provided with mechanism to turn it, as and for the purpose described.

2. The mechanism R e T V I J, arranged substantially as described, for revolving the tube E a half-revolution, as set forth.

3. The lever P combined with pawl p and ratchet G, as described, so that the end of said lever will serve as an elevator to the carrier-pawl and a detent to the ratchet, at the times and in the manner set forth.

4. The mechanism L M N O P, substantially as described, for throwing out the feeding-pawl A, as set forth.

5. The combination, with the mechanism for throwing out the feeding-pawl, of the spring-lever Q and stud a' on rock-bar, as and for the purpose set forth.

6. The bed-die B provided with guide-pin v and spring-guide W, combined with a plate-holder, C, and rotary carrier D, coupled by a union-joint, as described, so that the simple turning of the plate on the bed and against the said spring and guide will enable plate to clear the knife.

7. The slide I provided with stop i, the lever H, weighted pawl A, and the detent-pawl p, combined with the ratchet G, as described, so that the plate will be drawn back at the time and in the manner set forth.

136,236.—*Dovetailing-Machine.*—FRANCIS D. GREEN, Williamsport, Pa.

By this machine the various dovetailed joints, square tenons, and grooves for the glass are formed in sash, stiles, and rails.

Claim.—1. The carriage-frame adapted to be adjusted unequally at the ends, as and for the purpose set forth.

2. The combination of the adjusting-screws g g g' g' with the sword D of the spindle C and the adjusting-screw d', as and for the purpose described.

3. The vertically-adjustable sword K, provided below with arms k^2, pulley-shaft and pulleys k^3 and k^4, and above with the arbor K' carrying the cutter-head k^5, all constructed and arranged as and for the purpose set forth.

136,237.—*Car-Coupling.*—JEREMIAH GROWDON, New Enterprise, Pa.

To place the link in an inclined position for coupling the guide-plate is moved inward until the hook catches on the link; then, by moving the lever, the link can readily be placed and held in the proper position for coupling.

Claim.—The guide-plate I, provided with a hook, i, and placed under the coupling-link in a draw-head, and operated substantially in the manner and for the purposes herein set forth.

136,238.—*Thrashing-Machine.*—CHARLES S. HALL, Rochester, N. Y.

Grain-belts so arranged that large amount of belt-surface is secured without increase of length in frame of machine. Peculiar grate, as shown.

Claim.—1. The relative arrangement, in grain-thrashing separators, of the primary and secondary belts C and D, in combination with the thrashing-cylinder H, chute-grate G, beater E, and pickers F and F', and the ordinary open raddle a, as and for the purposes set forth.

2. The swinging or adjustable grate G, having the interstices i, open at the outer edge, substantially as shown and described, for the purpose set forth.

136,239.—*Safe-Door Hinge.*—JOSEPH L. HALL, Cincinnati, Ohio.

One leaf of the hinge has a recess in its upper edge, and placed thereon is a swinging or crank-shaped plate that connects the two leaves and permits the other leaf, with the door to which it is attached, to be moved out from its recess before any rotation takes place. This method of hanging the door is rendered necessary by means of the tongues and grooves in the body of the safe and the door, to prevent opening by wedges.

Claim.—1. A hinge consisting of a leaf, A, having its pintle arranged to swing laterally in a recess therein, in combination with a leaf, B, arranged to move with said pintle and rotate thereon, substantially as and for the purpose set forth.

2. The leaf A, provided with the shoulder G H, in combination with a leaf, B, provided with the projection I, substantially as set forth.

136,240.—*Fruit-Jar.*—ELIA G. HALLER, Carlisle, Pa.

The jar is constructed with lugs blown upon the inside of the neck, and with a plain ring around the top of the outside, which is formed from plastic glass, and the jar is provided with a hollow stopper, having an aperture in its bottom, and with inclined grooves upon its outside, arranged so as to engage with the lugs in the inside of the neck of the jar, so that the stopper may be forced into the jar by simply turning it, and a tight joint thereby effected.

Claim.—1. A blown-glass stopper with an inside chamber having a central opening at the bottom only, as and for the purpose set forth.

2. As an article of manufacture, a glass jar having its neck provided on the inside with blown lugs a^1, and on the outside with a plain ring, a^2, as and for the purpose set forth.

136,241.—*Vapor-Engine.*—JOHN F. HASKINS, Fitchburg, Mass.

A generator in which vapor is produced from an easily-volatilized fluid by the heat of exhaust steam is provided with water-pipes connected with a reservoir, by means of which water may be forced into the generator to condense the vapor and prevent the further production thereof in case of a break or leak in the apparatus, which would subject persons to the noxious qualities of the vapor.

Claim.—1. In combination with the steam chamber c and liquid and vapor chamber or vessel b and their respective inlet and outlet pipes, the water supply pipes i, for throwing water into the steam chamber to condense its steam and cool the vessel b, substantially as described.

2. The method of producing and stopping the supply of heat to volatilize the liquid from which the vapor is to be generated by subjecting the generator to the action of steam to heat the generator and volatilize its liquid, and the steam chamber and the generator to the action of water under pressure to condense the steam and cool the generator.

136,242.—*Railroad-Train Indicator.*—SAMUEL W. HEMKEWAY, Lansing, Iowa

An indicator representing the train is caused to travel in the slot of an indicator-board, upon which the various stations are marked by means of a screw-rod and suitable propelling mechanism.

Claim.—A revolving screw, C, provided with pointer-nut D F L, and geared to a shaft, E, driven by suitable mechanism, when combined with an indicator-board having guiding-ways and bearing the station, time, and distance scales, arranged as and for the purpose described.

136,243.—*Extension Table.*—AUGUST HERZOG, New York, N. Y.

The center leaf or top of the table is vertically adjustable by means of spiral springs that force it up when the outside or extension leaves are drawn out. Said extension leaves are attached to the end frames of the table, which are connected with the divided side frame. When the table is extended, hooks that are attached to the central frame are locked over the side rails of one of the extension frames, and thereby hold the central part of the table in position.

Claim.—1. The combination, with a vertically-adjustable leaf or leaves D, of the spring d, arranged about a pin pendent therefrom, and supported on a frame, f, as and for the purpose described.

2. The combination, with leaf or leaves D, of the hook g, arranged to look on the rail b, as and for the purpose set forth.

136,244.—*Stereotype Block Holder.*—MARSHALL J. HUGHES, New York, N. Y.

By means of blocks friction is applied to the rectangular projection from the under side of a stereotype-plate to keep the plate in place. The projection is rectangular or parallel-sided, and not dovetailed, so that by merely loosening the furniture the stereotype-plate may be withdrawn vertically.

Claim.—A stereotype-plate, provided with a vertical rib or flange having its sides parallel, as described.

136,245.—*Plow.*—JOHN T. HUNTER and DANIEL L. H. MITCHELL, Forest, Miss.

An adjustable beam, acted upon by a spring-follower to hold the subsoil point to its work, a set-screw, f, being provided to regulate the depth of penetration.

Claim.—1. The combination of the beam G with the collar H and its spring follower, as and for the purpose set forth.

2. The combination of the adjustable beam G, collar H, and the set-screw f for regulating the beam, all substantially as set forth.

3. The combination of the beam G, with diagonal dovetailed groove in one side, with the subsoiler I provided with a slotted shank, m, which is passed into said groove and held by a set-screw, all substantially as set forth.

136,246.—*Machine for Making Paper Boxes.*—GUSTAV L. JAEGER, New York, N. Y.

Pasteboard, printed between rolls, is cut and creased by a roll into blanks, the edge of which is pasted as it passes another roll. This blank is fed under a plate which covers it between lines upon which its sides are folded vertically, in which position it is fed between side-guides to and between the last folders, which, moving in successive order, lay the flap c^2 upon the pasted flap and complete a box tube, the ends of which are folded in by hand.

Claim.—1. A machine for making boxes, composed of printing-rollers E D, cutting rollers G H, pasting-rollers J K, and folding-wings g g' g g', all arranged and operating substantially in the manner herein shown and described.

2. The creasers b, each made of a series of detached punches or cutters, in combination with the knives a a', which serve to cut out and crease the box, substantially as set forth.

3. The segmental pasting-section K^6 of the roller K, in combination with a paste-fountain, L, and rollers M N, constructed and operating substantially in the manner shown and described.

4. The folding-wings g g' g g', mounted on shafts A A', in combination with tappet-rods $k\ k'$ acted on by cam m, substantially as set forth.

5. The stationary guide-plates c c', in combination with the folding-wings g g' g g' and the intermediate carrying rollers Q Q', all constructed and operating substantially as shown.

136,247.—*Bosom, Collar, and Similar Articles of Apparel.*—ASA JOHNSON, Brooklyn, N. Y.

Covers shirt bosoms, collars, and similar articles of wearing apparel with a coating of glass.

Claim.—1. A shirt bosom, collar, or other similar article of wearing apparel, formed of or enveloped with transparent glass, substantially as herein set forth.

2. A shirt bosom, collar, or other similar article of wearing apparel formed of a hollow glass case with wire-cloth or other suitable material inserted in the same, substantially as herein set forth.

3. A shirt bosom, collar, or other similar article of wearing apparel formed of a hollow glass case, and within the same wire-cloth with beads attached, substantially as herein set forth.

4. A shirt bosom, collar or other similar article of wearing apparel made of glass substantially in the manner herein set forth, and having designs or figures painted, printed, embossed, impressed, or otherwise formed on or affixed to either surface, as herein described.

5. The process of covering shirt bosoms, collars, or other similar articles of wearing apparel with glass by dipping the same into melted or liquid glass, substantially as herein set forth.

136,248.—*Railway-Car Truck.*—MATTHEW H. KOLLOCK, Philadelphia, Pa.

Claim.—The combination of the ball b of the axle C and the socket c in the front end of the connecting-rod H, the rear end of the rod being connected with the crank I', in the usual manner, substantially in the manner and for the purpose specified.

136,249.—*Cultivator.*—HOSEA K. KNEBLE, Landsdale, Pa.

A straddle-row cultivator, for a single horse. The inner triangular frame, having handles, is pivoted to the outer frame, so that it may be swung to either side. In operation, three hoes pass between two rows, while one hoe passes between the next two rows.

Claim.—1. The combination of the frames A and D, constructed and arranged as shown, the said frames being pivoted or hinged together in front so as to permit the inner frame to be swung from side to side, as and for the purpose set forth.

2. The cultivator consisting of the triangular main frame A holding the plates a, cross-guides a^1 with holes a^2 and standard a^3 and shovels C, and the pivoted frame D having shovels E^1 and handles E^2, substantially as specified.

136,250.—*Transmitter for Printing-Telegraph.*—LANDY TURNELL LINDSEY, Jackson, Tenn.

For open circuit printers whose type-wheels have a continuous motion, the printing being done by closing the circuit.

Claim.—One or more series of transmitting knobs, a, forming one end, and a shaft, S, with spring w, forming the other end of a broken line, in combination with anvils b, connecting-wires d and sectional ring H, all arranged substantially as herein described, so that the circuit will be closed when the spring is in contact with any one of the sections of the ring, and the corresponding knob depressed, for the purposes set forth.

136,251.—*Telegraph-Repeater.*—LANDY T. LINDSEY, Jackson, Tenn.

Circuit through a repeating or sounding magnet closed after its relay-circuit is broken by its own lever, again closing the same circuit. This circuit is broken by the action of the opposing relay, closing a shunt-circuit.

Claim.—1. The combination of the lever L of a sounder magnet, H, spring s, post n''', and electrical connecting-wires, for the purpose of keeping the circuit of the sounder-magnet closed through it beyond the time allowed by the contact of the armature-lever of the relay-magnet with its adjusting-screw, substantially as herein set forth.

2. The combination of the adjusting-screw t', lever D of the relay-magnet M, lever L' of the sounder-magnet H, post n', and electrical connecting-wires, for the purpose of forming a shunt-circuit to weaken the current in the sounder-magnet H, substantially as herein set forth.

3. The combination of the lever L' of the sounder-magnet H, post n, sounder-magnet H, lever D of the relay-magnet M, adjusting-screw t', and electrical connecting-wires, for the purpose of preventing both main-line circuits from remaining open or broken at the same time, substantially as herein set forth.

136,252.—*Box for Assorting Peaches.*—EDWARD W. LOCKWOOD, Middletown, Del.

An open box, provided with an inclined bottom formed of slats rounded on top to prevent injury to the peaches in their descent. The

peach-leaves fall through between the bars, and the soft ones are removed by an attendant.

Claim.—The open box A B, provided with inclined bottom, formed of slats rounded on top, so that the peaches will roll down and allow a picker to remove the faulty fruit, while the leaves will pass through, as described.

136,253.—*Power-Hammer.*—JOHN M. LOVE, Hamilton, Ohio, assignor to LOVE AND ALLSTATTER, same place.

Sliding frames, dovetailed to embrace the housings and raised by adjusting screws, carry the hammer and operating mechanism. The cam that operates the hammer has a dovetailed portion sliding in a head fixed to the driving-shaft, and held by screws projecting through slots in the face. Screws bearing against the shaft on two sides adjust the stroke of the hammer. A brake fastened to a shaft journaled in the sliding frame and held against the driving-wheel by a weighted arm, is provided with a belt-tightener and treadle, so arranged that when the treadle is depressed the brake is loosened and the belt tightened.

Claim.—1. In combination with the stationary frame A B B', the vertically-adjustable frames or slides F, carrying the swinging hammer and its driving mechanism, substantially as and for the purpose specified.

2. In combination of sleeve K *k k'*, yoke L *l*, springs N, and hammer-arm P connected to the frame A, and operating so as to permit the hammer to vibrate independent of the vibrating-yoke L, substantially as described.

3. The combination of pulley U, treadle Y, brake *t*, and belt-tightener *w v*, operating substantially as and for the purpose specified.

4. The combination of fixed head *e* having a groove, *f*, and slotted cam S *i* having a tongue, *g*, and being adjustably secured to the head *e*, substantially as and for the purpose specified.

136,254.—*Cultivator.*—KENNETH MCKENNON, Pleasant Hill, Ala.

A share for loosening the subsoil in combination with a wing or share for turning or loosening the surface. The turning-wing is attached to a grooved standard, and adjustable to different heights.

Claim.—1. In combination with the front and rear standards C and D, united to each other, as described, the adjustable grooved standard F with its foot *k* and cultivator-share, constructed and arranged substantially as described.

2. In combination with the adjustable standard F and cultivator-share, arranged as described, the notches *s* in the front standard C for securing and bracing the notched point of the share at any height corresponding with the adjustment of the supporting-standard F, substantially as described.

3. The cultivator-shares G H I, provided with notches *t u* at their upper and lower points of attachment to brace them laterally to the standard C F, to which they are secured.

4. The combination and arrangement of the standards C D and the adjustable standard F with their foot-branches *c*, *d*, and *k*, the subsoil-point E, and the cultivator-share made adjustable in the notched standard C, the several parts being constructed and arranged for use as described.

136,255.—*King-Bolt for Carriages.*—JOHN L. H. MOSIER, New York, N. Y., assignor to BREWSTER & COMPANY, same place.

The king-bolt has a curved cross-head which is inserted within a recessed top plate. The bottom plate is secured to the head of the king-bolt by bolts passing through the bed piece.

Claim.—The combination with the bed A of the curved cross-headed king-bolt D *d'*, recessed top plate B, bottom plate C, and bolts E E, as and for the purpose described.

136,256.—*Elastic Check-Rein.*—JAMES NEALEY, JR., and THOMAS P. KENT, Bangor, Me.

The rein is composed of flat elastic webbing rolled up and covered with braided thread, like whips.

Claim.—In an elastic check-rein, the cord *d*, constructed, as herein described, from flat elastic fabric *a*, rolled as at *b*, and covered with braided webbing *c*, substantially as herein set forth and shown.

136,257.—*Plow.*—JAMES R. NICHOLS, Bastrop, Tex.

Claim.—The plow-cutter E having bead *e'* at one end, sharpened at the other, and perforated at different points, as described, to adapt it to be used with a sweep or plow, in the manner described.

136,258.—*Pump.*—HENRY NORMAN and CHARLES F. DIETRICH, New Orleans, La.

The pump is provided with two independent valve-chests, each provided with a suction and a discharge valve, and each connected by pipes with the piston-cylinder, well, or reservoir and the discharge pipe. Thumb-screws are inserted through stuffing-boxes at the base of each valve-chest, the points of which approach the stems of the suction-valves, so that on turning the thumb-screws the valves may be lifted from their seats, thus enabling the operator to render the pump single-acting, double-acting, or non-acting, at pleasure.

Claim.—The valve-chests F F, having valves H H and H' H', when the former are provided with valve-stems h h and the set-screws K K, the whole being so combined and connected with a cylinder and piston and a suitable means of discharge as to operate either as a single or double acting pump, substantially as described.

136,259.—*Air-Engine.*—HENRY NORMAN and CHARLES F. DIETRICH, New Orleans, La.

An ordinary pump is connected by suitable pipes with two pressure-cylinders, having each a weighted suction-valve and an outlet-valve. The connecting-pipe of one of the pressure-cylinders enters the pump-cylinder at a point above the highest stroke of the piston, and the other correspondingly below. The apparatus being properly supplied with water, at each up-stroke of the piston the water in one pressure-cylinder follows the movement of the piston, thereby admitting air through the suction-valve of that cylinder, while at the same time the water, being forced into the other cylinder, compresses the air in that cylinder and forces it out of its discharge-valve. At each down-stroke the operation is reversed.

Claim.—The cylinder C, piston C', pressure-cylinders D D' having valves *d d* and *s s*, and pipes G G', the whole being so combined and arranged as to operate substantially as described.

136,260.—*Grain-Drill.*—CHARLES E. PATRIC, Springfield, Ohio.

A seed-box, placed laterally on a frame with running wheels. A seed-shaft beneath it, revolving in droppers, has on its end a series of cones actuated by an endless belt from another series on one of the running wheels. By sliding the shaft endwise and allowing a latch to drop into one of two circular recesses the position of the cones is changed, and with it the intervals of seed-dropping. The drag-bars are attached alternately to two laterally-pivoted bars, and are made to keep in line or otherwise by means of a right-and-left-hand screw-thread on a shaft extending to the rear operating-nuts, swiveled to the pivoted bars. Chains attached to the drill teeth become wound round a roller as the latter, by pinions, passes up racks at the rear. This movement actuates a device to throw the cones in and out of gear.

Claim.—1. In combination with the rocking-bars C C' and drag-bars D' of a grain-drill, a right-and-left-hand screw for shifting the position of the hoes, substantially as described.

2. In combination with the seeding devices of a grain drill, an adjustable cone of sprocket-wheels or pulleys for varying the delivery of the grain, substantially as described.

3. In combination with the gearing for driving the seeding devices of a grain-drill, the angular or curved sliding bar N and sliding bar O, substantially as described.

4. The combination of cone F, disk G, bar O, plate or fork O', bar N, plate M, and wheel A provided with pin *g*, substantially as described.

5. The combination of cones F F', chain I, shaft D provided with grooves *p p'*, and latch *h'*, substantially as described.

136,261.—*Furnace for Chloridizing Ores.*—IRA M. PHELPS, Chicago, Ill.

Claim.—1. The process of chloridizing sulphureted silver-bearing ores, so as to prevent the escape of the disengaged chlorine and uniting it with the silver, and at the same time preventing the escape of the silver by volatilization before the chloridization is effected, by forcing said ores through a heated pipe or pipes without bringing said ores in contact with the flame from the furnace, substantially as specified.

2. In the process of chloridizing sulphureted silver-bearing ores, the use of the horizontal heater-pipe D, and horizontal chloridizing pipes E, substantially as and for the purpose specified.

3. In a chloridizing-furnace, the combination and arrangement of the horizontal heater-pipe D, horizontal chloridizing pipes E, and chambers F, substantially as and for the purpose specified.

4. Chloridizing sulphureted silver-bearing ores within heated pipes, in connection with a hot-blast, substantially as specified.

136,262.—*Knitting-Machine Needle.*—CORWIN H. PLATT and GEORGE A. STARBUCK, Norwalk, Ohio.

The needle, which has only an endwise reciprocating motion, is made of the same width throughout its entire length, and its point is made at a right angle with its flat upper side and rounded at the under side, so as, in the forward motion of the needle, to surely push off the old loop from a stationary stripper to which it was removed in the backward motion of the needle. A longitudinal groove is preferably made in the upper side of the needle for the stripper to work in.

Claim.—1. As an improvement in knitting machines, a reciprocating needle, constructed substantially as described, operating in combination with a stationary or fixed comb tooth or stripper, substantially as and for the purpose specified.

2. The needle A, having its end or point *e* formed substantially as described, so as to remove the loop from the stripper and transfer it to the web, substantially as set forth.

136,263.—*Manufacture of Fuel.*—MARTIN RAE, Uphall, North Britain.

The tarry oil is distilled in a series of vessels, the last portion being reserved so as to moisten the coal-dust as it is fed into a mixing-mill, where it is combined with the tar from the stills. The mixed tar and dust is formed into blocks and passed through a kiln and baked.

Claim.—1. The preparation of bituminous mastic from shale-tar, and the use and application of the same in conjunction with either coal-dust, small coal, coal-dross, coal-slack, bituminous shale, spent shale, bituminous blue or cooly blue, peat, spent tan, sawdust, and coke-breeze, all by preference in a state of division, or with mixtures of two or more of the same, for the preparation of fuel, as herein set forth.

2. The combination and arrangement of machinery or apparatus for the manufacture of artificial fuel, substantially as hereinbefore described, and illustrated by my drawing.

136,264.—*Combined Atmospheric Exhaust Pump and Funnel.*—GEORGE H. RANDALL, Forestville, Md., assignor to himself and WILLIAM H. WOODS, same place.

A sleeve is closely joined to a funnel, and extends a sufficient distance down to enable its end to reach within a receptacle for the liquid. In this sleeve an air-exhaust pump is placed. The exhaustion of the air from the vessel to be filled removes the counter-pressure, thus utilizing the outside atmosphere to force the syrup rapidly into the receptacle.

Claim.—The combination of an air-exhaust pump with a funnel for liquids, as and for the purpose described.

136,265.—*Machine for Holding and Soldering Cans.*—JAMES REDHEFFER, Kansas City, Mo.

The wedge shaped sliding plate is clasped at each of its edges into cleats, and expands or contracts the cylinder to any desired diameter.

Claim.—In combination with the cylinder A the clasp or lock cleats D E, and the clasp or locked sliding plate F, arranged to operate as and for the purposes described.

136,266.—*Harvester-Cutter.*—SAMUEL H. REED and THOMAS THOMPSON, Fredericktown, Ohio.

Cutter-sections, with downwardly-projecting lips at their rear ends, are inserted through an opening at one end of the cutter-bar, and slipped laterally and retained by the lip and a retaining-bar in front of it. The last section has a set-screw penetrating one side, by which displacement is prevented.

Claim.—1. The bar A provided with the opening *b*, groove *c*, shoulder *d*, and set-screw C, as and for the purposes set forth.

2. In combination with the bar A with opening *b*, groove *c*, shoulder *d*, and set-screw C, the knife-sections B having ribs *e* on their inner edges, all substantially as shown and described.

136,267.—*Machine for Corrugating Sheet-Iron.*—ABRAM REESE and JACOB REESE, Pittsburg, Pa.

A series of pairs of corrugated rollers supported in a frame, so arranged that the sheet is corrugated progressively, and the corrugations increase in number as it passes from pair to pair of the rollers.

Claim.—1. A machine for corrugating iron, consisting of a supporting-frame, C, or its equivalent, and four—more or less—pairs of corrugating-rollers, constructed and arranged substantially as shown and described.

2. The gear-wheels H and I in combination with the corrugating-rollers A and B, substantially as and for the purpose described.

3. A corrugating-machine with the rollers so formed and arranged that the sheet is corrugated progressively, and the corrugations increased in number from one pair of rollers to another, substantially as described.

136,268.—*Wagon Body and Seat.*—PETER S. RICH, Avalanche, Wis.

The sides and corners of the body are formed of single pieces, and are secured by end pieces. The seat, having bent sides and straight back, has arm pieces extending from the back to the front end, which are supported by stay-irons.

Claim.—1. The side-pieces A A bent to form rounded corners B, combined with end-pieces C C, as shown and described, and for the purpose set forth.

2. The arms K K combined with top of side bent and straight-backed seat J, as and for the purpose described.

3. The sides A, end-pieces C, dash-board F, bow G, seat J M, and arms K, combined with angle-irons E H, stay-irons L, and ovals I I, to form an improved wagon-body, as described.

136,269.—*Screw-Cutting Machine.*—JOHN W. ROW, Lewisburg, Pa.

The bed is arranged to receive dies or clamping-jaws, and is raised and lowered by a rack depending from the bed and a pinion operated by a foot-wheel. The bed has a clutch-nut attached to it, by which it is engaged with or disengaged from a vertical feed-screw which is operated by a ratchet and pawl, the latter being actuated by a cam on the drill-shaft.

Claim.—1. The arrangement of the sliding frame or die-holder E *e* in the guide ways F, when provided with the clamping-screw bar *f*, hinged jaws *f g*, and cam-headed lever *e*, together with the rack C, by its connecting-arms D, operated by the pinion *b* on the shaft B, with its foot-wheel Q, the whole substantially combined and operated in the manner and for the purpose specified.

2. In combination with the drill-spindle J and its appliances, the arrangement of the cam R in its bearings with the spring S and rod U for operating the pawl W and ratchet T in combination with the feed-screw Z, all arranged and operated substantially as and for the purpose set forth.

136,270.—*Windlass for Hoisting-Machines.*—JOHN RUSHWORTH, New York, N. Y.

The drum-shaft carries the clutch mechanism and large gear-wheel, the latter connecting with the gear-wheel upon the lower shaft, to which the clutch-lever is attached.

Claim.—The shaft F and gear-wheels H and I, in combination with the shaft E, clutch C, lever K, and drum A, all arranged and operating in the manner and for the purpose described.

136,271.—*Wire-Mattress Frame.*—JOHN G. SMITH, St. Louis, Mo.

An adjustable piece is attached to the side and end rails. In the side of this piece is a slot and clamping-screw. A set-screw is inserted in the end of the piece which abuts against the end of the rail. By releasing the clamping-screw and inserting the set-screw the tension of the fabric is increased.

Claim.—The combination of the side rails A, end bar or rail E, and adjustable pieces C C', when the latter are provided with flanges *c'*, slot *c*, clamping-screw B, and set-screw D, all arranged substantially as and for the purpose set forth.

136,272.—*Railway Snow-Plow.*—PETER A. SMITH, New York, N. Y.

A double-walled plow, the outer wall perforated and the inner section divided into separate chambers, so that one or both sections may be used, according to the depth of the snow. Steam is admitted to each chamber by separate pipes, and is driven against the snow through the outer perforated wall.

Claim.—A snow-plow, double walled to form chambers *c' c''*, perforated in its outer shell to allow exit of steam, and provided with a distinct steam-inlet pipe for each chamber, as and for the purpose described.

136,273.—*Broom.*—STRAKUS STANDISH, Eureka, Nev.

The sheet-metal head is provided with a screw-threaded socket and has its wider sides inclined toward each other. The handle is also screw-threaded, and presses against a wedge that enters between the butts of the broom-corn, and thus secures the material firmly in the head.

Claim.—The screw-threaded handle B and the wedge C, in combination with the sheet-metal head A provided with the screw-threaded socket E, and having its wider sides inclined toward each other, all constructed and arranged in the manner and for the purpose herein set forth.

136,274.—*Duplex Telegraph-Instrument.*—JOSEPH B. STEARNS, Boston, Mass.

Key adapted to close simultaneously circuits from main battery through relay-magnet to main line, and from a local equalizing battery through a compensating relay-magnet.

Claim.—1. A key, consisting of the levers *a b c*, with their respective contact-stops, combined and arranged as and for the purpose set forth.

2. The combination of the key above described with a coil or magnet excited by the main-line battery, an opposing or neutralizing magnet or coil, local battery, and resistance, as and for the purpose as set forth.

136,275.—*Billiard-Light.*—WILLIAM ST. MARTIN, Cincinnati, Ohio.

The adjustable sleeve on the main stem has rubber friction-pads fastened in inclosing cases and provided with suitable tightening devices. The shades may be independently set at any desired angle by means of the jointed arms. These arms are attached to a sleeve adjustable on the main sleeve which carries the lights.

Claim.—1. The combination, with the sliding tube of the friction device composed of rubbers F F, the cases U C inclosing the rubbers, and the set-screws D D, as a means of regulating the position of the sliding tube upon the supporting-rod.

2. As a means of securing my friction-clutch to the sliding tube, the tightening device, consisting of the band *e*, screw *f*, and the straps or links E E, substantially as described.

3. The combination, with the sliding tube of a hanging lamp, of the jointed arms B B, and the two rectangular-shaped reflectors, substantially as described, for the purpose of concentrating the light of the two lamps upon any desired rectangular space beneath them.

136,276.—*Sofa-Bedstead.*—JAMES K. STOCKTON, New York, N. Y.

The detachable back is cushioned on both sides and is hinged to an intermediate connecting-cushion, which is in turn hinged to the sofa-seat. Said seat is pivoted at each end. When used as a bed the cushioned back forms the outer section of the extension, and is provided with a hinged foot-board and sliding legs.

Claim.—1. The cushion C hinged to the front edge of the sofa-seat B, to be folded away under the same and constituting the connection between said seat and the sofa-back, as specified.

2. The combination of the hinged foot-board K and sliding legs *f f* with the folding sofa-back D, substantially as described.

136,277.—*Fertilizer.*—JOHN W. STUBBS, Cheraw, S. C.

Attached beneath a plow-beam is a frame in which a seed-box, in form the frustum of a cone, revolves by means of a disk on its smaller base rolling on the ground. A hopper on the beam supplies the seed, which passes out between the larger base and a portion of the frame covering it, the outlet being adjusted by a screw on each side of the frame. There is a shovel in front, and also a coverer behind.

Claim.—1. The arrangement of the wheel I and distributing hopper or cylinder H M on the shaft J with relation to the apertured plate F, having the receiving-hopper G secured to its outer side, as shown and described, to operate as specified.

2. The combination of the two adjusting-screws O P with the plate F, the distributing-hopper H, wheel I, shaft J, and radial arms M, substantially as herein shown and described, and for the purpose set forth.

136,278.—*Lifting-Bridge.*—SAMUEL SWARTZ, Buffalo, N. Y.

The bridge rises on a horizontal shaft operated by a winch and toothed sector. It is counterpoised by a balance-beam and weight, the former being connected with the bridge, near the center of its length, by a link. The tension-rods underneath and the diagonal planking tend to stiffen the bridge and secure it against torsional strains.

Claim.—1. The horizontal pivot-shaft C with arms E E', the pivoted bridge D, the struts F F', the lifting mechanism K L M, and the balance-beam N with the counter-weight R, arranged, as described, to leave a clear tow-path, and combined and operating substantially as set forth.

2. The arrangement of pivot-shaft C, having arms E E', struts F *f* F' *f'*, and truss-pieces G G', substantially as described.

3. The provision, on the pivot-shaft of a draw-bridge, of the ratchet H *h* H', in the described combination with the catch-pawls I J J'.

136,279.—*Harvester.*—ZURIEL SWOPE, Lancaster, Pa.

The frame is arranged in front of and above the main axle, and is provided with a lead-wheel that is adjustable so that its direction may be changed to counteract the side draft.

Claim.—1. The frame A, bent and angular, as shown, with an upper and lower bar on each side, extending forward from and above the axle C, having wheel E, and connected together by the cross bars B B¹ B² B³, and provided with the shafts H d with wheels J, b, and G, all constructed and arranged substantially as and for the purposes herein set forth.

2 The combination of the guide-wheel N, shaft h with fork O, lever P with pin i lever R with jaw n and ratchet p, and the collar m, all substantially as and for the purposes herein set forth.

136,280.—*Crib Attachment for Bedsteads.*—MARY W. TARBELL and JOSEPH H. P. INSLEE, Jersey City, N. Y.

Framed to the uprights forming supports or legs, is the outside of the crib To the lower edge of it is hinged the bottom, and to the ends of the bottom the ends are hinged to fall on its bottom, which is constructed to drop down when not in use From the inner edge of the bottom hooks are appended, by which it may be attached to the bedstead, and all made to fold when not in use.

Claim.—The combination of the posts A, stationary side B, hinged bottom C, hooks D, hinged ends E e', and hooks F, with each other, in substantially the manner herein shown and described.

136,281.—*Lifting-Jack.*—SYLVESTER TAYLOR, Cold Water, Mich.

Claim.—The combination of the bars A, B B, and C C, notched bar D, and curved lever G, all constructed and arranged as described to form a lifting-jack, substantially as herein set forth.

136,282.—*Bobbin for Sewing-Machine Shuttles.*—WILLIAM H. THAYER, Somerville, assignor to ABNER J. TOWER, Boston, and OSBORNE M. SOUTHWICK, Somerville, Mass.

The auxiliary head is added to the main head, and a groove is left between them to receive the thread should it slip over the inner head, and thereby prevent the thread from being wound about the pivot.

Claim.—The sewing-machine shuttle bobbin, provided with the auxiliary heads, as described, arranged with the main heads, shank or body, and pivots, all substantially as specified.

136,283.—*Wash-Boiler.*—JOSEPH C. TILTON, Pittsburg, Pa.

A wash-boiler, constructed in ordinary form, with an adjusting false bottom, having openings for the passage of the water, over which is fitted a slide or valve covering the openings, and is held in position by staples arranged to give full play to the valve, and the bottom resting upon two projections connected with the sides with grooves, into which a projection attached to the bottom is fitted, and a close joint made by covering it with cloth that the water may be, by the aid of the steam, forced up and onto the clothes by side or end pipes with apertures on their top for the discharge of the water.

Claim.—The removable false bottom D having the turned-down edges covered with cloth rubber, or other suitable packing, secured substantially as described, in combination with the boiler G having the partial false bottom I I, grooves K K, and hot-water passages E E, when arranged and operating as described, and for the purpose specified.

136,284.—*Spring for Vehicles.*—THEODORE R. TIMBY, Tarrytown, N. Y.

Each end of the half-elliptic spring bears upon the surface of a triangular rocker, which is secured within a suitable case. Rubber cushions are interposed between the rocker and the side of the case, and a guiding-cap is secured to the top of the case, which keeps the spring in position laterally.

Claim.—1. The combination of the rocking blocks F and cushions or springs H, arranged to operate substantially as and for the purposes herein set forth.

2. The combined cap and guide G g, constructed and applied substantially as and for the purposes specified.

136,285.—*Cigar-Tip Cutter.*—FERDINAND TIMM and THEODOR FANTINI, Stapleton, N. Y.

A cutting-knife works between two plates, which have apertures of different sizes to suit various sizes of cigars.

Claim.—The arrangement of a cutting-knife, D, between two plates, a a, containing corresponding apertures b b of different diameters, placed above a suitable box or receptacle, A, for receiving or catching the cigar-cuttings, as and for the purpose described.

136,286.—*Motor.*—LUCIUS E. TRUESDELL, Warren, Mass.

The piston of the hydraulic engine is combined with a system of accelerating-gear, by means of which a portion of the power of the engine is converted into motion and made serviceable as a prime motor.

Claim.—1. The combination, substantially as described, of a series of accelerating-gears with the piston of a hydraulic engine, for the purpose set forth.

2. The combination of a piston carrying two rack-bars, a, with a driving-gear, b, operated in the manner and for the purpose set forth.

3. The combination, substantially as described, of a lever, K, and clasp connection L with the piston-rod D E of a pivoted hydraulic engine, B, for the purposes set forth.

4. The combination of the piston-rod studs M with the projection m of the lever K, for the purpose set forth.

136,287.—*Wagon for Hauling Stone or Heavy Bodies.*—LUCIUS E. TRUESDELL, Warren, Mass.

To facilitate the loading and unloading of large stone and other heavy bodies, and the moving of the same.

Claim.—1. The combination of the independent wagon-bed J with a wagon-frame, substantially as described, the whole operating in the manner and for the purposes set forth.

2. The combination of a movable or adjustable lifting-jack, Q, with a wagon frame, substantially as described, for the purposes set forth.

3. A wagon frame, consisting of a carriage-way, a, and a lower supporting-frame, A, and a system of standards, C, C¹, and C², substantially as described, and for the purpose set forth.

4 The combination of a pinion, A, and gear-wheel D with the main wheels F of a wagon, as arranged and operated, for the purpose specified.

136,288.—*Paint-Brush.*—PHILIP WAGNER, New York, N. Y.

The brush is fixed in a metallic cap with a suitable handle. Over this cap is an extension case to slide on the bristles, which is adjusted by a set-screw.

Claim.—The extension case D, held in place on case A by a screw, d, and applied to a brush, substantially as herein shown and described.

136,289.—*Shoe-Brush.*—GEORGE WALZ, Hoboken, N. Y.

A shoe-brush, constructed with a distributer on its back, connected with a lever and valve leading from a reservoir of liquid blacking, by which the operator, while using the brush by a pressure upon the lever, may furnish the distributer with blacking without the necessity of handling the box.

Claim.—The box F f', rubber tube G, valve C, lever D, plate E, springs I and I, and plate J, in combination with the polishing-brush A applying-brush B having its stock perforated, and handle K, substantially as herein shown and described.

136,290.—*Swinging Candlestick for Ships.*—JOSEPH J. WALTON and EDWARD A. BARRETT, New York, N. Y.

The curved part of the collar which holds the candle against the spring is divided by openings cut therein, thus allowing access of air to the base of the burning wick and removing a portion of the metal, which would communicate heat to the candle.

Claim.—The slots a a, in the curved part of the collar H, and used in connection with the tube C and spring and holder E G, all constructed substantially as and for the purpose specified.

136,291.—*Damper for Hot-Air Furnaces.*—AMOS C. WARREN, Concord, N. H.

By means of the slotted head of the actuating-rod, the adjustable pivot, and the rod which connects the lever with the damper-spindle, the damper within the air-conduit may be adjusted at any desired angle.

Claim.—1. The combination of the connecting-rod b, the lever D, the adjustable pivot r, the slotted head v, the screw w, and block s, such being for application to the diaphragm and the damper, in manner as shown and described.

2. The combination of the rod b, the lever D, adjustable pivot r, slotted head v, the screw w, and block s with the rod t, the diaphragm k, the case t, the pipe m, and the drum or cylinder F, all being constructed, arranged, and applied together, substantially as explained and shown.

136,292.—*Coffee-Roaster.*—ALFRED W. WETBURN, Minneapolis, Minn.

A plate, of diameter of ordinary pot-lids, having a longitudinal aperture in the center with standards at either end; the whole cast in one piece. The standards sustain a revolvable coffee-roaster in and over said aperture.

Claim.—A revolving coffee-roaster, in combination with a stove-lid having a central opening, in which the roaster can revolve, substantially as and for the purpose set forth.

136,293.—*Construction of Boots and Shoes.*—MORTIMER M. WHEELER, Galena, Ill., assignor of one-half his right to JAMES JONES, Dodgeville, Wis.

Claim.—1. The upper and a stiffening of a boot and shoe cut in one single piece, substantially as described, for the purpose specified.

2. The pattern for the upper of a boot or shoe, cut in the form shown in Fig. 2 of the drawing, with the piece cut from the opening B turned under to form a heel-stiffener, substantially as described, for the purpose specified.

136,294.—*Hand-Planter.*—GABRIEL WINDLE, New Cambria, Mo., assignor of one half his right to NORMAN N. DAVIS, same place.

The seed deposited in the main hopper is conveyed through an opening into a side chamber, thereby relieving the feeding-slide from the pressure of the grain. The working of the handle moves the short pivoted board and alternately opens the jaws which penetrate the earth, and the aperture in the slide, through which a regulated quantity of seed falls at each movement into the conducting-chamber and is deposited in the earth.

Claim.—1. The end b' of the short hinged board B, arranged to move beneath the feeding-slide E, and having the curved handle H A attached thereto below the feeding-slide E, as described, to obtain the advantages stated.

2. The short hinged side board B b', in combination with the curved handle H and steps G and A', as and for the purpose described.

136,295.—*Harvester.*—WILLIAM ARBON WOOD, Hoosick Falls, N. Y.

The lifting-lever is journaled on the main axle, and has attached to it a cam-arm to operate on the rear of the tongue, to vibrate the gear-frame. Said cam-arm also acts upon the lifting-chain, which is connected to a segment on the shoe, and at the opposite end to a fixed point on the frame, for the purpose of raising the finger-bar.

Claim.—1. The sheave or segment D² on the shoe D, in combination with the chain E extending horizontally or nearly so from said sheave, and attached to a fixed point on the frame, and operating substantially as described.

2. The lifting-lever H, provided with the cam-arm G² operating upon the rear extension of the tongue, for vibrating the frame and permitting the further movement of the lever independently of both frame and tongue, for raising the outer end of the cutting apparatus, substantially as described.

3. The cam G² applied to the lever H, in combination with the heel extension of the tongue and the lifting chain E, arranged and operating substantially as described

4. The seat support mounted loosely on the axle, and connected with the tongue by means of the link P, substantially as and for the purpose described.

136,296.—*Sink-Trap.*—NICHOLAS WRIGHT, New York, N. Y.

In a sink trap the inlet-pipe enters at a lower level than the mouth of the outlet-pipe. The water entering raises a lever-float hinged to the wall of the trap, the lever of which raises the flap-valve of the outlet-pipe, permitting the water to flow out. The falling of the float permits said valve to reclose the outlet, thus preventing the escape of offensive gases.

Claim.—The combination of the lever-float E F and valve D with the trap C, provided with a detachable cover, G, and with the inlet pipe A and outlet-pipe B, substantially as herein shown and described.

136,297.—*Cultivator.*—SINGLETON L. YOUNG, Scottsville, Ill.

The axle tree is in two parts; the inner ends of the upper sections are provided with a rack-segment, and the space between them is occupied by a pinion that gears into both racks. A lever, projecting rearward, is secured to the pinion, by means of which the machine is guided. The cultivator-beams are two in number, and are placed parallel to the lower section of the axle-tree and secured by adjustable drag-bars.

Claim.—1. The combination of the lever E having pinion D on the lower end, and the axle arms B B having racks on their inner ends, arranged on the axle-trees A of a wheel cultivator, as and for the purpose described.

2. The device B B D E, combined with the guide F pendent from the middle of the axle-tree, as and for the purpose set forth.

3. The draft-bars H and adjustable braces I, combined with axle pivoted to beam A, as and for the purpose specified.

136,298.—*Turbine Water-Wheel.*—JOSEPH N. ASBURY and LEONIDAS M. ASBURY, Rockland Mills, Ky.

Metallic flanges are secured to the offsets at the bottom of the blocks and above the wheel to prevent the escape of water between the blocks and wheel.

Claim.—The blocks B B holding the metallic flanges H H', in combination with the turbine wheel A, having the rim and hub grooved at a a', substantially as specified.

136,299.—*Deck Light.*—ISAAC M. BEARSE, Boston, Mass.

A hemispherical bull's-eye has upon its periphery a flange which fits in a a countersunk cavity in the deck, and is held in its place by a metallic ring above it, having ears or lugs by which said ring is secured—all for the purpose of compensating for the wearing away of the deck and the consequent chipping of the glass.

Claim.—The bull's-eye B with its flange C, in combination with the countersink m, seat e, and upper fastening-ring g, either with or without the washer f, all combined and arranged substantially as and for the purpose above described.

136,300.—*Lasting-Tool.*—LYMAN R. BLAKE, Brooklyn, N. Y.

A nail is severed from the blank at each downward movement of the plunger and drops into the tube in position to be driven. The nail-blank is fed forward by means of a lever and spur-wheels, which are actuated by the vertical movement of the holder.

Claim.—1. The combination, with the nail-socket e, head supporting and severing edge f and nail-tube g, of a driver, m, which, in conjunction with edge f, severs the nail-head, and then drives the nail.

2. In combination with the severing and driving mechanism, the straight arm b, with its T-shaped passage d for the blank, and the blank-feeding mechanism, all substantially as shown and described.

3. The spur-wheels o p, pawls q r, slide s, and lever u, operated and operating to intermittently move the blank forward, substantially as described.

4. The construction and arrangement of the mechanism, substantially as shown and described

136,301.—*Bolstead Fastening.*—LEWIS G. BRADFORD, Plymouth, Mass.

Upon the rail end of the joint-plate there are punched-out projections which fit in corresponding depressions in the rail.

Claim.—The joint-plate A, when the same is made with the projections B' C' D', substantially as described, and for the purpose set forth.

136,302.—*Food Compound.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

Desiccated maize and oats ground to suitable-sized granules.

Claim.—The new article composed of a mixture of desiccated and granulated maize and oats, as set forth.

136,303.—*Food Compound.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

Claim.—The new article of manufacture, consisting of barley and wheat granules mixed and desiccated, as set forth.

136,304.—*Food Compound.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

Oats and wheat are scoured and cleaned separately and desiccated. The oats are reduced to a fine meal. The wheat is reduced to a meal, preferably by revolving pulverizers.

Claim.—The food compound prepared of the materials and in substantially the manner specified.

136,305.—*Article of Food from Cereals.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

The cereal is cleaned, scoured, and reduced to a coarse flour; it is then mixed into a stiff dough and baked in a slow oven. The sheets or pieces of cooked cereals are broken or ground into a flour of the desired fineness.

Claim.—The meal or flour prepared by the process herein specified.

136,306.—*Preparing Corn-Meal for Shipment.*—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to CHARLES F. CHICHESTER, same place.

Maize scoured, dried, ground, and packed into tin cans or other similar packages by a pressure that is sufficient to compress the mass to about one-half its bulk.

Claim.—The desiccated and ground maize, reduced in bulk by pressure sufficient to expel most of the atmosphere, and inclosed in a tin or other package, as set forth, as a new article of manufacture.

136,307.—*Railroad-Rail Joint.*—WILLIAM B. CLARK, Thellertown, Pa.

Claim.—The tapered square keys C C with heads d, threaded end e, washer D, nut E, and square holes c c, in combination with the rail parts A and B, substantially as and for the purpose hereinbefore set forth.

136,308.—*Medical Compound or Ointment.*—MARY ANN CURTIS, San Francisco, Cal.

Leaf-tobacco, lard, red wine, beth-root or *Trillium pendulum*, resin, niter, bees-wax.

Claim.—A medical compound or ointment, consisting of the ingredients above enumerated, in the proportions specified, for the purposes described.

136,309.—*Hose-Nozzle.*—EDMUND A. DAY, Oberlin, Ohio.

Pivoted clamps are attached to a metallic nozzle for controlling the passage of fluid through the hose.

Claim.—In combination with the metallic nozzle A, the ears E and E, lever-handles C and D, bearings J and J, and intermediate elastic tube L, constructed and operating substantially as and for the purpose set forth.

136,310.—*Car and Window Washer.*—PATRICK S. DEVLAN, Jersey City, assignor to himself and WALTON BROTHERS, Newark, N. J.

A head with a stationary and a movable jaw hinged together, and mounted upon a handle. A sponge is contained between the jaws, and a lever on the movable jaw ejects the water from the sponge.

Claim.—The window and car washing apparatus, composed of the jaws b and c, hinged together and combined with the lever A and handle, substantially as and for the purpose set forth.

136,311.—*Shuttle for Sewing-Machines.*—GEORGE ARSEL EDWARDS and GEORGE SCHNEDER, Syracuse, N. Y.

The bobbin-supporting spindle is hinged to the shuttle-case and the spring, the pressure of which is governed by the nut, which presses the head of the bobbin into the annular depression.

Claim.—1. The shuttle provided with the pivoted screw-threaded spindle, thumb nut, and spring, and with the depression F, into which the head of the bobbin may be pressed by the spring and nut, as described.

2. The principle of a bobbin long and hollow to receive an axle. (See Fig. 4.)

3. The principle of such a bobbin running on a movable and adjustable axle.

4. The principles for adjusting and confining said axle and bobbin in their proper positions in the shuttle for operation.

5. The principles of the burred nut and coiled-wire spring in their several positions and offices, for obtaining any desired tension to the thread being reeled off of said bobbin; all of which principles are herein detailed and explained.

136,312.—*Manufacture of Plug and Bunch Tobacco.*—ISAAC EPINGER, New York, N. Y.

A cylindrical bunch or sheaf of the required length is wound with a rope of twisted or spun tobacco and then subjected to pressure in a die or press.

Claim.—1. The method herein described of putting up tobacco into packages or lumps, by coiling a rope of twisted or spun tobacco around a core or bunch of tobacco, the whole being subjected to pressure, substantially as herein described, and for the purposes set forth.

2. As a new article of manufacture, tobacco prepared and put up in packages or lumps, substantially in the manner and for the purposes herein set forth.

136,313.—*Street Letter-Box.*—CHARLES L. EVERT, Washington, D. C., and AGA JOHNSON, New York, N. Y.

A series of levers attached to the cover operate a pawl and ratchet which rotate a time-indicating wheel as the cover is raised to empty the box.

Claim.—The combination with a street letter-box of a register or indicator, operated by the opening or closing of the lid or door of the box, for the purposes herein set forth.

136,314.—*Sewing-Machine.*—OSCAR FARRAR, Chicago, Ill.

A bobbin of usual form is supported by the bobbin-case having a loop-check and perforations for producing tension, and both are confined in operative position with relation to the rotating hook by means of the ring-slide. When the loop of upper thread is caught by the check the case has a slight movement, thus allowing the check to yield to the action of and not unduly strain the loop, and at such time the bobbin is moved sufficiently to let off enough thread for the next stitch, but when the loop is cast off by the further rotation of the revolving hook the case is drawn back and the tension on the lower thread is momentarily increased. The recess in the case is to facilitate the passage of the loop of upper thread. The tension of the lower thread may be varied at will by means of the small holes in the case.

Claim.—1. The bobbin-case D, provided with the hook or check *r*, arranged to operate substantially as described.

2. The bobbin-case D, provided with the recess *e*, to facilitate the passage of the thread, as shown and described.

3. The bobbin-case D, provided with the spring *k*, having the lip *n* projecting through the case, substantially as shown and described.

4. The rotating hook B, having its recess to receive the bobbin arranged eccentrically substantially as and for the purpose described.

5. In a sewing-machine, a bobbin-case which is turned backward by the bobbin-thread, while said case is held under the pressure of the needle-thread, substantially as herein described.

6. The bobbin-case D, provided with the recess *e*, and with the hole or holes *f* in its upper side, as shown and described, and for the purpose set forth.

136,315.—*Air Repeating-Gun.*—PAUL GIFFARD, Paris, France.

The gun is a breech-loader, the breech-piece being rotated by a lever. The passage by which the air-chamber communicates with the barrel is controlled by a valve in the end of the air-chamber. The valve stem or spindle, passing through suitable guides, is struck by the hammer to open the valve. The sweep of the hammer is increased or diminished by an adjustable stop, and thus regulates the amount of air admitted to the barrel at each discharge.

Claim.—1. In combination with the barrel C provided with the partially-rotating breech-piece *e*, the air-cylinder A constructed and arranged relatively to the barrel, and the passage *k* and spindle *p* by means of which the air within the cylinder is discharged into the barrel substantially as described.

2. In combination with the barrel C and air-chamber A and its connecting mechanism, the inclined stop *r* to adjust the stroke of the hammer, substantially as described.

136,316.—*Compressed-Air Defense-Stick.*—PAUL GIFFARD, Paris, France.

A cane is formed of two parts, the air-reservoir and the barrel. In the air-reservoir is placed the pump. The valve communicating between the air-reservoir and barrel is controlled by a bolt operated by a small lever on the outside of the barrel.

Claim.—The herein-described defense-stick, consisting of the air-chamber A, with the air-pump B arranged therein to charge the said chamber, the barrel S with the opening *n* between the air-chamber and barrel provided with the valve I, and combined with the bolt L and lever L′, the whole constructed and arranged to operate substantially as set forth.

136,317.—*Machine for Lasting Boots and Shoes.*—CHARLES W. GLIDDEN, Lynn, Mass.

A rubber or flexible bag is secured to a rigid frame or receiver, constructed in form to receive a lasted boot or shoe. The bag is charged with water, and as the pressure increases the upper is forced firmly against the last, and the projecting edges are pressed over upon the inner sole, where they are held by a series of radially or laterally moving slides until secured by lasting-tacks.

Claim.—In combination with the flexible and elastic bag or bags, to be filled and expanded as described, a series of slide-plates, bars, or jaws for crimping and holding the edges of the upper, substantially as described.

136,318.—*Lasting-Tool.*—CHARLES W. G. IDDEN, Lynn, Mass.

The nails are arranged in a removable chute, provided with inclined ways, down which the nail-heads slide, and between which the nail-shanks pass, and from which they are transferred automatically to the nail-tube by means of a fork attached to an adjustable lever.

Claim.—1. In combination with the tack and driver tube, the inclined chute *g*, with its ways *f* and prongs *f*, substantially as described.

2. In combination with the tube *a* and chute *g*, the lever *r*, with its prongs *n*, the lever being operated to remove the tack from the chute and drop it into the tube *d*, substantially as described.

3. In combination with the tube *a*, a tack-chute, *g*, made removable, substantially as described.

136,319.—*Lead-Pencil.*—JOSHUA GRAY, Medford, Mass., assignor, by mesne assignments to GOODYEAR RUBBER-HEAD PENCIL COMPANY, New York City.

A piece of India rubber is attached to the pencil by means of a holder or cap.

Claim.—Combining with a pencil, by means substantially as specified, a piece of India rubber, or like material, whereby marks made by the pencil may be effaced, as set forth.

136,320.—*Corset.*—THOMAS F. HAMILTON, New Haven, Conn.

In addition to the packet in the fabric for receiving the main-spring there is a second packet to receive the auxiliary spring.

Claim.—In combination with the pocket of each steel proper, a second pocket formed within the pocket of each steel to receive an auxiliary steel or stay, substantially as specified.

136,321.—*Grinding-Mill.*—JAMES T. HARVEY, Murtysville, Pa.

An arrangement of unequal-sized grinding-rollers, running at different degrees of speed, covered with indented soft wrought-iron bands, easily redressed when required, in connection with a concave composed of suitable grinding-bars.

Claim.—1. The combination of the unequal-sized cylinders C^2 C^3 arranged to run at different degrees of speed, and the large indented revolving cylinder E and concave grinding-bars K, all constructed and arranged to operate substantially as specified.

2. In a grinding-mill, the improved grinding-cylinder, encircled by a band of soft wrought-iron indented, substantially as and for the purpose specified.

136,322.—*Machine for Burnishing the Soles of Boots and Shoes.*—GARDNER C. HAWKINS, Boston, Mass.

The operating-lever C′ is provided with a slot in which the pivoted end of the fulcrum-adjusting lever moves, controlling the length of stroke given to the burnishing-tool.

Claim.—1. The operating-lever C′, with its fulcrum-slot *e e* and sliding box G, in combination with the adjustable fulcrum *f* and the fulcrum-adjusting lever E E′, substantially as described, and for the purpose set forth.

2. In a burnishing-machine, the reciprocating burnisher D, when arranged in combination with the fork C and operating-lever C′, so that the length of its stroke may be adjusted by moving the fulcrum *f*, operating substantially as described, and for the purpose set forth.

136,323.—*Addressing-Machine.*—SIMEON HOLTON, Middlebury, Vt.

A printed strip is intermittingly fed forward by rollers, under a reservoir which descends to paste its surface. At the next feed it is moved over a fixed blade, and a label is severed by the descent of a vibrating blade.

Claim.—1. The pasting mechanism consisting of the cam E on the driving-shaft *a*, lever K, and paste-reservoir M with strainer *i*, all constructed and operating substantially as and for the purposes herein set forth.

2. The combination of the feeding device, consisting of crank G, shaft *a*, rob *b*, lever H, pawl *d*, spring *e*, wheel J, and rollers I I, the pasting mechanism consisting of cam E, lever *h*, reservoir *m*, and strainer *i*, and the cutting mechanism consisting of cam D, lever N, rod *m*, shaft O, lever P, spring *p*, and cutters *n s*, as and for the purpose herein set forth.

136,324.—*Sewing-Machine.*—JOHN T. JONES, Ilion, N. Y.

The spring-fingers project laterally from the pins on which the thread-guiding rollers turn, and prevent the thread from getting out of place, yet allow it to pass between them to the rollers and the controlling-lever, actuated by a cam on the upper shaft. The nut of the tension device is composed of two pieces held together by a split steel ring, thus enabling the nut to hold itself in any position on the screw.

Claim.—1. The spring-fingers *u v* of the rollers or guides *l n*, in combination with the controlling-lever *m*, operating as and for the purposes specified.

2. The arrangement of the stationary eye *o′*, tension device *h*, eye or groove *i*, guides or rollers *l n*, and take-up lever *m*, operated substantially as set forth, for controlling the tension and the slack thread, substantially as set forth.

3. The two-part nut *b′*, made with a neck that receives the contractile band 10, as and for the purposes set forth.

136,325.—*Harvester.*—JOHN F. KINGWILL, Chicago, Ill.

A stationary rack is placed over the tongue, into which the arm of the sliding fulcrum-rod engages for the purpose of obtaining any desired relation between the frame and tongue; said fulcrum-rod is operated by a hand-lever in reach of the driver.

Claim.—The combination of the rack *a*, rigidly-attached arm *c*, sliding rod *b*, spring *e*, and lever *g*, when applied substantially as and for the purposes specified.

136,326.—*Bottle-Stopper.*—FREDERICK KUTSCHER, New Haven, Conn.

An elastic bottle-stopper is attached to a covering-plate by a central hollow projection, which is expanded by inserting a ball, or equivalent. The stopper is expanded while being forced into the bottle by reason of the concavity of its upper extremity and the concavity of its lower part.

Claim.—1. In combination with the plate B, the plug E, constructed with the projection F to extend through the plate, and with a cavity in the said projection filled to expand the said projection, substantially as described.

2. The plug E, constructed of a convex form upon its upper surface, combined with the plate B, having a downward conical projection, substantially as and for the purpose specified.

3. In combination with the plate B, constructed with a downward conical projection, the plug E, constructed with a concavity upon its lower surface, substantially as and for the purpose set forth.

136,327.—*Oil-Cup Support for Sewing-Machines.*—LA ROGE N. LESLIE, Leominster, Mass.

A cast-metal bracket with a shelf, to be screwed under the machine-top, and a spring to hold the cup in place on the shelf.

Claim.—The oil-cup supporter consisting of the parts C B D, in combination with the spring E, arranged substantially as described, and for the purpose set forth.

136,328.—*Hose-Coupling.*—HOMER LEWIS, Bennington, Vt.

Employs, in connection with the tapering end of the coupling, an elastic ring with a central opening slightly smaller than the largest part of the tapering end, so that the pressure of water acts to drive the flexible ring upon the tapering end, and expand the same to tighten both the inner and outer edges of the ring. The flat side of the ring takes a bearing against a nearly-flat surface, in which is the joint between the two parts of the coupling. The two ferrules of the coupling are locked together by segmental lugs, and a spring lock is employed to keep the parts from turning and separating.

Claim.—1. The coupling cylinder *b*, with the tapering end *i* and bearing-surface 3, in combination with the elastic ring *d*, coupling-socket *c*, and bearing-surface 2, substantially as and for the purposes set forth.

2. The spring-catch *r*, in combination with the interlocking lugs of the respective parts of the coupling, the lugs *k* having notches *s* for such spring-catch *r*, as and for the purposes set forth.

136,329.—*Electro-Magnetic Motor for Printing-Telegraphs, &c.*—LANDY TUBSTALL LINDSEY, Jackson, Tenn.

Synchronism obtained in the operations of a series of electro-motors by making a gap in the circuit making and breaking wheel, stopping all the motors by breaking their circuits, which are restored by corrector-wheels closing the gap whenever such corrector-wheel of the slowest motor shall have arrived at the unison-point.

Claim.—1. In combination with the propelling set and the governor set of an electric motor, the wheel a^9, springs *a* a^1, and electrical connecting-wires therewith for controlling the motion of the governor set, substantially as herein set forth.

2. The combination of the springs *a u*, wheels *s e*, magnet M, lever L, adjusting-screws *i*, and electrical connecting-wires, all constructed and arranged as described, for the purpose of successively stopping the motors as they complete their revolutions, and starting them all at the same time by giving an additional impulse to the wheel a^9, substantially as herein set forth.

3. In combination with the devices claimed in foregoing clause, a type-wheel constructed to correspond in shape with the wheel *e*, for the purposes herein set forth.

4. The arrangement of the ratchet movement, as described, or an escape movement in lieu thereof, in combination with the shaft S and governing mechanism, for the purposes set forth.

136,330.—*Animal-Trap.*—ROBERT B. MAY, Murfreesborough, Tenn.

The bait-platform consists of a four wing fan having an auxiliary drop in its floor operated by the bait-latch and a pivoted drop opening toward and with said fan. The box underneath has a safe also provided with a pivoted drop-roof.

Claim.—1. The pivoted bait-hook E, connecting-rod *e*, pivoted board D, and sliding bolt C, combined and arranged substantially as specified.

2. The weighted pivoted platform F in combination with trap-door B, having the lugs *g*, the cord G^2, and rod G^1, substantially as specified.

3. The weighted tilting platform H, covering the compartment A in a trap having the radial-winged trap-door B and tilting platform F, substantially as specified.

136,331.—*Running-Gear for Vehicles.*—ISAAC O. MADDOWS, Bonham, Tex.

Claim.—1. The head block, provided with a central eye or opening for the passage of the axle tree, a groove for the reception of the king-bolt, with a loop or bracket in front and rear, as and for the purpose specified.

2. The friction-boxes, constructed in two parts and provided with a friction-wheel, F, metal bearing-surfaces or keys *d d′*, and secured by a metallic band or other suitable clamping devices, substantially as specified.

3. The head-block having brackets B B′, and the friction-boxes having loops *s s*, in combination with the tongue G and guide-braces *g g*, substantially as and for the purpose set forth.

4. The head-block with its bracket or loop B′, in combination with the coupling I, stay or brace *l*, and sand-bolster C, substantially as specified.

136,332.—*Prepared Lumber for Joiners' Use.*—JOHN MULLAY, Somerville, Mass.

Claim.—As a new article of manufacture, a strip or strips of lumber dressed to the proper width, thickness, and shape, in cross-section, for house finish and various other purposes, having their face, sides, and edges covered with paper, cloth, or other suitable thin flexible material secured thereto by means of paste, glue, or other adhesive material, with or without a coating of size, varnish, paint, or other protective substances impervious to moisture, substantially as described.

136,333.—*Stereoscope.*—PETER MURPHY, New York, N. Y.

The staff of a hand-stereoscope is divided and pivoted so as to allow of being folded up under the eye-piece when the handle is unscrewed and the guard or partition removed.

Claim.—The bar *a* and link *l*, hinged together and to the body *b*, in combination with the removable partition *n* and handle *n*, as and for the purposes set forth.

136,334.—*Mechanism for Transmitting Power.*—DAVID E. MYERS, Logansport, Ind.

The folding and expanding frames are connected with a rotating crank-shaft, which imparts motion to said frames, whereby the accumulated force is transmitted to some particular object.

Claim.—1. The improved machine for transmitting power, consisting of the jointed frame C D E F, connecting-bars G H, levers A^3 A^4, bar M, links *m* m^1 m^2 m^3 *n n′*, crank-shaft A, and connecting-rod *b*, constructed and combined substantially as specified.

2. The combination of the two power-frames, constructed and arranged as described, with the crank-shaft A, ways J, brace L or equivalent, and lifting-bar M, substantially as specified.

136,335.—*Washing-Machine.*—DENNIS J. OWEN and JAMES G. BRYDGES, Springville, Pa.

A washing-machine with a pounder in form of a bell attached to a center cylinder, to which are attached cross-sections with pipe, which are perforated on the bottom. The center pipe extending to the top has an enlarged addition, into which is fitted a valve for the free passage of air. On its bottom or near it is a receptacle for soap with openings for its discharge. To the working-bar a handle is connected, by which the pounder is moved to all parts of the tub.

Claim.—1. The bell-shaped vessel A with valve B, arranged as described, to form an air-pump washing-machine, substantially as herein set forth.

2. The central tube C, perforated at its lower end, forming the soap-cup, and provided with the perforated tubes E E, for the purposes herein set forth.

3. The combination of the bell-shaped vessel A with valve B, central tube C, and tubes E E, all constructed and arranged as and for the purposes herein set forth.

4. The post or brace G, provided with hook *b* and fastened to the tub by means of the griped link *d* and key *e*, substantially as herein set forth.

5. The rod A with ring *i*, arranged with the vessel A and handle I, substantially as and for the purposes herein set forth.

136,336.—*Shot-Cartridge.*—SETH W. PAINE, Rochester, N. Y.

Combinations claimed for confining and centering shot for a limited time and then releasing them, to obtain good results in shooting at long range.

Claim.—1. In combination with the shell of a longitudinally-divided cartridge case, a confining-cord wound spirally upon or around the periphery of the same, substantially as and for the purpose herein specified.

2. The sections A and A′, when constructed as shown and provided with the notches *a* and projections *a′*, substantially as and for the purpose set forth.

3. The apex B, constructed as shown, provided with the recesses *b*, and combined with the sections A and A′ provided with the lips *a″*, substantially as and for the purpose described.

136,337.—*Corn-Planter.*—DAVID PIERSON, JASON W. MACY, and JAMES D. MOORE, Grinnell, Iowa.

Connected by cross-framing and supporting the machine are, on each side, a furrower or runner, a double-shovel for covering, and a roller, as also a seed-box of two compartments formed by the runner passing into it. A slide reciprocates into both boxes by a lever, operated by the driver seated behind it.

Claim.—In a corn-planter frame, the scrapers C attached to the sides of the runner A, and forming the bottoms of compartments into which the seed-box is divided by said runner, all said parts being constructed and arranged as specified.

136,338.—*Machine for Dressing Brasses of Journal-Boxes.*—GELSTON SAFFORD, Stroudsburg, Pa.

The drift or cutting-tool is composed of a number of beveled disks clamped together on a rod, which, at one end, is screw-threaded and embraced by a nut, to which rotation is imparted by gearing. Adjustable clamping-jaws hold the brasses while being operated on, and a spool-like milling-tool, to which they are afterward presented, mills the corners of the brasses.

Claim.—1. The partially-tapering circular cutter, composed of a finishing-cutter, *c*, and bevel edged cutting-disks *d*, of successively diminishing diameter in immediate proximity to the finishing cutter, in combination with the longitudinally-sliding screw-threaded cutter-holder D, and the revolving nut or wheel H, substantially as specified.

2. The reversely-beveled finishing-cutter *c*, in combination with the reversely-beveled disks *d* on opposite sides of said cutter, and the longitudinally-sliding cutter-holder D, essentially as described.

3. The clamp K and brasses-holder J, in combination with the longitudinally-sliding tapering disk-built cutter, substantially as specified.

4. The combination of the brass-holding lever O with the reel-cutter P, having concave cutting extremities within its heads at either end, essentially as and for the purpose herein set forth.

136,339.—*Carpet Stretcher.*—NATHANIEL K. SHELTON, Wabash, Ind.

A wooden stretcher having a bifurcated beam-lever and a beam, both perforated to receive the fulcrum-pin, and having at their ends toothed heads provided with diagonal braces, mortised into said heads and said beams on each side thereof.

Claim.—The wooden carpet-stretcher described, consisting of the bifurcated beam-lever A and the beam A′, both perforated for the fulcrum-pin *b*, and having at their ends the toothed heads B′, provided with diagonal braces A, mortised into said heads and said beams on each side thereof, constructed and arranged as set forth.

136,340.—*Machine for Forming Staple-Seams in Leather.*—SAMUEL W. SHORET, Boston, assignor to AZRA B. KEITH, Braintree, Mass.

Mechanism is provided for feeding the wire the length required for a staple, and for severing, a movable anvil or former for bending it over, a plan or or driver for inserting the staple, and rotating nippers for twisting and turning the ends of the driven staple.

Claim.—1. The combination with the work-supporting plate, the mechanism for intermittently feeding the wire, the mechanism for cutting the wire into staple-forming lengths, the mechanism for bending each length into staple form, and the mechanism for driving the staples, as combined and arranged, and operating substantially as shown and described.

2. In combination with the wire feeding and presenting mechanism, the bifurcated foot *q* and rest or anvil *n* for bending the wire, substantially as described.

3. In combination with the bender-foot *q* and driver *s*, the inclined and retreating anvil *n*, operating substantially as described.

4. In combination with the work-plate *c* and the mechanism for driving the staple, the rotating nippers q^2, as arranged to twist the staple-points, substantially as described.

5. In combination with the twisting-nippers, the mechanism for actuating the nippers to trim off the points of the staples, substantially as shown and described.

6. In combination with the mechanism for feeding the work, driving the staple, and twisting the staple-points, the work plate having a downward movement previous to back movement of the swinging head, substantially as and for the purpose described.

136,341.—*Corn-Planter.*—JOSEPH D. SMITH, Muskegon, Mich.

The frame is in two parts. The forward part is made up of the runners, seed-box, and tongue; the rear part of the wheels, axle tree, and handle. The two parts are joined by a swivel-joint attached to the middle of the yoke that connects the runners, allowing a rocking motion between the parts. The tongue extends to the axle-tree, and is secured from lateral movement by guides. The seat is elongated fore and aft, and hinged at its middle to a standard upon the axle-tree, the forward end being coupled to the tongue. The driver, by shifting his position on the seat, can elevate the runners.

Claim.—In combination with a ball and socket or universal joint, for the purposes described, vertical guides attached to the axle, or some attachment of the axle of the wheel frame, between which the rear end of the tongue will work, and a movable pin passing through said guides to support that end of the tongue, all substantially as herein set forth.

136,342.—*Cotton-Seed Planter.*—LEWIS B. SUTTON, Windsor, N. C.

A cotton-seed planter, the rear end of which is supported by a strap passing around the operator's neck, the forward one being attached to a wheel. The seed pass down the trough into the furrow made by the opener and are covered by the roller.

Claim.—The receptacle A, trough B, bars C C, wheel D, opener E, coverer F $f f^1$, and hand H, all combined and arranged substantially as and for the purpose set forth.

136,343.—*Towing Canal-Boats.*—ISAAC P. TICE, New York, N. Y.

A traction-locomotive on a tow-path has a flexible steam-connection with the steam-boiler on the canal-boat, which connection or tube is made strong enough to be used as a tow-line. Weight of traction-engine is adjustable by means of water in tank under it.

Claim.—1. The combination of a traction-engine on shore or outside of the boat or vessel to be towed, a steam-boiler or its equivalent arranged on or in the boat, and a flexible pipe or tube operating as a tow-line, and connecting the boiler with the engine, and serving to convey the propelling medium or gases from the boiler to the engine, substantially as specified.

2. A traction engine adapted to receive ballast for insuring adequate traction according to variable loads, and discharging the same to insure lightness and portability, substantially as described.

3. The combination of an auxiliary tow-line, I, with the hollow tow-line H, substantially as and for the purpose described.

136,344.—*Steam Vacuum-Pump.*—ISAAC P. TICE, New York, N. Y.

A hollow cylindrical valve of a steam vacuum-pump admits steam to the water-chamber, being opened by the steam from the boiler and its own weight, and closed by atmospheric pressure. A perforated coil in the top of chamber connects by a branch pipe to the main-outlet pipe, and a cut-off pipe, with a scroll outlet near the bottom of the chamber, condenses the steam.

Claim.—1. In an apparatus of the character herein described, a valve constructed and arranged relatively to the chamber and connected substantially as herein described, whereby, on the completion of the discharge of the chamber, the valve is closed by the pressure of the atmosphere, and reopened by its own weight and the pressure of steam.

2. The combination of the vertically-sliding valve I, its cylinder F, perforated at one end for the admission of the atmosphere, steam-pipe J, and pipes H and G, substantially as and for the purpose herein set forth.

3. The cut-off pipe M, in combination with the vessel B, and the main-outlet pipe E, and the perforated coil or condensing-pipe L, substantially as described, for operation as set forth.

4. The combination of the scroll N with the cut-off pipe M, as shown and described.

136,345.—*Soda-Water Apparatus.*—JAMES W. TUFTS, Medford, Mass.

The surface in the cooling-chamber, between the two charged cylinders, is utilized by making in the connecting-pipe a series of vertical bends, thus obtaining a greater length of pipe, and consequently a larger cooling-surface.

Claim.—In combination with the syrup-cans, ice-chamber, and cylinders, all arranged substantially as described, the connecting-pipe, made in the form of a series of vertical bends, *l*, located between the cylinders, substantially as shown and described.

136,346.—*Revolving Snow-Plow.*—WILLIAM H. VAN GIESON, Whitewater, Wis.

An inclosed inclined plane, its cubical capacity increasing from the mouth to the side-openings, through which the snow is ejected upon the sides of the track; double-flanged shoes support its forward part, and prevent the plow from being forced from the track by lateral pressure; an adjustable guard-plate is provided that the downward pressure may be equalized by the snow striking the plate, and tending to hold the plow in a horizontal position.

Claim.—1. The inclosed inclined planes A A, gradually enlarging in every direction from front to rear, with the rearwardly and outwardly curving pieces B B, substantially as and for the purposes herein set forth and described.

2. The horizontally inclined and curved plate D, adjustable on top of the inclined tubes A A, acting as an equalising-pressure plate, and projecting any desired distance beyond the said inclined tubes.

3. The mouths H H of the inclined tubes A A, shaped substantially as shown and described.

4. The outwardly and upwardly curving supporting-shoes or guards E E with or without rollers, substantially as and for the purposes herein described and shown.

5. So constructing the inclosed inclined planes A A that the lower lines of the discharging-orifices thereof will be higher than the upper lines of the receiving-orifices.

6. The combination of the inclosed inclined planes A A, the curving pieces B B, the front portion F, the curved pressure-plate D, the mouths H H, and the supporting-shoes E E, each and all constructed as shown, and operating in the manner and for the purposes set forth and described.

136,347.—*Fork and Grain-Rake.*—MARCUS M. WALLS, Hartwick, N. Y.

The tines are strongly curved and attached to two bars which form the head. The handle is also strongly curved, and secured to the head in either position, as regards the curves, in one forming a rake and in the other a fork.

Claim.—The reversible handle C, having attached to its convex side the bent lug D, secured in reversed positions to the bars A A', substantially in the manner as specified, and for the purpose set forth.

136,348.—*Revolving Fire-Arm.*—DANIEL B. WESSON, Springfield, Mass.

The combination, in a revolving fire-arm, of the frame and brush or recoil-plate, when made in two parts and pivoted together, a hinged barrel, and an extractor, operated through the medium of the hinge-joint.

Claim.—The two parts A and A', hinged or jointed together, whereby the recoil-plate o may be turned away from the rear of the cylinder, in combination with the joint C, provided with the toothed piece *l* and the extractor *m*, substantially as set forth.

136,349.—*Chuck.*—JOHN H. WESTCOTT, Oneida, N. Y.

The back of each dog is screw-threaded to fit over a screw having its bearings in radial slides or boxes, beneath which a scroll-plate is situated. The dogs and boxes are guided and retained by means of side ribs or grooves. By means of this construction an independent adjustment of each dog can be made by turning the screw beneath it; and a universal movement of all the dogs by turning the scroll-plate, which, acting on the boxes, carries both dogs and boxes toward the center.

Claim.—The combination of the screws F, the radial sliding boxes E, and dogs B with the face-plate A and scroll-ring C, or its equivalent, substantially as and for the purposes herein set forth.

136,350.—*Pipe-Wrench.*—TURNER WILLIAMS, Providence, R. I.

A loose sliding jaw is operated by a pawl attached to one of the handles, and engaging in notches on the back of said jaw.

Claim.—The combination, in a pipe-wrench, of the jaw G and the pawl F, operating substantially as described, and for the purpose set forth.

136,351.—*Self-Adjusting Pipe-Wrench.*—TURNER WILLIAMS, Providence, R. I.

One stationary jaw is attached to the handle, and one jaw pivoted eccentrically and operated and controlled by a tumbler and spring.

Claim.—The combination of the jaw D, the block or tumbler E, and spring F with the fixed jaw B, operating substantially as described, and for the purpose set forth.

136,352.—*Machine for Patching Bullets.*—STEPHEN W. WOOD, Cornwall, N. Y.

A machine consisting of combinations claimed, by which a paper patch is wound around a bullet, folded over the rear end thereof, and then moistened; also, the combination, with such machine, of means for applying glutinous substances to either the strip of paper or the bullet.

Claim.—1. Combined with rollers for wrapping a patch around a bullet, substantially in the manner herein set forth, folding-jaws for automatically folding, gathering, or closing the patch over or around the end of the bullet, in the manner described.

2. The method, substantially as shown and described, of first patching or wrapping a patch around a bullet by mechanism, as herein set forth, and subsequently moistening the same, substantially as and for the purpose herein specified.

3. The combination of parts herein shown and described for patching a bullet, with mechanism for moistening or partially moistening with water or any glutinous substance the patch or bullet, substantially as and for the purpose herein specified.

4. A series of rollers for patching bullets, which are movable and adjustable, constructed and combined for operation substantially as herein set forth.

5. A series of sectional rollers, adapted for receiving the additional devices shown for patching bullets, substantially as and for the purpose herein specified.

6. A guide, in combination with a series of rollers for directing the patch around the bullet, constructed and arranged substantially as herein described.

136,353.—*Securing Lock-Spindles in Safe-Doors.*—RICHARD YOUNG, San Francisco, Cal.

The lock-spindle is secured in the safe door by means of one or more sliding bolts arranged within the body of the door which engage in an annular groove in the spindle.

Claim.—The sliding bolt or bolts *d*, in combination with the set-screws *g* and annular groove *f* in the spindle, when applied in the body of the safe-door, substantially as and for the purpose specified.

REISSUE PATENTS.

5,293.—*Egg-Carrier.*—ANNER H. BRYANT, New York, N. Y.—Patent No. 120,313, dated July 16, 1872.

Strips of pasteboard or other suitable material are cut and fitted together, producing tapering pockets, having elastic walls, adapted to hold and keep apart eggs during transportation.

Claim.—1. In an egg carrier or tray, the stripe A having the slits *a* cut in pairs in their upper edges, in combination with the stripe B having the slits *c* cut in pairs in their lower edges, the slits of each pair in each strip being separated by tongues *b* and *d*, respectively, substantially as specified.

2. The longitudinal and transverse interlacing stripe having the pairs of intersection slits extending from their upper and lower edges, respectively, downward and upward to about the same line, substantially as specified.

5,294.—*Wrench.*—THE COLLINS COMPANY, Collinsville, Conn., assignee of LUCIUS JORDAN and LEANDER E. SMITH.—Patent No. 50,364, dated October 10, 1865; reissue No. 3,652, dated February 22, 1870.

The end-thrust or back-pressure is transmitted by the step to the wrench-bar. A nut supports the step in close contact, thereby effectually relieving the handle from the end-thrust.

Claim.—1. The step, combined with the wrench-bar and supported by the nut F, or its equivalent, at the place where the step is connected with the bar, in such manner that the step can be removed from the bar without cutting or abrasion of parts.

2. The nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth.

3. The nut F, combined with the threaded bar, and performing the office of supporting the step, and also of rigidly fastening it to the bar, for the purpose set forth.

5,295.—*Flier for Roving and Spinning Frames.*—THOMAS MAYOR, Providence, R. I.—Patent No. 110,260, dated December 20, 1870.

By locating the friction-point in the position claimed the roving between it and the delivery-rolls is maintained more nearly in a line coincident with the axis of the flier-neck, its wabbling prevented, and a smoother and more even product obtained.

Claim.—That improvement in the construction of fliers which consists in the combination of the hollow tube A, or its equivalent, formed through the whole length of the axis of the neck of the flier, a friction-surface, *a*, located at or near the junction of the bows B B with the flier's neck, and the side-delivery tube *b* in one of the bows, substantially as described.

5,296.—*Hydraulic Telescopic Platform-Elevator.*—JUDAH PARKER and ISAAC COOK, San Francisco, Cal.; said PARKER assignor of one-half of his interest to SAMUEL P. TAYLOR.—Patent No. 129,421, dated July 16, 1872; antedated July 11, 1872.

A series of cylindrical sections, fitting one within the other so that when water is introduced at its lower end an air-chamber is formed, which acts on the top of the column of water concurrent with the pressure from the point of introduction, which forces the water through a pipe at the top of the tower, and to which is connected a hose so that water can be carried into or upon a building.

Claim.—1. A hydraulic sectional elevator adapted to discharge water at the top, substantially as described.

2. In combination with the air-chamber in the section D', the pipe J', as and for the purpose set forth and shown.

3. The described elevator, having the sections D, hollow upper section D', and discharge-tube J', as described.

4. In combination with the sectional tower, as shown, the locking devices L L, substantially as herein described.

5. In combination with the sectional tower, as described, the adjustable platform F and the extension-bridge I, substantially as herein described.

5,297.—*Riveting-Tool.*—BENJAMIN F. COBB, West Troy, N. Y., assignor to EBENEZER PRESCOTT.—Patent No. 115,821, dated June 13, 1871.

The end of an arbor or rotatable stock is slotted, and within this slot are two equal-sized disks supported loosely but close together on a transverse axle, and having jointly a concave periphery. Constant pressure of the double disk, edgewise against the end of a bolt and simultaneous rotation of the stock forces the metal outward gradually and equally in all directions laterally.

Claim.—1. Two equal-sized contiguous rollers, B C, hung upon the same pin, and arranged to be applied against the ends of the pins or bolts under a twofold rotation, for the purpose and in the manner specified.

2. The two rollers B C, having their contiguous faces notched to give room for the escape of particles that may be rubbed off the pins or bolts.

5,298.—*Manufacture of Car-Wheels.*—WILLIAM G. HAMILTON, Ramapo, N. Y., assignor to THE HAMILTON STEELED-WHEEL COMPANY.—Patent No. 85,069, dated December 22, 1868.

Claim.—As an improvement in the art of manufacturing cast chilled wheels for railroads, making such wheels from a compound of iron and steel or steely metals, substantially as described.

5,299.—*Traveling-Bag.*—ALBERT SONNEKALB and JOHN W. LIEB, Newark, N. J.; said SONNEKALB assignor to said LIEB.—Patent No. 52,902, dated February 27, 1866.

The body of the traveling-bag is attached to a box-frame by inserting a wire in the hem of the body and then clasping this wired edge in grooves or lips on the frame.

Claim.—1. A jaw or frame for carpet-bags having a groove or lips formed therein or attached thereto for receiving and holding the cloth or other material which constitutes the body of the bag, substantially as described.

2. The clips attached to the jaws for the purpose of securing the body of the bag thereto, substantially as described.

3. A carpet bag body with a fold or loop along the edge of the fabric or material where it is to be attached to the frame or jaws, substantially as described.

4. The combination of the jaws provided with a groove or lips, the looped cloth or other material, and the rod *a*, or its equivalent, substantially as described.

5,300.—*Egg-Carrier.*—WILLIAM D. TABER, Buffalo, N. Y., assignor of one-half interest to PHILIP P. JOSEY and EDWARD STRIEBER.—Patent No. 132,937, dated November 12, 1872; antedated November 9, 1872.

The egg-pockets are hexagonal in form, the side stripe being so interwoven as to leave a space unoccupied between the pockets. Half-pockets are formed above and below a diaphragm, so that each tray contains the upper half of one series and the lower half of the next series above.

Claim.—1. Pockets for egg-carriers of a hexagonal form, when made by means of cross-stripe, as described.

2. The diaphragm D, when combined with the series of half-pockets forming a tray with upper and under pockets, substantially as described.

3. A tray, composed of a series of upper and under half-pockets separated by the diaphragm D or its equivalent.

5,301.—*Manufacture of Leather.*—CHARLES J. TIMMERHOLM, Quincy, Ill., assignor to JOHN C. WHITE.—Patent No. 123,748, dated February 13, 1872.

Lime, sal soda, chloride of ammonium, and water in the depilating process; brimstone, potash, sal soda, chloride of ammonium, and water in the baiting process; gas-ammonia or gas-water when used in the manufacture of leather.

Claim.—1. The process of liming hides or skins by means of the combination and use of lime, sal soda, chloride of ammonium, and water, in the manner substantially as herein specified.

2. The process of baiting hides or skins by means of the combination and use of brimstone, potash, water, sal soda, and chloride of ammonium, in the manner substantially as herein set forth.

3. The manufacture of leather by means of the several successive processes of liming, baiting, tanning, and whiting, employing the ingredients and used in the relations substantially as described and stated.

4. Gas-ammonia or gas-water, when used in the manufacture of leather.

5. Chloride of ammonia, when used in the process of liming hides.

6. Combination of brimstone and potash in process of baiting hides.

INDEX OF INVENTIONS PATENTED FEBRUARY 25, 1873.

[The numbers in parentheses denote the classification of patents.]

Addressing machine, (146,) S. Holton	136,323
Air defense stick, compressed, (53,) P. Gifford	136,316
Alarm, burglar, (24,) H. L. Brower	136,310
Auger, hollow, (32,) C. W. Corr	136,138
Bag, traveling, (162,) Sonnekalb and Lieb, (reissue)	5,299
Barrel, (46,) H. Willard	136,196
Bath, swimming, (8,) P. Bralley	136,139
Bed bottom, (62,) P. C. Hard	136,158
Bedstead fastening, (62,) L. G. Bradford	136,301
Bedstead, sofa, (62,) J. K. Stockton	136,276
Bedsteads, crib attachment for, (62,) Tarbell and Insley	136,280
Billiard light, (64,) W. St. Martin	136,275
Boiler, steam, (148,) E. R. Cole	136,214
Boiler, wash, (91,) M. McP. Beard	136,12

Boiler, wash, (91,) J. C. Tilton 136,263
Boilers, preventing corrosion of stay bolts in steam, (148,) J. Cochrane 136,213
Bolts, die for making clips for king, (60,) A. Dillenbeck 136,143
Boot and shoe heeling machine, (16,) C. W. Glidden 136,233
Boot and shoe soles, machine for burnishing, (16,) G. C. Hawkins 136,322
Boots and shoes, construction of, (16,) M. M. Wheeler 136,293
Boots and shoes, machine for lasting, (16,) C. W. Glidden 136,317
Bosom, collar, &c., (38,) A. Johnson 136,247
Bottle stopper, (1,) F. Kutscher 136,326
Box for asserting peaches, (63,) E. W. Lockwood 136,252
Bridge, (21,) H. Pettit 136,177
Bridge, lifting, (21,) S. Swarts 136,278
Broom, (22,) S. Standish 136,273
Brush, paint, (22,) P. Wagner 136,286
Brush, shoe, (22,) G. Wale 136,289
Bucket, (40,) J. V. Denell 136,140
Buckle fastening, (23,) F. H. Gladding 136,151
Bullets, machine for patching, (32,) S. W. Wood 136,339
Bustle, (90,) M. K. Bortree 136,127
Canal boats, towing, (139,) I. P. Tice 136,343
Candlestick, (99,) C. H. Doughty 136,223
Candlestick for ships, swinging, (91,) Walton and Barrett 136,290
Cans, machine for holding and soldering, (136,) J. Redheffer 136,265
Car coupling, (122,) M. C. Doubleday 136,222
Car coupling, (122,) J. Growdon 136,237
Car coupling, (122,) T. N. Pengelly 136,176
Car truck, railway, (122,) M. H. Kolleck 136,248
Car and window washer, (22,) P. S. Devlan 136,310
Car wheels, manufacture of, (122,) W. G. Hamilton, (reissue) 5,298
Cars, water tank for railway stock, (120,) J. B. Calkins 136,132
Carburetor, (37,) W. H. Elston 136,228
Carpet stretcher, (62,) N. K. Shelton 136,339
Carriages, king bolt for, (31,) J. L. Mosier 136,255
Cartridge, metallic, (32,) B. Burton 136,130
Cartridge, metallic, (32,) I. M. Milbank 136,168
Cartridge, shot, (32,) S. W. Paine 136,336
Cartridge retractor for revolving fire arms, (123,) W. Clews 136,134
Cereals, feed from, (58,) L. S. Chichester 136,305
Charcoal used in rectifying spirits, revivifying, (47,) C. L. Fleischmann 136,147
Charcoal used in rectifying spirits, revivifying, (47,) A. Ernst 136,229
Check rein, elastic, (72,) Nealey and Kemp 136,256
Chimney top, (4,) J. Gorton 136,234
Chuck, (100,) J. H. Westcott 136,349
Churn, rotary, (45,) B. Eason 136,226
Cigar tip cutter, (160,) Timm and Fantini 136,285
Clamp, joiner's, (99,) Goodchild and Hay 136,152
Coffee roaster, (154,) A. W. Weyburn 136,292
Compound for expelling flies from rooms, (98,) J. Baqnol 136,203
Cooler, milk, (45,) S. F. Cowles 136,215
Corn husker, hand, (56,) H. L. Hall 136,157
Corn husking implement, (56,) O. J. Warren 136,194
Corn meal for shipment, preparing, (58,) L. S. Chichester 136,306
Corset, (60,) T. F. Hamilton 136,330
Cotton openers, &c., feed mechanism for, (28,) W. Noton 136,173
Cultivator, (43,) H. K. Krieble 136,249
Cultivator, (43,) K. McKinnon 136,254
Cultivator, (43,) S. L. Young 136,297
Cultivator, hand, (63,) L. J. Dawdy 136,220
Curtain fixture, (68,) W. A. Wheeldon 136,195
Cylinder cock, (156,) D. B. Dennison 136,221
Deck light, (137,) L. M. Bearse 136,299
Distilling together spirits of turpentine and alcoholic liquids, (47,) W. Corfield 136,137
Dough, machine for mixing and kneading, (4,) E. Edwards 136,144
Dovetailing machine, (173,) F. D. Green 136,236
Dredger, (62,) T. Symonds 136,167
Drill, grain, (133,) C. E. Patrio 136,260
Egg carrier, (116,) A. H. Bryant, (reissue) 5,293
Egg carrier, (116,) W. D. Taber, (reissue) 5,300
Elevator, hydraulic telescopic platform, (79,) Parker and Cook, (reissue) 5,296
Engine, air, (12,) Norman and Dietrich 136,259
Engine, rotary steam, (150,) C. Inman 136,164
Engine, vapor, (2,) J. F. Haskins 136,241
Fats, offal, &c., rendering apparatus for, (26,) A. Broadnax 136,129
Fence, portable, (52,) H. M. Dake 136,217
Fertiliser, (133,) J. W. Stubbs 136,277
Fire arms, revolving, (123,) D. B. Wesson 136,348
Fire arms, cartridge retractor for revolving, (123,) W. Clews 136,134
Food, article of, (58,) L. S. and M. G. Johnson 136,163
Food compound, (58,) L. S. Chichester 136,302
Food compound, (58,) L. S. Chichester 136,303
Food compound, (58,) L. S. Chichester 136,304
Fork and grain rake, (74,) M. M. Wells 136,347
Fuel, manufacture of, (61,) M. Rae 136,263
Furnace for chlorodizing ores, (99,) L. M. Phelps 136,261
Furnaces, damper for hot air, (154,) A. C. Warren 136,291
Game board, (143,) J. C. Arms 136,200
Gate, adjustable hinged, (58,) E. M. George 136,149
Gun sight (53,) M. W. Harrington 136,159
Gun, air repeating, (55,) P. Giffard 136,315
Hammer, blacksmith's, (60,) G. R. Cubberley 136,139
Hammer, power, (60,) J. M. Long 136,253
Harness pad, (76,) Groff and Wilson 136,155
Harrow, revolving, (73,) H. Mittendorf 136,169
Harrow, sulky, (73,) W. C. Bye 136,131
Harvester, (74,) J. P. Kingwill 136,325
Harvester, (74,) Z Swope 136,279
Harvester, (74,) W. A. Wood 136,295
Harvester cutter, (74,) Reed and Thompson 136,266
Harvester knives, machine for grinding, (74,) J. Murphy 136,171
Hatchway guard (79,) M. J. Hinden 136,161
Hinge, safe door, (199,) J. L. Hall 136,239
Hoisting apparatus, (79,) C. Clark 136,212
Hoisting machines, windlass for, (79,) J. Rushworth 136,270
Hose coupling, (81,) H. Lewis 136,328
Hose nozzle, (167,) E. A. Day 136,309
Indicator, railroad train, (121,) S. W. Hemenway 136,242
Insects, &c., compound for destroying, (98,) E. B. Sears 136,165
Inkstand filler, (1,) M. C. Stebbins 136,166
Insulator for battery cups, (50,) J. H. Thomas 136,191
Iron, smoothing, (91,) L. L. Mivelar 136,170
Iron, machine for corrugating sheet, (125,) A. and J. Reese 136,267
Jack, lifting, (79,) S. Taylor 136,281
Jacks, trammel for lifting, (79,) E. H. Hake 136,156
Jar, fruit, (58,) H. C. Gaskill 136,148
Jar, fruit, (58,) E. G. Haller 136,240
Journal box, (87,) S. Aland 136,198
Journal boxes, machine for dressing brasses of, (100,) G. Sanford 136,338
Knife polisher, (44,) Tarbie and Sawyer 136,188
Knitting machine needle, (89,) Platt and Stanbery 136,262
Labeling machine, (117,) C. W. Greene 136,154
Lantern, (90,) T. A. Devlee 136,218
Lantern, magic, (157,) P. Diehl 136,142
Lard, treating offal, &c., apparatus for rendering, (26,) J. N. B. Bond 136,208
Lasting tool, (16,) L. R. Blake 136,300
Lasting tool, (16,) C. W. Glidden 136,318
Latch, knob, (93,) J. M. A. Dew 136,141
Latch for gates, &c., (93,) C. Roberts 136,181
Lath machine, (174,) S. B. Bittenhouse 136,182
Lead, machine for making sheet, (125,) D. G. Batchelder 136,124
Leather, manufacture of, (92,) C. J. Tunnerholm, (reissue) 5,301
Leather, machine for forming staple seams in, (16,) S. W. Shorey 136,310
Letter box, street, (146,) Evert and Johnson 136,313
Logs, device for rolling, (130,) T. Emery 136,145
Loom, (95,) Canis and Higgins 136,133
Lumber for joiner's use, preparing, (30,) J. Mullay 136,332
Manger, automatic, (144,) D. A. Townsend 136,192
Mattress frame, wire, (62,) J. G. Smith 136,271
Mattress frame, woven wire, (62,) D. J. Powers 136,180
Medical compound, (35,) M. A. Curtis 136,308
Metal, anti-friction, (32,) G. S. Hunt 136,163
Milk, apparatus for cooling and transporting, (58,) E. D. Gird 136,150
Mill, grinding, (57,) J. T. Harvey 136,321
Motor, (92,) L. E. Truesdell 136,286
Nail plates, mechanism for feed, (103,) R. C. Grant 136,235
Napkin holder and clasp, child's table, (88,) D. Essex 136,146
Nut, adjustable, (14,) J. Russell 136,184
Paper boxes, machine for making, (109,) G. L. Jaeger 136,246
Parer, corer, &c., apple, (62,) G. W. Bennett 136,205
Pencil, lead, (146,) J. Gray 136,319
Planing clapboards, machine for, (173,) J. Atkins 136,201
Planter, corn, (133,) Pierson, Macy and Moore 136,337
Planter, corn, (133,) J. D. Smith 136,341
Planter, cotton seed, (133,) L. B. Sutton 136,349
Planter, hand, (133,) G. Windle 136,294
Planter, seed, (133,) R. Friday 136,231
Plow, (114,) Hunter and Mitchell 136,245
Plow, (114,) J. R. Nichols 136,257
Plow wheel, (114,) M. Potter 136,179
Power, mechanism for transmitting, (67,) D. E. Myers 136,334
Privy indicator, (*,) W. C. Duffield 136,224
Pruning shears, (63,) T. Borden 136,209
Pump, (118,) Norman and Dietrich 136,258
Pump, steam vacuum, (118,) L. P. Tice 136,344
Pump and funnel, combined atmospheric exhaust, (12,) G. H. Randall 136,264
Punching machine, (119,) S. W. Murray 136,172
Rail joint, railroad, (120,) W. R. Clark 136,307
Railroad crossing, (120,) G. Elliott 136,227
Railroad switch, (120,) H. Black 136,126
Railway snow plow, (120,) P. A. Smith 136,272
Railway snow plow, (120,) W. H. Van Gieson 136,346
Rake shoe, revolving, (77,) A. J. Taylor 136,189
Riveting tool, (119,) B. F. Cobb, (reissue) 5,297
Ruler and pencil sharpener combined, (146,) W. H. Flanigan 136,230
Saddle tree, gig, (72,) J. Bauer 136,285
Safe doors, securing lock spindles in, (93,) R. Young 136,351
Sash fastener and tightener (24,) T. Frost 136,232
Sewing machine, (134,) H. A. Currest 136,216
Screw cutting machine, (14,) J. W. Row 136,269
Screws, die stock for cutting, (14,) J. J. Grant 136,153
Scroll saw, (130,) H. Bickford 136,297
Seeder, broadcast, (133,) Orborn and Kendrick 136,174
Sewing machine, (134,) O. Farrar 136,314
Sewing machine (134,) J. T. Jones 136,324
Sewing machines, ruffler for, (134,) Hugg and Stewart 136,162
Sewing machine shuttles, bobbin for, (124,) W. R. Thayer 5,292
Sewing machines, shuttle for, (134,) Edwards and Schieder 136,311
Sewing machines, oil cup support for, (62,) L. R. N. Leslie 136,327
Spinning frames, flyer for roving and, (142,) T. Mayor, (reissue) 5,295
Soda water apparatus, (1,) J. W. Tufts 136,345
Steam pressure regulator, (149,) A. J. Ballard 136,204
Stereoscope, (157,) P. Murphy 136,333
Stereotype block holder, (164,) M. J. Hughes 136,244
Stereotype plates, machine for planing, (164,) H. Barth 136,194
Stone, composition for artificial, (153,) W. Hedley 136,160
Stool, &c., safety, (31,) A. Kent 136,166
Swing, (143,) J. F. Quigg 136,181
Table, &c., extension, (64,) A. Hersog 136,243
Table, &c., folding, (62,) T. P. I. Magoun 136,167
Table cushion, billiard, (143,) G. E. Phelan 136,178
Table tops, machine for making extension, (62,) R. G. Utley 136,193
Telegraph repeater, (50,) L. T. Lindsey 136,251
Telegraph instrument, duplex, (50,) J. B. Stearns 136,274
Telegraphs, transmitter for printing, (50,) L. T. Lindsey 136,250
Telegraphs, &c., electro-magnetic motor for, (50,) L. T. Lindsey 136,329
Tenoning machine, (173,) M. Buck 136,211
Thrashers, rewinnowing attachment for, (150,) J. B. Peden 136,175
Thrashing machine, (150,) C. S. Hall 136,236
Tobacco, manufacture of plug and bunch, (160,) I. Eppinger 136,312
Tobacco, apparatus for pressing and packing, (160,) Earickson and Harris 136,225
Trap, animal, (143,) R. B. May 136,330
Trap, sink, (8,) N. Wright 136,296
Umbrella ribs, steel strips, &c., apparatus for tempering, (85,) A. Wilson 136,197
Valve lubricator, (87,) J. Cochrane 136,136
Vehicle spring, (31,) T. R. Timby 136,284
Vehicles, running gear for, (31,) I. O. Meddows 136,331
Wagon seat, (31,) J. G. and J. S. Armstrong 136,123
Wagon body and seat, (31,) P. S. Rich 136,269
Wagon for hauling stone or heavy bodies, (31,) L. E. Truesdell 136,287
Washing machine, (91,) T. Clocas, Jr 136,135
Washing machine, (91,) G. R. Davis 136,219
Washing machine, (91,) Owen and Brydges 136,335
Watch chain catch, (66,) L. C. Thiery 136,190
Water closet, (8,) J. Albee 136,199
Water wheel, turbine, (168,) J. N. and L. M. Asbury 136,206
Windlass for hoisting machines, (79,) J. Rushworth 136,270
Wrench, (100,) Jordan and Smith, (reissue) 5,294
Wrench, pipe, (100,) T. Williams 136,350
Wrench, self-adjusting pipe, (100,) T. Williams 136,351

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 25, 1873.

Aland, S., Journal box 136,198
Albee, J., Water closet 136,199
Arms, C., Game board 136,200
Armstrong, J. G. and J. S., Wagon seat 136,123
Asbury, J. N. and L. M., Turbine water wheel 136,206
Atkins, J., Machine for planing clapboards 136,201
Ballard, A. J., Steam pressure regulator 136,202
Baqnol, J., Compound for expelling flies from rooms 136,203
Barrett and Walton 136,290
Barth, H., Machine for planing stereotype plates 136,204
Batchelder, D. G., Machine for making sheet lead 136,124
Bauer, J., Gig saddle tree 136,285
Bean, D., assignee 136,195
Beard, M. McP., Wash boiler 136,125
Bearse, L. M., Deck light 136,299
Bennett, G. W., Apple parer, corer, &c 136,205
Bickford, H., Scroll saw 136,297
Black, H., Railroad switch 136,126
Blake, L. R., Lasting tool 136,300
Blazer, J. B., assignee 136,131
Bond, J. N. B., Apparatus for rendering lard, treating offal, &c 136,208
Borden, T., Pruning shears 136,209
Bortree, M. K., Bustle 136,127
Bradford, L. G., Bedstead fastening 136,301
Bralley, P., Swimming bath 136,128
Brewster & Co., assignees 136,255
Broadnax, A., Rendering apparatus for fats, offals, &c 136,129
Brower, H. L., Burglar alarm 136,210
Bryant, A. H., Egg carrier, (reissue) 5,293
Brydges and Owen 136,335
Buck, M., Tenoning machine 136,211
Burton, B., Metallic cartridge 136,130
Bye, W. C., Sulky harrow 136,131
Calkins, J. B., Water tank for railway stock cars 136,132
Canis, A., and F. Higgins, Loom 136,133
Chichester, L. S., Food compound 136,302
Chichester, L. S., Food compound 136,303
Chichester, L. S., Food compound 136,304
Chichester, L. S., Articles of food from cereals 136,305
Chichester, L. S., Preparing corn meal for shipment 136,306
Clark, C., Hoisting apparatus 136,212
Clark, W. R., Railroad rail joint 136,307
Clews, W., Cartridge retractor for revolving fire arms 136,134
Cloeas, T., Jr., Washing machine 136,135
Cobb, B. F., Riveting tool, (reissue) 5,297
Cochrane, J., Valve lubricator 136,136
Cochrane, J., Preventing corrosion of stay bolts in steam boilers 136,213
Cole, E. E., Steam boiler 136,214
Collins Company, assignee, (reissue) 5,294
Conaway, J., assignee 136,197
Cook and Parker, (reissue) 5,296
Corfield, W., Distilling together spirits of turpentine and alcoholic liquids 136,137
Corr, C. W., Hollow auger 136,138
Cowles, S. F., Milk cooler 136,215
Cubberley, G. B., Blacksmith's hammer 136,139
Current, H. A., Sewing machine 136,216
Curtis, M. A., Medical compound 136,308
Dake, H. M., Portable fence 136,217
Davies, T. A., Lantern 136,218
Davis, G. R., Washing machine 136,219
Davis, N. N., assignee 136,204
Dawdy, L. J., Hand cultivator 136,220
Day, E. A., Hose nozzle 136,309
Dennison, D. B., Cylinder cock 136,221
Denell, J. V., Bucket 136,140
Devlan, P. S., Car and window washer 136,310
Dew, J. M. A., Knob latch 136,141
Diehl, P., Magic lantern 136,142
Dietrich and Norman 136,258 136,259
Dillenbeck, A., Die for making clips for king bolts 136,143
Doubleday, M. C., Car coupling 136,222
Doughty, C. H., Candlestick 136,223
Dunfield, W. C., Privy indicator 136,224
Earickson, J. K., and J. R. Harris, Apparatus for pressing and packing tobacco 136,225 136,312
Eason, B., Rotary churn 136,226
Edwards, E., Machine for mixing and kneading dough 136,144
Edwards, G. A., and G. Schieder, Shuttle for sewing machines 136,311
Elliott, G., Railroad crossing 136,227
Elston, W. H., Carburetor 136,228
Emery, T., Device for rolling logs 136,145
Eppinger, I., manufacture of plug and bunch tobacco 136,312
Ernst, A., Revivifying charcoal used in rectifying spirits 136,229
Esser, D., Child's table napkin holder and clasp 136,146
Evert, C. L., and A. Johnson, Street letter box 136,313
Fagin, L., Trustee, assignee 136,207
Fantini and Timm 136,285
Faris, J. A., assignee 136,234
Farrar, O., Sewing machine 136,314
Finnigan, W. H., Combined ruler and pencil sharpener 136,230
Fleischmann, C. L., Revivifying charcoal used in rectifying spirits 136,147
Friday, R., Seed planter 136,231
Friedrich, J., assignee 136,166
Frost, T., Sash fastener and tightener 136,232
Gaskill, H. C., Fruit jar 136,148
George, E. M., Adjustable hinged gate 136,149
Giffard, P., Air repeating gun 136,315
Giffard, P., Compressed air defense stick 136,316
Gilman, C. H., assignee 136,193
Gird, E. D., Apparatus for cooling and transporting milk 136,150
Gladding, F. H., Buckle fastening 136,151
Glidden, C. W., Boot and shoe heeling machine 136,233
Glidden, C. W., Machine for lasting boots and shoes 136,317
Glidden, C. W., Lasting tool 136,318
Goodchild, W. H., and S. F. Hay, Joiner's clamp 136,152
Goodyear Rubber Head Pencil Company, assignee 136,319
Gorton, J., Chimney top 136,234
Grant, J. J., Die stock for cutting screws 136,153
Grant, R. C., Mechanism for feed nail plates 136,235
Gray, J., Lead pencil 136,319
Green, F. D., Dovetailing machine 136,236
Greene, C. W., Labeling machine 136,154
Groff, J. D., and K. H. Wilson, Pad for harness 136,155
Growdon, J., Car coupling 136,237
Hake, E. H., Trammel for lifting jack 136,156
Hall, C. S., Thrashing machine 136,238
Hall, H. L., Hand corn husker 136,157
Hall, J. L., Safe door hinge 136,239
Haller, E. G., Fruit jar 136,240
Hamilton, T. F., Corset 136,330
Hamilton, W. G., Manufacture of car wheels, (reissue) 5,298
Hamilton Steeled Wheel Company, assignee, (reissue) 5,298
Hard, P. C., Bed bottom 136,158
Harrington, M. W., Gun sight 136,159
Harris, and Earickson 136,225
Harvey, J. T., Grinding mill 136,321
Haskins, J. F., Vapor engine 136,241
Hawkins, G. C., Machine for burnishing boot and shoe soles 136,322
Hay & Co., assignees 136,148
Hay and Goodchild 136,152
Hedley, W., Composition for artificial stone 136,160
Hemenway, S. W., Railroad train indicator 136,242
Hersog, A., Extension table 136,243
Higgins and Canis 136,133
Hinden, M. J., Hatchway guard 136,161
Holton, S., Addressing machine 136,323
Hugg, J. S., and J. T. Stewart, Ruffler for sewing machines 136,162
Hughes, M. J., Stereotype block holder 136,244
Hulett, T., assignee 136,239
Hunt, G. S., Anti-friction metal 136,163
Hunter, J. T., and D. L. H. Mitchell, Plow 136,245
Inman, C., Rotary steam engine 136,164
Insles and Tarbell 136,260
Jaeger, G. L., Machine for making paper boxes 136,246
Jenkins, J., assignee 136,140
Johnson, A., Bosom, collar, &c 136,247
Johnson, L. S. and M. G., Articles of food 136,165
Johnson and Evert 136,313
Jones, J., assignee 136,202
Jones, J. T., Sewing machine 136,324

Jordan, L., and L. R. Smith, Wrench, (reissue) 5,194
Josef, F. P., assignee, (reissue) 5,300
Keith, A. B., assignee 136,340
Kemp and Neeley 136,256
Kendrick and Ogborn 136,174
Kent, A., Safety stud, &c 136,166
Kingwill, J. F., Harvester 136,325
Kisner, D. P., assignee 136,209
Kitson, R., assignee 136,173
Kollock, M. H., Railway car truck 136,248
Krieble, H. K., Cultivator 136,249
Kutscher, F., Bottle stopper 136,326
Leslie, L. R. N., Sewing machine oil cup support 136,327
Lewis, H., Hose coupling 136,328
Lieb and Sonnekalb, (reissue) 5,299
Lindsey, L. T., Transmitter for printing telegraphs 136,250
Lindsey, L. T., Telegraph repeater 136,251
Lindsey, L. T., Electro-magnetic motor for printing telegraphs, &c 136,329
Lockwood, E. W., Box for assorting peaches 136,252
Lockes, J., assignee 136,197
Long, J. M., Power hammer 136,253
Long and Allstatter 136,253
Macy, Moore, and Pierson 136,337
Magoon, T. P. L., Folding table, &c 136,167
May, R. B., Animal trap 136,330
Mayer, T., Flier for roving and spinning frames, (reissue) 5,295
McKinnon, K., Cultivator 136,254
Meddows, I. O., Running gear for vehicles 136,331
Milbank, I. M., Metallic cartridge 136,168
Mitchell and Hunter 136,245
Mittendorf, H., Revolving harrow 136,169
Mivelar, L. L., Smoothing iron 136,170
Moore, Pierson, and Macy 136,337
Mosier, J. L. H., King bolt for carriages 136,255
Malley, J., Preparing lumber for joiner's use 136,332
Murphy, J., Machine for grinding harvester knives 136,171
Murphy, P., Stereoscope 136,333
Murray, Dougall & Co., assignees 136,172
Murray, S. W., Punching machine 136,172
Myers, D. E., Mechanism for transmitting power 136,334
Neeley, J., Jr., and T. P. Kemp, Elastic check rein 136,256
Nichols, J. R., Plow 136,257
Norman, H., and C. F. Dietrich, Pump 136,258
Norman, H., and C. F. Dietrich, Air engine 136,259
Noton, W., Feed mechanism for cotton openers, &c 136,173
Ogborn, H., and A. W. Kendrick, Broadcast seeder 136,174
Owen, D. J., and J. G. Brydges, Washing machine 136,335
Paden, J. B., Rewinnowing attachment for thrashers 136,175
Paine, S. W., Shot cartridge 136,336
Palmer, C. B., assignee 136,161
Parker, J., and L. Cook, Hydraulic telescopic platform elevator, (reissue) 5,296
Patrick, C. E., Grain drill 136,260
Pengelly, T. N., Car coupling 136,176
Petitt, H., Bridge 136,177
Phelan, G. E., Billiard table cushion 136,178
Phelps, I. M., Furnace for chlorodizing ores 136,261
Pierce, C. H., assignee 136,193
Pierson, D., J. W. Macy, and J. D. Moore, Corn planter 136,337
Platt, C. H., and G. A. Stanbery, Knitting machine needle 136,262
Potter, M., Plow wheel 136,179
Powers, D. J., Woven wire mattress frame 136,180
Prescott, E., assignee, (reissue) 5,297
Price, C. H., assignee 136,193
Provost, P. C., assignee 136,140
Quigg, J. F., Swing 136,181
Rae, M., Manufacture of fuel 136,263
Randall, G. H., Combined atmospheric exhaust pump and funnel 136,264
Redheffer, J., Machine for holding and soldering cans 136,265
Reed, S. H., and T. Thompson, Harvester cutter 136,266
Reese, A. and J., Machine for corrugating sheet iron 136,267
Rich, P. S., Wagon body and seat 136,268
Rittenhouse, S. B., Lath machine 136,189
Roberts, C., Latch for gates, &c 136,183
Row, J. W., Screw cutting machine 136,269
Rushworth, J., Windlass for hoisting machines 136,270
Russell, J., Adjustable nut 136,184
Sanford, G., Machine for dressing brasses of journal boxes 136,336
Sawyer and Tarble 136,188
Schleder and Edwards 136,311
Sears, E. B., Compound for destroying insects, &c 136,185
Shelton, N. K., Carpet stretcher 136,339
Shorey, S. W., Machine for forming staple seams in leather 136,340
Smith, J. D., Corn planter 136,341
Smith, J. G., Wire mattress frame 136,271
Smith, P. A., Railway snow plow 136,272
Smith and Jordan, (reissue) 5,294
Sonnekalb, A., and J. W. Lieb, Traveling bag, (reissue) 5,299
Southwick, O. M., assignee 136,242
Stanbery and Platt 136,262
Standish, S., Broom 136,273
Stearns, J. B., Duplex telegraph instrument 136,274
Stebbins, M. C., Inkstand filler 136,186
Stewart and Hugg 136,102
St. Martin, W., Billiard light 136,275
Steelton, J. K., Sofa bedstead 136,276
Striber, E., assignee, (reissue) 5,300
Stubbs, J. W., Fertilizer 136,277
Sutton, L. B., Cotton seed planter 136,342
Swarts, S., Lifting bridge 1 6,278
Swope, Z., Harvester 136,279
Symonds, T., Dredger 136,187

Taber, W. D., Egg carrier, (reissue) 5,300
Tarbell, M. W., and J. H. P. Inslee, Crib attachment for bedsteads 136,280
Tarble, F. W., and H. W. Sawyer, Knife polisher 136,188
Taylor, A. J., Revolving rake shoe 136,189
Taylor, S., Lifting jack 136,281
Taylor, S. P., assignee, (reissue) 5,296
Thayer, W. H., Bobbin for sewing machine shuttles 136,282
Theberath, C. M. and J. H., assignees 136,205
Thiery, L. C., Watch chain catch 136,190
Thomas, J. H., Insulator for battery cups 136,191
Thompson and Reed 136,266
Tice, I. P., Towing canal boats 136,343
Tice, I. P., Steam vacuum pump 136,344
Tilton, J. C., Wash boiler 136,283
Timby, T. R., Vehicle spring 136,284
Timm, F., and T. Fantini, Cigar tip cutter 136,285

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

EXTENSIONS.

Hereafter, unless the final fees in extension cases are paid in time to admit of the certificates of extension being signed and attached to the original patents before expiration, the extensions will be refused.

M. D. LEGGETT,
March 18, 1873. *Commissioner.*

COMMISSIONER'S DECISIONS.

L. C. CLARK.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Lucas C. Clark for patent for* SCREW-DRIVER, *filed March* 11, 1872.—*Decided March* 6, 1873.]

ARTICLE OF MANUFACTURE—NOVELTY.

To cast the handle of a screw-driver upon the tang of the blade does not possess the merit of novelty, since it is common to attach the handles of knives and other implements in the same way.

It is also common to cast the handle in such cases hollow, and a screw-driver so constructed is not new as "an article of manufacture."

LEGGETT, *Commissioner:*

Applicant claims as a new article of manufacture a screw-driver provided with an oval hollow metallic handle cast upon the tang of the blade. It has long been the practice of manufacturers to cast handles of suitable forms upon the tangs of knives, forks, &c. A patent was granted to Geo. Ropes in 1838 covering this method. The reference cited by the Examiner shows a knife with an oval-slotted handle cast upon the tang of the blade. Applicant dwells upon the fact that he casts his handle hollow or concave. In view of the state of the art of casting, this cannot be regarded as constituting invention and conferring patentable novelty upon the screw driver as an article of manufacture. As the Board observe, "the casting of handles hollow to save metal and secure lightness is not original with applicant. It is an old and common device." It does not render the handle a substantial improvement, involving invention upon that shown in the patent of Lewis Hart, cited by the Examiner. The device presented is, in view of the references, deficient in novelty, and therefore is not "*so* different in essential points" as to be patentable as an article of manufacture.

WOOD *vs.* MORRIS.—*Interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference between the application of Joseph Wood, for patent for* IMPROVEMENT IN RAILWAY-FROGS, *and the patent of Wm. Morris, granted January* 9, 1872.—*Decided March* 8, 1873.]

PRACTICE IN ISSUES AS TO NOVELTY OCCURRING DURING THE PENDENCY OF AN INTERFERENCE.

The question of the novelty of the invention should be settled before an interference is declared, but if it is subsequently made a distinct issue the Office is bound to consider it.

After the time first appointed for taking testimony in an interference has expired, the case will be opened for taking further testimony upon the affidavit of one of the parties that he has newly-discovered evidence such as shows that the invention had been in previous use.

Although the new testimony is cumulative merely, evidence to the same effect having been given before, yet upon the question of novelty the case will be reopened, but will not be on the question of priority.

LEGGETT, *Commissioner:*

This is a motion on the part of the patentee to reopen this case for the purpose of taking further testimony as to the public use of the invention in contro-

versy. The testimony closed on the 17th ultimo, and no hearing has yet been had. Motion is based upon the affidavit of the patentee setting forth his recent discovery of the evidence he seeks to introduce, and the reasons why it could not be put in before the expiration of the time allotted for taking testimony. If the proposed evidence were of a different character, and rested upon the affidavit of the patentee alone, the motion would unhesitatingly be denied. But it is calculated to show that the subject-matter in issue is not new, and therefore not patentable to either party. The question of novelty is always a proper one for consideration in the Office at any time prior to the grant of a patent. Although it is intended to be and should, as far as possible, be settled in all cases before an interference is declared, if it is made an issue subsequently it cannot be ignored. In the record in this case it appears that one of the witnesses, James Neafie, testifies to the use by himself of wood in railway-frogs substantially as claimed by the applicant, and names several persons whom he alleges are cognizant of such use. It is objected that further testimony upon this point is merely cumulative, and should not therefore be admitted. No doubt it is cumulative in its character, but that is a reason, in a case of this kind, why it should be admitted. This is not in the nature of a motion for a new trial. If the proposed testimony bore upon the issue of priority between the parties, the objection would hold, and the testimony would be excluded. But it goes to a different issue—the question of the novelty of the invention—and therefore the objection fails. The question of novelty is not an issue between the parties to this interference as such, but between the parties and the public. For the protection of the public it is the province of the Commissioner to see that patents are granted for new inventions only. The testimony of the witnesses named will therefore be allowed to be taken upon the question of the public use of the alleged invention, and an opportunity will be afforded the applicant for taking testimony in rebuttal, if he desires to do so. If this course were not adopted now, in view of Neafie's testimony, an interference would have to be declared at the termination of this one (if priority should be adjudged in favor of the applicant) before a patent could be issued. It is better for the Office and the parties that the whole matter be disposed of at once. The Examiner of Interferences will assign suitable time for the parties to take testimony, respectively, as above indicated.

H. W. PUTNAM.—*Extension.*

[*In the matter of the application of Henry W. Putnam for extension of reissued patent No. 1,606, granted January 19, 1864, original patent No. 23,263, granted March 4, 1859, for* BOTTLE-STOPPER FASTENING.—*Decided March 10, 1873.*]

A claim which has been sustained by a United States Court on full consideration of the same references as are before the Commissioner will not be questioned by him, though he may doubt its validity.

Points which did not engage the particular attention of the Court, though they were before it and were embraced in the decision, may be considered anew by the Commissioner if good reasons are shown.

Where a much larger sum had been saved to the public, $21,000 will not be considered an adequate remuneration, and the patent will be extended although that sum has been realized from it in net profits.

A patent will be extended although there may be doubt whether the extended term is in the patentee or his wife.

LEGGETT, *Commissioner:*

This invention consists of a fastening for bottle-stoppers composed of two pieces of wire peculiarly bent and combined. The first piece, the central part of which is to rest on the stopper and hold it in place, is bent horizontally in the middle in the form of a U, the end portions returning a short distance and then being bent perpendicularly, so as to straddle the cork and nozzle and hinge at their extremities, which are turned outward, into loops of a specific formation in the second wire, that surrounds the neck of the bottle. It is intended that the first or bail-like wire shall swing over the cork from only one side of the bottle-neck, and that its motion shall be automatically arrested when it has arrived in position on the top of the cork. To secure this result the loops in the second or neck wire are formed so that both will bind the ends of the first and obstruct it as soon as it is swung up to the perpendicular. When the cork is pressed outward by aerated liquids within the bottle these loops prevent the bail-wire from being swung further over and off the cork, while the peculiar horizontal U-formed top causes the cork itself, in its efforts to escape, to partially double and bind against the inner surface of the nozzle, thus securing itself more firmly and preventing the bail-wire from swinging back off the cork in its free direction. The device is admirably adapted for its purpose, and, considered as a whole, its novelty and utility are unquestionable. In the reissued patent now under consideration, however, there are four claims covering the specific construction of its principal parts. The novelty of each of these separate elements must be established before other matters affecting the propriety of granting an extension of the patent with its present scope can be considered. The claims are as follows:

"1. Forming the fastener at the part that comes over the cork of a piece of wire of a U form, with the ends returned and connected to the bottle, in order that the pressure on the cork or stopper may cause the fastener to hold more securely, as specified.

"2. A wire fastener for a cork or stopper in which the ends of the wire are bent nearly at right angles to form the joint or hinge on which the fastener is turned, substantially as specified.

"3. Forming the eyes for the reception of the fastener by means of a wire bent as set forth.

"4. A wire fastener for the stoppers of bottles, fitted so that it can be pressed aside from over the stopper, as set forth, in combination with a band or fastening attaching the same to the neck of the bottle, as specified."

It appears that the reissued patent has been repeatedly litigated and sustained. This, however, is not conclusive of the question of novelty. It is competent for the Commissioner to consider this question so far as it may be affected by matters not before the court, and I think also with reference to points that were before the court generally, but as to which there appears to have been no specific consideration and adjudication.

Upon a critical examination of all the references cited by the remonstrants and referred to by the Examiner, I find no ground for doubt as to the validity of the first and fourth claims. The English patent of Masters, No. 12,330, of 1848, which seems to be chiefly relied upon, does not present the subject-matter covered by the first claim. The ends of the wire (if wire is shown) bent to form the U are not "returned" at all, but are bent at right angles from the ends of the U and connected to the bottle. The construction and operation of the bail-like portion of this fastening are manifestly unlike Putnam's in the U part, and are as manifestly inferior. The second claim I should certainly reject if it did not appear that the court has particularly considered it, and the references by which it appears to me to be met, and expressly and unequivocally pronounced it good and valid. With regard to the English patent of Chalus, No. 2,088, of 1856, to which I refer, Justice Miller said: "In Chalus' patent the eyes formed upon the neck-wire have their planes radial with the bottle, instead of parallel with the sides of the bottle; and the hinges in the bail are formed by the loops of the wire bent around in a plane parallel to the sides of the bottle, instead of having merely short gudgeons standing radially to the bottle." This is not the opinion to which I have been led from an inspection of the English drawings, which, however, are somewhat imperfect. It is true there are important differences between the construction and operation of the hinge connection of Putnam as a whole and that shown by Chalus; but as to the precise point expressed in the second claim I should have little doubt of their practical identity. The third claim, upon cursory examination, would appear to be exactly met by this patent; but upon a careful consideration of the specific construction and office of the eyes or loops it covers, I have no hesitation in declaring the opinion that it is valid, even if the correctness of Justice Miller's criticism above quoted be denied. The loop in Chalus' device is not formed so as to bind the bail-wire and prevent it from turning except in one direction. Such a use of the loop evidently was not contemplated, and, in fact, is not possible without a modification of the loop and bail-piece as shown by Chalus. The illustrative model used by the remonstrants to show the Chalus fastening is not a true representation of it, so far as the hinge connection is concerned. As to the parts specially intended to be illustrated it is calculated to mislead, unless it be taken to designate and establish, as in fact it does, Putnam's improvements.

It was decreed by Justice Miller, with the state of the art fully before him, so far as the record shows, that Putnam was the original and first inventor of his fastening as patented and reissued, "*and of each and every part thereof claimed in said reissued letters patent as new, and that the said reissued letters patent and the several claims thereof are good and valid.*" I shall defer to the opinion of the court as to the second claim, and as to the novelty of the subject-matter of the others I have no doubt.

The utility of the fastening and its importance in the bottler's art are apparent from inspection, and are abundantly proved. It is one of those simple, complete devices in the use of which no conflict is developed between theory and practice. Of its kind it is just such an actual improvement as it is the purpose of the patent law to develop and reward. It is contended, on the part of the several remonstrants, that an erroneous basis of calculation of value has been adopted, but no proof is offered to sustain this point. On the other hand, it is pretty fully shown that no metallic fastening had proved a success before Putnam's invention, and that none but his has since. It appears to be proper, then, to consider the superiority of this device over the twine fastening, which, upon the proof, was the only one in actual use by bottlers at the date of this invention. The diligence of the inventor has been commendable and his remuneration considerable. He admits a net profit of over $21,000, but this is demonstrated to be only a fraction of the saving to the public effected by the invention, which has gone into almost universal and exclusive use in certain branches of bottling. The point has been made that the title in the extension, if granted, will be in Putnam's wife, under an assignment to her, appearing of record; and reference is made to the construction placed upon a contract of assignment by the Supreme Court in the case of the *Nicholson Pavement Co.* vs. *Jenkins*. The cases are somewhat different. But whatever may be the scope of that decision, I do not see that it can affect this case. The object the Office has in inquiring into title is to determine whether there is a sufficient interest in the patentee to warrant the presumption that the extension is for his benefit. The question as to title in this case is as to whether the extended term is in the patentee or his wife. However this may be, the patentee's interest is sufficient to warrant the extension.

The extension will be granted upon payment of the proper fees.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

MITCHELL *et al. vs.* HAWLEY.

[*Appeal from the Circuit Court of the United States for the District of Massachusetts.—Decision March*, 1873.]

CHARACTER OF THE OWNERSHIP ACQUIRED BY THE VENDEE OF A PATENTED ARTICLE.—THE RIGHT TO USE AS COMPARED WITH THE RIGHT TO MAKE AND VEND.

The rule is well established that when a patentee has himself constructed a machine and sold it without any conditions, or authorized another to construct, sell, and deliver it, or to construct and use and operate it without any conditions, and the consideration has been paid to him for the thing patented, the patentee must be understood to have parted to that extent with all his exclusive right, and that he ceases to have any interest whatever in the patented machine so sold and delivered, or authorized to be constructed and operated.

If the owner of a patented machine, whether he built it or purchased it, has also acquired the right to use and operate it during the lifetime of the patent, he may continue to use it until it is worn out, in spite of any and every extension subsequently obtained by the patentee or his assigns.

Purchasers of an exclusive privilege of making or vending a patented machine acquire an interest in the franchise which the patent secures; such interest terminates at the time limited for its continuance by the law which created the franchise, unless it is expressly stipulated to the contrary.

Where the sale of a patented implement or machine is absolute, and without any conditions, it becomes the private individual property of the purchaser, and he may continue to use it until it is worn out, or he may repair it or improve upon it as he pleases.

Where the patentee sold the exclusive right for specified territory to make and use, "and to license to others the right to use said machine" during the remainder of the original term, it being stipulated in the instrument of conveyance that the licensee "shall not in any way or form dispose of, sell, or grant any license to use the said machines beyond the expiration" of the original term: *Held*, that the sale of machines by such licensee, "with the right to run" the same, did not convey the right to use them beyond the term of the original patent.

Notice to the purchaser in such a case is not required, as the law imposes the risk, as to whether the title of the seller is such that he can make a valid conveyance, upon the purchaser as against the real owner.

This was an appeal taken by the defendants, Eben Mitchell, Charles Butters, and Henry Rust, from the decision rendered against them in the Circuit Court of the United States for the District of Massachusetts, in a suit in equity brought against them by Robert B. Hawley for an infringement of certain letters patent granted James F. Taylor, May 3, 1853, for new and useful improvements in machinery for felting hats.

The opinion of the Circuit Court is reported in Vol. 1 of the OFFICIAL GAZETTE, page 306.

[*F. H. Brooks*, of Boston, for appellants.
J. E. Maynadier, of Boston, for appellee.]

Mr. Justice CLIFFORD delivered the opinion of the Court.

Patentees acquire by their letters patent the exclusive right to make and use their patented inventions and to vend the same to others to be used for the period of time specified in the patent; but when they have made one or more of the things patented and have vended the same to others to be used, they have parted to that extent with their exclusive right, as they are never entitled to but one royalty for a patented machine, and consequently a patentee, when he has himself constructed a machine and sold it without any conditions, or authorized another to construct, sell, and deliver it, or to construct and use and operate it without any conditions, and the consideration has been paid to him for the thing patented, the rule is well established that the patentee must be understood to have parted to that extent with all his exclusive right, and that he ceases to have any interest whatever in the patented machine so sold and delivered or authorized to be constructed and operated.

Where such circumstances appear, the owner of the machine, whether he built it or purchased it, if he has also acquired the right to use and operate it during the lifetime of the patent, may continue to use it until it is worn out, in spite of any and every extension subsequently obtained by the patentee or his assigns. *Bloomer* vs. *Millenger*, 1 Wall., 350.

Patents were granted, under the prior patent act, for the term of fourteen years; but the provision was that a patentee in certain cases might have the term extended for seven years from and after the expiration of the first term, and the same section provided that the benefit of such renewal shall extend to assignees and grantees of the right to use the thing patented to the extent of their respective interests therein, which last provision has frequently been misunderstood. Such misapprehension has usually arisen from a failure to keep in view the well-founded distinction between the grant of the right to make and vend the patented machine and the grant of the right to use it, as was first satisfactorily pointed out by the late chief justice, with his accustomed clearness and precision. *Bloomer* vs. *McQuewan*, 14 How., 549; *Chaffee* vs. *Boston Belting Co.*, 22 How., 223.

Purchasers of the exclusive privilege of making or vending the patented machine hold the whole or a portion of the franchise which the patent secures, depending upon the nature of the conveyance, and of course the interest which the purchaser acquires terminates at the time limited for its continuance by the law which created the franchise, unless it is expressly stipulated to the contrary. But the purchaser of the implement or machine for the purpose of using it in the ordinary pursuits of life stands on different grounds, as he does not acquire any right to construct another machine either for his own use or to be vended to another for any purpose. Complete title to the implement or machine purchased becomes vested in the vendee by the sale and purchase; but he acquires no portion of the franchise, as the machine, when it rightfully passes from the patentee to the purchaser, ceases to be within the limits of the monopoly.

Patented implements or machines sold to be used in the ordinary pursuits of life become the private individual property of the purchasers, and are no longer specifically protected by the patent laws of the State where the implements or machines are owned and used. Sales of the kind may be made by the patentee with or without conditions, as in other cases; but where the sale is absolute, and without any conditions, the rule is well settled that the purchaser may continue to use the implement or machine purchased until it is worn out, or he may repair it or improve upon it as he pleases, in the same manner as if dealing with property of any other kind.

Letters patent were granted to James F. Taylor for new and useful improvements in machinery for felting hats, bearing date the 3d of May, 1853, securing to him the exclusive right to make and use, and to vend to others the right to make and use, the said machines for the term of fourteen years from the date of the letters patent.

Due conveyance or license, subject to certain restrictions and limitations, was made by the patentee of the exclusive right to make and use, "*and to license to others the right to use, the said machines*" in the States of Massachusetts and New Hampshire *during* the remainder of the original term of said letters patent, it being expressly stipulated in the instrument of conveyance that the licensee "*shall not, in any way or form, dispose of, sell, or grant* and license to use the said machines beyond the expiration" of the original term. Apart from that the patentee also stipulated that the said licensee, if the patent should be extended, should have the right to control the same in those two States, he paying to the grantors in his license, or their heirs and assigns, a fair and reasonable compensation for the same, on terms as favorable as may be offered to any other person or party.

Bayley, as such licensee, on the 18th of March, 1861, constructed four machines, being two sets, and sold the machines, "with the right to run" the same, to the grantors of the respondents for the sum of $1,200, executing to the purchasers at the same time a license under his hand and seal, authorizing the purchasers, as such licensees, "to run and use two sets (four machines) for felting hats, in said town of Haverhill, under Taylor's patent, bearing date as specified in the original letters patent," showing conclusively that the purchasers were referred to the original letters patent as the source of his authority.

Of course said letters patent expired on the 3d of May, 1867, and the record shows that the Commissioner, before the term expired, renewed the letters patent and extended the same for the further term of seven years from the expiration of the original term, and that the complainants, having become by certain mesne conveyances, duly recorded, the exclusive assignees of the right, title, and interest in the renewed letters patent for those two States, instituted the present suit to restrain the respondents from using the four machines which they or their grantors purchased of the licensee under the original letters patent.

They appeared to the suit and filed an answer, setting up as a defense to the charge of infringement that they are by law authorized to continue to use the four machines just the same under the extended letters patent as they had the right to do under the original patent, when the purchase was made by those under whom they claim, which is the only question in the case.

No one in general can sell personal property and convey a valid title to it unless he is the owner or lawfully represents the owner. *Nemo dat quod non habet.* Persons, therefore, who buy goods from one not the owner, and who does not lawfully represent the owner, however innocent they may be, obtain no property whatever in the goods, as no one can convey in such a case any better title than he owns, unless the sale is made in market overt, or under circumstances which show that the seller lawfully represented the owner. *Foxley's case*, 5 Coke, 109 a., 2 Bl. Com., 449, 2 Kent Com., 11th ed., 224; *Williams* vs. *Merle*, 11 Wend., 80; *Stone* vs. *Marsh*, 6 B. & C., 551; *Marsh* vs. *Keating*, 1 Bing., N. C., 198; *Marsh* vs. *Keating*, 2 Cl. & Fin., 250; Benjamin on Sales, p. 4; *White* vs. *Spettigue*, 13 M. & W., 603; 1 Smith Lead. Cas., 7th ed., 1195; 1 Para. Con., 5th ed., 520.

Argument to show that the grantor under whom the respondents claim never acquired the right to sell the machines and give their purchasers the right to use the same in the ordinary pursuits of life beyond the term of the original patent is certainly unnecessary, as the instrument of conveyance from the patentee to him, which describes all the title he ever had, expressly stipulates that he shall not in any way or form dispose of, sell, or grant any license to use the said machines beyond the expiration of that term of the patent, and the form of the license which he gave to the purchasers shows conclusively that he understood that he was not empowered to give a license which should extend beyond that limitation.

Notice to the purchaser in such a case is not required, as the law imposes the risk upon the purchaser, as against the real owner, whether the title of the seller is such that he can make a valid conveyance. Certain exceptions undoubtedly exist to that rule, but none of them have any application to this case. Suppose the rule was otherwise, and that the real owner, in order to defeat the title of the purchaser, must show that the latter knew what the facts were, the Court would still be of the opinion that the decree ought to be affirmed, as the terms of the license which the seller gave to the purchasers were sufficient to put them upon the inquiry, and it is quite obvious that the means of knowledge were at hand, and that, if they had made the least inquiry, they would have ascertained that their grantor could not give them any title to use the machines beyond the period of fourteen years from the date of the original letters patent, as he was only a licensee and never had any power to sell a machine so as to withdraw it indefinitely from the operation of the franchise secured by the patent.

Decree affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

23,283.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,291.—*Metallic Bands for Boiling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Envelopes.*—Granted to SIMON E. PETTIS, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Balancing Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD EBER, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 28, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PUTNAM and WILLIAM C. BOOME, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,596.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibres from Waste Felted Fabrics.*—Granted to JOHN F. GREENER, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENER, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 12, 1859; reissued, No. 2,057, August 20, 1865. Hearing April 2, 1873.

23,685.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD B. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 20, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,634, 4,635, and 4,636, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 2, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,973, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 5,239, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Oyster-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERRIMON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,830.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,903.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,023.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 6, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,064.—*Apparatus for Heating the Feed-Water of Steam-Boilers.*—Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,066.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,103.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,190.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MERITON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMENT, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,152.—*Attachment to Ruling-Machines*, granted to JOHN B. BLAIR, March 8, 1859.

Claim.—The application of one or more magnets (electro-magnets) to any ruling-machine for ruling paper, in such manner that the magnets shall, either directly or indirectly, be made to control the operations of the pens, through the agency of the paper, in breaking, closing, or changing the circuit of electricity.

23,172.—*Machine for Printing Railroad and other Tickets*, granted to RICHARD M. HOE, March 8, 1859.

Claim.—1. The peculiar mechanism, or its equivalent, for moving the registering-disks on their axes at the proper times, by which means the tickets are numbered consecutively, substantially as described.

2. Giving such a movement to the registering-disks as will cause said disks to approach, press against, and travel with the impression-cylinder, thus giving an impression to the roll of paper, then recede to change the figures of the disks and allow the inking-roller *c31* to perform and then again to approach the impression-cylinder, and so on as before, substantially as before described.

3. The adjustment of any derangement of the registering-disks caused by slip, jar of the machine, or other cause, by means of the plates *c32* and *c33*, or any other means substantially the same.

4. Inking in a different color the registering figures by means of a separate inking apparatus, substantially as described.

5. The printing the numbers on the tickets while the said tickets are continuously advancing, in the manner substantially as above described.

6. The guide *c39*, placed between the impression-cylinder and the cutter Y, or its equivalent, for retaining the strip of continually-advancing paper in its proper direction, while its lower end is stopped by the action of the cutter when separating a ticket from the roll.

7. The combination of the parts by which the tickets are deposited (after being cut) in a vertical position in contradistinction to flatwise in the trough *c43* destined to receive them.

8. The combination of the slide *c46*, the spring-catches *c44 c44*, and the sliding block *c45*, by which the accumulating tickets are kept in a vertical position.

23,246.—*Meat-Mincer*, granted to ALBERT W. HALE, March 15, 1859; reissued December 28, 1865, numbered 2,136.

Claim.—1. The use and application of a flanged cylinder or cylinders, having the grooves between each flanges tapering and diminishing in depth, substantially as set forth.

2. The use and application of a cylinder or cylinders having spiral flanges with grooves between them diminishing or tapering in depth, substantially as set forth.

3. The combination of two cylinders with spiral flanges, so arranged that the flanges of one cylinder overlap those of the other, so that the cylinder operated by the power or crank will give motion to and rotate the other without the interposition of other gearing.

4. The combination of a cylinder or cylinders, having spiral flanges or tapering grooves, with a shearing-knife and a case having spiral ribs on its inner surface, substantially as set forth.

5. The combination of two cylinders or conic frustums, having straight or spiral flanges or tapering grooves, with a knife or case with or without spiral ribs.

6. The combination of two cylinders, having spiral flanges and tapering grooves, with a shearing-knife and a case having spiral flanges.

23,263.—*Improved Bottle-Stopper Fastening*, granted to HENRY W. PUTNAM, March 15, 1859; reissued January 19, 1864, numbered 1,606.

Claim.—1. Forming the fastener at the part that comes over the cork of a piece of wire of a U form, with the ends returned and connected to the bottle, in order that the pressure on the cork or stopper may cause the fastener to hold more securely, as specified.

2. A wire fastener for a cork or stopper in which the ends of the wire are bent nearly at right angles to form the joint or hinge on which the fastener is turned, substantially as specified.

3. Forming the eyes for the reception of the fastener by means of a wire bent as set forth.

4. A wire fastener for the stoppers of bottles, fitted so that it can be pressed aside from over the stopper, as set forth, in combination with a band or fastening attaching the same to the neck of the bottle, as specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 4, 1873.]

6,460.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,461.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,462.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,463.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,464.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,465.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,466.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,467.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,468.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,469.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,470.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,471.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,472.—*Carpets.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,473.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,474.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,475.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,476.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,477.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,478.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,479.—*Carpets.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass.

6,480.—*Carpets.*—HEINRICH F. GROTZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place.

6,481.—*Carpets.*—HEINRICH F. GROTZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place.

6,482.—*Carpets.*—JOHN HAMER, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,483.—*Carpets.*—JOHN HAMER, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,484.—*Carpets.*—CHARLES S. LILLEY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,485.—*Carpets.*—CHARLES S. LILLEY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,486.—*Carpets.*—DAVID MCNAIR, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.

6,487.—*Carpets.*—THOMAS J. STEARNS, Natick, assignor to THE ROXBURY CARPET COMPANY, Boston, Mass.

6,488.—*Ornamentation.*—GEORGE ROGERS FAGAN, Philadelphia, Pa.

6,489.—*Bottle.*—HENRY SAWYER, Chelsea, Mass.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date March 4, 1873.]

1,153.—*Coffee, Spices, &c.*—WM. H. CRAWFORD & CO., Baltimore, Md.

1,154.—*Shirts, Shirt-Fronts, &c.*—LEOPOLD STERNBERGER, Philadelphia, Pa.

1,155.—*Manufactured Tobacco.*—JOHN W. STONE, Lynchburg, Va.

1,156.—*Medicinal Compound.*—HENRY A. TILDEN, New Lebanon, N. Y.

1,157.—*Chemical Compound.*—JAMES W. CHISHOLM, New York, N. Y.

1,158.—*Bread.*—MAC WILLIAMS & PIPER, Baltimore, Md.

1,159.—*Smoking-Tobacco.*—JOHN W. STONE, Lynchburg, Va.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date March 4, 1873.]

ORIGINAL PATENTS.

136,354.—*Braider for Sewing-Machines.*—ELIZA H. ALEXANDER, New York, N. Y.

The conical tube, flattened at one end, and adapted to the size of the braid, is slipped into the holder of the bracket attached to a quilting or other guide, and this tube may be turned as desired to turn the braid for fancy patterns.

Claim.—The conical and adjustable tube A, constructed substantially as described, and combined with the bracket D and a quilting or other guide, as and for the purposes set forth.

136,355.—*Braiding Attachment for Sewing-Machines.*—ELIZA H. ALEXANDER, New York, N. Y.

The braid-guide has a passage for the braid, is fitted loosely in an opening in the presser, may be withdrawn and turned over when a corner is being turned, and the projection on the guide retain it in proper position.

Claim.—The braiding-guide, constructed substantially as described, and secured to the presser-foot or quilting-gage of a sewing-machine, so as to be turned over at the pleasure of the operator during the operation of braiding, or without removing the braid from the guide.

136,356.—*Smut-Mill.*—AMOS D. ASH, Swayne county, N. C., assignor of one-half his right to JOSIAH CURTIS, Knoxville, Tenn.

Outer case constructed with longitudinal dust-exits. Cockle-sieve in bottom around grain-exit. Grain fed in top is carried against smooth perforated case by arms, which act also as fan to furnish blast for carrying off dust, &c.

Claim.—1. In a smut machine or mill, the case or shield S, provided with a vertical opening or mouth, M, substantially as and for the purposes set forth.

2. In a smut machine or mill, the perforated bottom K, concaved or troughed from the central opening to the circumference, substantially as and for the purposes set forth.

3. The vertical edges N N of the parts of the cylinder in a smut-mill inverted so as to form the obstructions, substantially as and for the purposes set forth.

4. The combination, in a smut machine or mill, of the shield S and the bottom M and the inverted vertical edges N, as described, with the fan beaters or wings G G and perforated cylinder C, substantially as described, and for the purposes set forth.

136,357.—*Head-Rest.*—IRVIN BELFORD, Caldwell, Ohio.

The plate can be raised or lowered, as desired, to accommodate it to the height of the writer's hand.

Claim.—The combination of the plate A with the journals B B, the right-and-left-hand screw-rod C, the arms D D, and the legs E E, substantially as and for the purpose set forth.

136,358.—*Band-Comb.*—ELIAS BROWN, Wappinger's Falls, N. Y.

Ornaments may be attached to the arch or rib surmounting the comb.

Claim.—The combination, with a band-comb, A, of an ornamental arch or displayed crown, B, placed over the central portion

of the band and at right angles to the plane of said band, substantially as described.

136,359.—*Railway Car.*—HENRY BUCK, Polo, Ill.

When a down-grade is reached the front end of the horse-power is raised, thereby depressing the rear end and loosening the pulley-band E so as to render the horse-power inoperative. The same is done when the wind-wheel is used.

Claim.—1. The frame D, which contains the wheels and endless chains of the horse-power, pivoted at G, and operated by the cranks I and suitable cords or chains, substantially as described, and for the purpose set forth.

2. As a means for propelling railway cars, the combination of the horse-power and wind-wheel, when both are constructed and arranged to operate as described.

136,360.—*Bolster-Spring for Vehicles.*—HENRY BUCK, Polo, Ill.

A simple and efficient form of spring is constructed of strips of gum.

Claim.—The combination of the stands B B, rollers C C, gum E E, and bar D, substantially as and for the purpose hereinbefore set forth.

136,361.—*Plow.*—NICHOLAS BURCH, North Fairfield, Ohio.

The standard is provided with a flange, which embraces the beam and affords a support for the colter.

Claim.—In the construction of plows, the wood beam A and iron standard B provided with the colter-holder F, and having a shoulder, C, and flange D, in combination with screw-bolts, or their equivalents, for securing the said beam and standard together, substantially as and for the purpose set forth.

136,362.—*Box-Plaiting Machine.*—ORANGE M. CHAMBERLAIN, New York, N. Y., assignor of one-half his right to WM. B. CARRINGTON, same place.

Two intermittingly-reciprocating blades or plait-formers are situated in front of a pair of rollers, where the fabric passes between them, one blade being above and the other underneath the fabric. A pair of reverse plaits are formed together, making the box-plait. The formers are operated by means of pitmen, crank-levers, and a double crank on a driving-wheel.

Claim.—1. The double cranks *a a* and pitmen *s s*, for operating the formers.

2. The crank-levers *g g* and spindles *t t*, in combination with the formers G G.

3. The friction-cones K K and springs *l l*, in combination with the guides J J.

4. The combination of the shafts H and K, for the purpose described.

5. The combination of the cranks *a a*, pitmen *s s*, with the intermittent action of the delivering-rollers B.

136,363.—*Water-Meter.*—EMILE EUGENE PIERRE CLATSOLLES, Barcelona, Spain.

Upon a rod that unites two pistons are arranged adjustable collars, between which bears a forked lever that oscillates upon a shaft, which has at its end a counter-weight fixed upon it. The oscillating movement of the counter-weight communicates motion to a lever connected with a slide-valve, which, every time it changes position, allows the water measured by one of the cylinders to be discharged.

Claim.—1. The two cylinders A A', open at their inner ends, arranged on the same axis, and so situated within an outer casing as to be surrounded by water, in combination with the two connected pistons F F', and with the devices described, or their equivalents.

2. The combination, with the cylinders and pistons, and with the inlet and outlet pipes and casing of the apparatus, of a distributing slide-valve, *a*, operating substantially as specified, and receiving its movement from the pistons through the medium of the devices described, or their equivalents.

3. The combination of the shaft O, carrying the counter-weight T for operating the valve, its lugs *c* and *c'*, the arm N with its lug *b*, and the collars M M' on the piston-rod, all substantially as specified.

4. The combination of the rack Q secured to and moving with the pistons, the shaft Q with its pinion and ratchet-wheel, and a train of registering-wheels, all substantially as and for the purpose specified.

5. A water-meter in which the operating and indicating devices are arranged entirely within a hermetically-sealed water-chamber, as and for the purpose set forth.

136,364.—*Water-Filter.*—WALTER M. CONGER, Newark, N. J., assignor to himself, JAMES NOON, and JOHN NOON, same place.

The hollow cylinder is provided with a metallic casing divided by perforated metallic partitions into a number of chambers to receive filtering material. Drain-cocks are set in the under side of the cylinder to communicate with grooves formed in the base of each of the several chambers. At each end of the cylinder are pipes, secured by screw-couplings, communicating with a supply-pipe. Cocks are arranged at each end of the pipes and in the supply-pipe, so that the closing of the cocks at each end of the filter-leg case will admit of the case being entirely removed without turning off the supply-water.

Claim.—1. In a water-filter, the stop-cock N, arranged as shown relatively to the independent connecting-pipe D, filter-case A A^1 A^2, and fixed pipe C^1 C^2, so that the filter-case may be removed at will without stopping off the water from the consumer.

2. In combination with the connecting-pipe D and proper controlling means *d*, the series of separately-removable filtering means E^1 F, &c., mounted in a tightly-inclosing case, A, with channels c^1 c^2 and cocks G^1 G^2 arranged to allow a reversion of the current through the whole or any part of the same at will, and to provide for a separate cleansing of each filter-chamber and each drain-channel, as herein specified.

136,365.—*Pipe-Coupling.*—JOSEPH CONNER, Philadelphia, Pa., assignor to himself and ISAAC P. WENDELL, same place.

The socket is slotted to admit of its yielding, as it advances over the smooth surface of the pipe, to any inequalities. The slots are made in the enlargements at the ends of the coupling or socket.

Claim.—The slots *b* in the ends of the couplings B to accommodate the enlargements *a* to inequalities of the surfaces of the pipes, in the manner above set forth.

136,366.—*Sash-Balance.*—JOHN J. COWELL, Newark, N. J.

The two-part case inclosing the usual pulley-wheel is grooved at its edge, and into the grooves are driven tapering plugs to force the case more tightly into the frame. Upon the sides of the frame are projecting spurs formed in the casting, which take into the wood to aid in securing the case in its mortise. Behind these projecting spurs are holes, so that the frame may draw from the mold, notwithstanding the spurs project forward from their bases.

Claim.—1. The spurs *c*, with holes O in the rear, so that they may project forward and still draw from the mold.

2. The wedge *b'* and corresponding openings *b b*, and nipples *c'*, or their equivalents, when used as and for the purposes herein set forth and described.

136,367.—*Soldering-Tool.*—LEWIS CUTTING, San Francisco, Cal.

The soldering-block is made in two pieces, in order to allow the working part to be cheaply renewed when burned out. A ferrule surrounds the lower block, having a groove in one side, and its flange enters the groove in the can to melt the solder.

Claim.—1. The block or cylinder, when constructed with the two parts A and B, substantially as and for the purpose described.

2. The adjustable ferrule C, when constructed and operated substantially as and for the purpose described.

3. The block or ferrule, when provided with the slit H for equalizing the flow of solder, substantially as herein described.

136,368.—*Water-Elevator.*—JAMES B. ERWIN and GEORGE H. SHOULTERS, Batavia, N. Y.

The upper series of pivoted levers are secured to two segmental gears. By moving up or down the handle attached to one of the gears the bucket is lowered or raised.

Claim.—1. The combination of the gears C C with the series of levers F, substantially as and for the purpose specified.

2. The combination of the gears C C, series of levers F, and the balance-weight P, operating in the manner substantially as and for the purpose specified.

136,369.—*Printing-Telegraph.*—MERRITT GALLY, Rochester, N. Y.

Pulsator, using revolving pendulum, sends the impulses controlling the unison of a series of instruments. Type-wheel hung in slotted bearings; printing effected by its own stroke against the paper. Two or more cylinders of paper used automatically brought into position for printing. Other features explained by claims.

Claim.—1. The combination, with a telegraphic instrument, of a revolving pendulum and its motor, so that the pendulum acts as a unison device, substantially as set forth.

2. The combination, with the transmitting device, of one or more single keys, each representing a number of separate types to be brought into use by a single stroke of the key, substantially as set forth.

3. The combination of conducting piles G and H^1 and connector A^2, or equivalents, forming a repeating circuit-closer, substantially as set forth.

4. Two or more instruments connected with a single telegraphic line, the relative positions of their type-wheels, in respect to the material impressed, being made to differ, so that the electric impulse causing the impression of a letter in one of the instruments will not cause the other to print, but that the printing may be carried on in the different instruments by different impulses, substantially as specified.

5. The combination, with a telegraphic line, of a pulsating instrument for controlling a number of transmitting or receiving instruments, the impulses of the transmitters or receivers occupying the intervals between the impulses of the pulsator of the line, substantially as specified.

6. The combination, with a single telegraphic line, of more than two working instruments, transmitting by different impulses and simultaneously employed, so that all may print or sound without confliction of their messages, substantially as set forth.

7. The combination, with a printing-telegraph instrument, of a sounding device, which may be operated simultaneously with the printing device, substantially as specified.

8. The combination, with a type-wheel, of a reciprocating journal-bearing, so that the printing may be effected by the movement of the type-wheel itself, substantially as specified.

9. The paper-holding cylinder, constructed and revolved so that the line of printing will be around its circumference, and having a longitudinal movement for placing the positions of the lines, substantially as set forth.

10. The paper-holding cylinder, containing internally the paper to be furnished to the outside, substantially as set forth.

11. The combination of a number of paper-holders and a motor which brings each into printing position one after the other so that the printing of the instrument may be continued upon one while the message is being removed from another, substantially as specified.

12. The form-wheel *m*, or equivalent, attached to a telegraphic instrument or type-writer, substantially as specified.

13. The paper creaser or marker *g g*, or equivalent, attached to a telegraphic instrument or type-writer, substantially as and for the purpose specified.

14. The repeating circuit-closer D G, or equivalent, when made adjustable, substantially as set forth.

15. In a telegraphic instrument or type-writer, a number of operating-keys representing different letters, such keys being struck simultaneously, when combined with a device for preventing the necessity of holding the keys until the entire number of letters is produced, substantially as set forth.

136,370.—*Harvester-Dropper.*—JOSIAH B. GATHRIGHT, Louisville, Ky.

Two shafts, provided with transverse slats, have their lower ends pivoted to the rear of the finger-bar, and, inclining upward and backward, are pivoted at their upper ends in a frame supported on the finger-bar. To drop the gavel, the shafts are rotated inwardly, and the lower slats are hinged to the shafts and deflected by guides to prevent contact with the ground.

Claim.—1. A platform for harvesting-machines, composed of the reversible gates C C, having their lower arms flexibly connected with the shaft, substantially as and for the purpose herein shown and described.

2. In combination with the gates C C, the guides E E, operating substantially as herein shown and described.

3. The gates C C, guides E E, pinions A A, cogs H H, shaft *g*, wheels K and L, and lever N, arranged and operating substantially as herein shown and described.

136,371.—*Door-Spring.*—GEORGE GEER, Plainville, Conn.

An upright pivot, incased in two spools or sleeves, surrounded by and making a complete spiral spring, is arranged, as in a frame, between two toggle-arms, the outer ends of which are pivoted to standards projecting, respectively, from the door and the top of the door-frame or casing, while their inner ends are forked and pivoted to each other. The arrangement of two spools between the spiral spring and the pivot enables the upper spool to turn with the upper part of the spring in one direction, while the lower spool turns with the lower portion of the spring, through the toggle-joint arrangement, in the opposite direction, securing free action of the spring. There is also an adjustability of the standards projecting from the top of the door-frame by means of a bolt and series of holes for the purpose of regulating tension.

Claim.—1. The spiral spring M, arranged to operate with the toggle-arms J J' and the standards G and I, substantially as and for the purpose specified.

2. The sleeves or spools L L', interposed between the pivot K and spring M, and arranged to turn in opposite directions, one with the upper and the other with the lower portions of the spring, substantially as and for the purpose specified.

3. The adjustable arm H, when arranged to operate with the standard G, toggle-arms J J', spring M, standard I, and door A, substantially as described, and for the purpose specified.

136,372.—*Turbine Water-Wheel.*—JOEL HARRIS, New Carlisle, Ind.

A water-wheel constructed with two separate and distinct sets of buckets, and two separate sets of gates and chutes, so that the water can be used upon either or both sets of buckets at once, and the wheel can be driven either from the center or from the periphery, or both at once.

Claim.—1. A water-wheel so constructed that it may be driven either from the center or from the periphery, or both at once, substantially as described.

2. The wheel *a* provided with the two sets of buckets *b c*, and two sets of chutes and gates, relatively arranged substantially as specified.

136,373.—*Street-Lamp.*—FREDERECK HARTMANN, Chicago, Ill.

The corner-rods are extended down and riveted to the socket, which fits over the end of the lamp-post. Inside the frame and around these rods are bent metallic clips, which serve to hold the glass in place.

Claim.—The lamp described, having the socket A, rods *b* with clips *d* and corner-plates *a*, the rods *b* being so placed in the angle of the corner-plates as to hold the glass against the lateral movement, as described.

136,374.—*Dovetailing-Machine.*—JOSEPH E. HASKELL, Baltimore, Md.

The four corners of bureau and other drawers are dovetailed at the same time.

Claim.—1. The combination of the upper and lower platforms L and L' with the clamps *c c c c* to hold the four sides of a drawer in a rectangular position while being dovetailed, substantially as described.

2. The combination of the long nut *n*, screw S, pin *i*, and cam F, and their operative mechanism with the tables L L', or their equivalents, to give the forward and side motion thereto, substantially as described, and for the purpose specified.

136,375.—*Manufacture of Fuel from Coal-Waste.*—JOSHUA R. HAYES, Washington, D. C., assignor of two-thirds of his right to FRANCIS C. HOOTON and JOHN RUTTER, West Chester, Pa.

Claim.—1. The process, as described, of combining calcareous clay and coal-waste with boiling water, and mixed under high heat in order to obtain the minimum of clay, ranging from eight to twelve per cent., for the purpose set forth.

2. The process, as described, of combining said mixture, under high heat, with the minimum of bitumen, ranging from one to four per cent., said bitumen forming with the calcareous clay, automatically, artificial asphalt, in the manner and for the purpose set forth.

136,376.—*Wheel for Vehicles.*—SAMUEL B. HENDMAN, Richmond, Ind., assignor of one-half his right to MATTHEWS BROS., same place.

The core is grooved for the reception of the spoke-tenons, which are scalloped and rest on the upper rounded edges of the band-partitions, leaving a space between the ends of the tenons and the bottom of the groove. The flanges are firmly connected by the partitions, and support the spokes laterally. The collars on the band are rolled down upon a slanting surface on the core. The spokes form arches above the band-partitions.

Claim.—1. A mortised metallic band, applied to a carriage-wheel in such manner as to present an arched form in its longitudinal section, and bearing upon a wooden arch of the hub, substantially as described.

2. The scalloped spoke-tenons fitted to and resting upon the rounded metallic ribs or connections O of the mortised band B, and inserted in a groove in the core A, and forming an arch below the ribs, substantially as set forth.

3. The spoke-tenons made shorter than the depth of the channel H, in combination with the channel H, whereby the core around the axle-box is relieved from strain, and the strain sustained by the ribs O and the arch above and below the ribs, substantially as set forth.

136,377.—*Treadle for Sewing-Machines.*—CHARLES J. F. KRAFT, Cleveland, Ohio.

Claim.—The sandals D, when pivoted at their backs or heels to the swinging rods C, and connected directly to the crank-shaft B, situated below the drive-wheel, all constructed, arranged, and operating substantially as herein shown and described.

136,378.—*Animal-Trap.*—JOHN KRUMMENAUER, New York, N. Y.

Compact and improved construction of self-setter, where the animal first cages itself and in escaping to the next compartment resets the trap.

Claim.—1. The combination, substantially as described, of the spring-retainer G with the vibrating yoke F and door or doors D.

2. The combination of the vibrating platform H carrying the bait, its arm *e*, and the spring-retainer G, constructed and arranged to operate substantially as described.

3. The combination, substantially as described, of the trap-doors, the yoke F, and the arm *i* of the door, arranged to bear against the said yoke.

4. The trap-frame, consisting of a flat bottom plate, *w*, strengthening-partition *v*, and curved walls X, formed of a single strip of sheet metal.

136,379.—*Calk for Horseshoes.*—JOHN J. MERVINE, New York, N. Y.

The calk rests in a recess in the shoe, and extends around on each side of the toe; has a pin at the middle, which enters a hole in the shoe, and on each side a nail-hole, through which, as also through the shoe, nails are driven into the hoof.

Claim.—1. The calk B, constructed and fitted to the shoe, as specified, jointly with the mode of attaching said calk to the shoe and to the hoof of the animal, hereinbefore specified.

2. The groove *b* across the face of the shoe, underneath the calk, in which to insert a tool for removing said calk, as described.

136,380.—*Mowing-Machine.*—HIPPOLYTE MICHAUX, Hockanum, Conn.

The finger-bar is rigidly attached to a frame which has a vibratory motion, said frame forming a way for a reciprocating block, which is provided with a cam-groove to operate a lever, which gives motion to the cutters.

Claim.—The swinging block to which the finger-bar is rigidly attached, pivoted, as described, to the vibrating frame *m*, in combination with the reciprocating cam-block moving in ways therein, the lever e^3, link *k*, and cutter-bar *l*, the whole constructed and operating as described, for the purpose set forth.

136,381.—*Dining-Table.*—GEORGE L. MOTTER, Bloomington, Ill.

The swinging arm has on its vertical part two lugs, which are pivoted to two legs projecting from one of the legs of the main table. The lower lug on the table-leg has a groove on its upper side, into which engages a lip or ridge on the under side of the lug attached to the swinging arm. The horizontal part of the arm has on its outer end two prongs, one of which is longer than the other. These prongs enter holes in the projection on the lower side of the auxiliary table, and hold it upright. When it is desired to fold it only the longer prong enters the hole, the other prong passing on one side of the projection.

Claim.—1. The combination of the stand C, swinging arm E, ribbed lug G, grooved lug I, and a table, substantially as and for the purpose specified.

2. The combination of the stand C, lug D, arm E, and prongs J K, one serving as a pivot and the other as a stop for the folding table, substantially as and for the purpose specified.

136,382.—*Bed-Bottom.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

The lever-springs have a projection upon the stirrup end, forming on each side a seat for the slats. The coils of the springs are behind the cross-bar and clinched upon the upper side. The slat-clasp has two buttons upon the ends of the square bar. The head-rest is detachable, and is operated by a slotted ratchet.

Claim.—1. Constructing the lever-spring with a projection upon the end of the stirrup, on either side of which seats are formed for the double slats, as described.

2. The springs with the coils behind and on a level with the cross-bar, and passing the end of the wire up through the bottom of the bar and clinching it on top of the bar, as described.

3. The spring-clasp, formed by a button upon each end of a bar, as described, and for the purposes set forth.

4. The head-rest, pivoted and keyed to the side rails, the short slats at the lower end having hooked wires clasped through slots in the main slats, and resting in gains inclosed in staples at the upper end, as described.

5. The ratchet and pawl, constructed with a guard and operating as described.

6. The combination of the slats, the lever-springs, the slat-clasp, the head-rest, and the slotted pawl, all constructed as described, and for the purposes set forth.

136,383.—*Gas-Heater.*—CHARLES H. PRENTISS, Cleveland, Ohio.

Claim.—The chambers B and E, outlet C, jet-point G, and screw-valve H, combined with the funnel I, burner J, and cup K, the several parts being constructed and arranged as and for the purpose specified.

136,384.—*Shuttle-Binder.*—FRANCIS REA, Gloucester, N. J.

In the place of the ordinary swell on the binder a spring swivel-plate is used, having a straight inner edge or side, and this inner face has a longitudinal groove for the passage of the filling-thread when the corresponding groove in the side of the shuttle becomes worn away. As the shuttle passes to the end of the box the resistance of the swivel-plate is increased. The plate is provided with flanges, which overlap the edges of the lever to which it is pivoted, and gives steadiness of movement.

Claim.—The swivel plate or stop G, provided with flanges *a' a'* and a longitudinal groove, X, in combination with the lever C, substantially in the manner and for the purpose set forth.

136,385.—*Wash-Boiler Attachment.*—CONRAD D. REINKING, Des Moines, Iowa.

The device is an ordinary framed rack, pivoted so that it can be reduced in width and increased in length, that it may be used in boilers of various sizes to sustain the clothing being washed.

Claim.—A wooden attachment for wash-boilers composed of the longitudinal pieces *a a* and the series of cross-slats 1 2 3 4, in the manner described, and for the purposes specified.

136,386.—*Device for Agitating Salt in Cruets.*—FRANCIS B. RICHARDSON, Boston, Mass.

A bar of nearly a prismatic form, the corners or angles of which are notched to form teeth or other proper-shaped points. The bar terminates at one or both ends in a cylindrical turreted head, whose outer end is concave, with the exception of a central cone or point.

Claim.—The herein-described tumbling rod or bar, composed of the barred toothed prism *a* and serrated or toothed head or heads *d*, substantially as and for the purposes stated.

136,387.—*Truss-Spring.*—JOHN W. RIGGS, Brooklyn, N. Y.

The metallic spring for a truss is coated with some substance impermeable to moisture before it is covered with rubber, which is to be vulcanized upon it. An eyelet of non-corrosive material is inserted in the screw-holes or other apertures, and clamped down upon the metal upon both sides. In this way the perspiration from the body is prevented from reaching the metal of the spring, either through cracks in the rubber or at the perforations of the metal.

Claim.—1. A metallic spring for hernial trusses, supporters, and other surgical appliances, having an eyelet, or its equivalent, of non-corrosive material, inserted into the screw-holes or other apertures and clamped down upon the bare metal on both sides, substantially as shown and described.

2. A metallic spring for trusses, &c., covered with a coating of tin or other metal not liable to rust, or of linseed-oil, varnish, japan, or other suitable substance impermeable to moisture, and inclosed in an outer covering of hard rubber, substantially as shown and described.

136,388.—*Croquet-Mallet.*—EDWARD A. ROSS, Albany, N. Y.

To the roughened and elastic handle is added a head with one-half tapered and elongated.

Claim.—1. As a new article of manufacture, a croquet-mallet in which the part B of the mallet-head is made longer than the part A, to facilitate the striking of a ball in certain difficult positions, said elongated portion being reduced in size or bulk, substantially as and for the purposes set forth.

2. As a new article of manufacture, a croquet-mallet having a handle, C, which is reduced in diameter, or made flat or thin at *c*, or thereabout, and made rough at its upper end, substantially as and for the purpose specified.

3. The herein-described croquet-mallet, consisting of a head, the parts A and B of which are unequal in length and diameter, and an elastic handle, C *c*, roughened at its upper end, substantially as specified.

136,389.—*Iron Bridge.*—WILLIAM SELLERS, Philadelphia, Pa.

The ends of the tubular bridge sections are joined without the interposition of the usual "voussoir," by forming them as cylinders whose axes are tangential to the curve at the point of juncture, the end surfaces being planed perpendicular thereto. The two end portions thus bear normally upon each other and form a continuous cylinder with a common axis, both being embraced by a two-part coupling accurately fitting them. The parts are annularly grooved for better security against strains. The trunnions serve as attaching-points for the ties, struts, and braces of the compound arch.

Claim.—1. A tubular section of a bridge-arch, constructed with the planes of its end surfaces radial to the center of the arch and with its ends formed as cylinders, the axes of which are perpendicular to the planes of the end surfaces, substantially as described.

2. The combination of two tubular sections and their coupling, substantially as set forth, so that the portion of each section embraced by the coupling and the coupling itself shall have a common axis.

3. The combination of the grooved cylindrical ends of tubular sections of a bridge-arch with the grooved clamping coupling, substantially as set forth.

4. The combination, with the coupling B B, of the trunnions or their equivalent the pin D, for the purposes described.

136,390.—*Combined Ironing-Table, Lap-Board, and Step-Ladder.*—HENRY C. SMITH, Cleveland, Ohio.

A step-ladder constructed to be reversed or laid down, to which is attached, by slides and cleats, the adjustable table, supported by a lap-board, which can be detached for use, standing upright, and held in place by upright slides and braces.

Claim.—The ironing-table D, the lap-board C, and the step-ladder A, when constructed, combined, and arranged substantially as shown and described, and for the purpose set forth.

136,391.—*Die for Manufacturing Augers.*—SAMUEL A. SMITH, Essex, Conn.

The extremity of the die is inclosed by a sharp wall, which serves to separate superfluous metal from the point, and a surrounding depression or recess is intended to receive the surplus metal thus cut off.

Claim.—In such dies, the sharp cutting projections E, for cutting the metal entirely from around the screw-point, together with the recess F, all as and for the purposes set forth.

136,392.—*Car-Wheel.*—GEORGE W. SNYDER, Port Carbon, and LEWIS W. SNYDER, Lykens, Pa.

Claim.—1. A car-wheel composed of the cast-iron rim A, the cast-iron hub B constructed with one or more channels D, and the wrought-iron tubular spokes C C, operating as receptacles of oil for lubricating the axle.

2. The combination, substantially as shown and described, of tubular spokes C, hub B constructed with channels, D, and bushing E constructed with channels F, and countersink to receive the collar G.

136,393.—*Construction of Ships.*—AMBROSE W. THOMPSON, New York, N. Y.

Hollow metallic beams run longitudinally and transversely through the vessel, and are supported at their sides and ends by hollow braces, which take the place of ordinary angle-irons. The beams and braces are connected by orifices with each other, and with the outer air by a proper outlet above deck. Double fan-wheels drive out the foul air from the tubes, and at the same time draw in a fresh current from outside, and thus ventilate the ship.

Claim.—1. The channel-boxes V H, constructed as described, and applied to the inner walls of a ship, in immediate contact with the upper and under surfaces of the decks or deck-beams, for the purposes of strengthening the walls of the vessel, supporting the decks, and ventilating the ship, substantially as described.

2. The combination of the channel-boxes V H, having air-openings, with the double system of lateral pipes B C and the exhaust and induction blowers, substantially as and for the purposes described.

3. The longitudinal boxes M N, combined with the blowers, the pipes B C, and the boxes V H, substantially as and for the purposes described.

4. The two fan-boxes K K, each containing two fan-wheels, E E', applied to the ventilation of ships, substantially as described.

136,394.—*Frame for Making Straw Envelopes for Bottles.*—WILLIAM F. TILLINGHAST, Burlington, N. J.

A hinged metallic frame with adjusting holes and pins, and a bar and hooks to hold the envelope in position.

Claim.—The hinged frames A A with bars *a a*, holes *b b*, and pins *c c*, in combination with the bar D and buckles F, as and for the purpose specified.

136,395.—*Head-Rest for Beds.*—BENJAMIN F. WALTON, Jersey City, N. J.

Two frames are hinged together at one side, and at the other sides are connected by spiral springs placed between them, forming an elastic inclined rest. Lugs are attached to the lower frame to hold the upper frame in an elevated position on one side, under a mattress.

Claim.—The combination, in a head-rest, of the hinged frames A A', springs B, and movable logs *i i*, for the purpose specified.

136,396.—*Steam Power-Brake Coupling.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.

A packing-ring is arranged in the socket part of a coupling, with one end compressed between the conical tapering faces of two bushes to make at that point a tight joint. The other end of the ring extends over the conical end of the male pipe. An open space is left around and outside of the rear end of the ring. The air passing through the pipes under pressure will exert its full force on the outside of the rear end of the ring and press it down tightly upon the joint formed by the male pipe and one of the bushes, thereby securing a tight packing.

Claim.—1. A packing-ring, *o*, arranged in the female part of a coupling, and with one end compressed between the conical tapering faces of the bushes *c'* and *i*, substantially as set forth.

2. The packing-ring *o*, not only covering but also resting upon the joint formed by the union of the male and female parts, in combination with an opening, port, or ports, *i*, leading from the main through passage-way to the outer face of the packing-ring, substantially as and for the purposes set forth.

3. A male tube or pipe, *f*, made separate from the male base-piece D, and packed at its base end by a gasket, *e*, in combination with the female part, and with the interposed packing, substantially as set forth.

4. The subject matter of the last preceding claim, in combination with valves *m m*, substantially as set forth.

136,397.—*Hose-Coupling.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.

In the shell of the coupling is a valve-box, so arranged as to form an annular space between them. In the valve-box works a sliding piston-valve having a double annular seat at its forward end, so when the couplings are disconnected the valve will fall to its seat and cover the ports leading from the passage-way near one end of the valve-case, and re-entering through passage-way back of the outer end. A packing-ring is arranged in the face of the coupling, with an air-space in the rear for the application of external pressure for seating the same.

Claim.—1. A butt-coupling for vacuum-pipes, having a valve, H, which shall, when the couplings are disconnected, fall to its seat and cover a port, ports, or openings leading from the through passage-way at or near one end of the valve-case, and re-entering the through passage-way at or back of the other end, substantially as set forth.

2. A packing-ring, *s*, arranged in the face of a butt-coupling, with an air-space in the rear thereof, for the application of external pressure in seating the same, substantially as set forth.

136,398.—*Car-Starter.*—NELSON J. WILKINSON, Kalamazoo, Mich.

Claim.—The lever E, pivoted at one end upon the pendent arms D D, secured upon the front of the car-frame, and provided with the draft and bearing chains M M, as shown, in combination with the connecting-rod H, sleeve I, pawls K K, and ratchet-wheels L L, with or without the winding-chain N, substantially as herein shown and described.

136,399.—*Clamp for Cigar-Molds.*—SAMUEL WILMOT, Detroit, Mich.

The clamp receives several molds, pressing them firmly together by means of an eccentric and lever journaled in the sides of the clamp, which is provided with a series of holes opposite each for that purpose. By pressing a large number of molds at one time and by one clamp the work is facilitated.

Claim.—The clamp A provided with a series of coincident holes, *a*, shaft B, and lever-cam C, constructed to operate substantially as and for the purposes set forth.

136,400.—*Duplex Telegraph.*—JOHN C. WILSON, Buffalo, N. Y.

Resistance in main-line circuit between main-line relay-magnet and battery. Circuit to ground always closed through resistance, signals being given by cutting it in and out of circuit by means of a shunt-circuit from main battery to line operated by transmitter M, which simultaneously closes equalizing circuit from local battery.

Claim.—1. The herein-described arrangement of circuits and resistances in a duplex telegraph, so that the signals are given by cutting the resistance in and out of the main line, substantially as and for the purpose described.

2. The resistance G, combined with the main-line magnet and circuit and main line circuit, substantially as and for the purpose described.

3. The combination, with the duplex sets of magnet T, of the main battery, resistance, transmitter-key, and the circuits F F and R R, so that the circuit R R shunts the main-battery current around the resistance, substantially as and for the purpose described.

4. The transmitter-key M, having the points *f f g g* arranged to simultaneously close the main and local equating-circuits, substantially as and for the purpose described.

136,401.—*Smoothing-Iron.*—ABEL BUCKLEY WIMPENNY, Hayfield, Great Britain.

Into the chambers within the smoothing-iron steam is conducted, through a flexible tube, from a tea-kettle or other boiling-vessel. A lower tube conducts away the water of condensation, the flow of which is regulated by a clip and set-screw. The iron has a cover of non-conducting material.

Claim.—1. The cover *d*, of non-conducting material, applied as and for the purpose described.

2. The clip *j*, hung to the upper tube and arranged to embrace and compress the lower tube, as set forth.

3. The combination, with the case *a* and its pipes *e f*, of the lid *i*, having an opening communicating through a pipe, *m*, with the pipe *e*.

4. The combination, with the case *a* and pipe *e*, of the cover *i*, having a screw, *k*, arranged as specified.

136,402.—*Splice for Railroad Rails.*—HENRY P. ADAMS, Cleveland, Ohio.

The use of a splice-piece is avoided by constructing the rail with a rectangular offset and continuation, C, which embraces the contiguous rail and follows its exact outline.

Claim.—The rails A B meeting at right angles, the rail B being provided with the arm C, constructed to closely fit the rail A from top to bottom and having the shoulder *a*, the several parts being constructed and arranged to form the splice, as described, and for the purpose set forth.

136,403.—*Guard for Harness-Hames.*—COTTON H. ALLEN, St. Louis, Mo.

A hinged guard secured to the hames protects the collar from wear.

Claim.—The hinged guard C, in combination with the hame-bar A, substantially as described.

136,404.—*Composition for Burial-Caskets.*—ALFRED N. ATWOOD, Philadelphia, Pa.

Claim.—A compound composed of asphaltum and asbestos, with or without the use of brimstone, substantially in the proportions and for the purpose set forth.

136,405.—*Piston-Packing.*—GEORGE R. BARRETT and WILLIAM A. HARRIS, Providence, R. I.

Lap-joints are employed, instead of the usual scarf-joints, in connecting the sections.

Claim.—The metallic sectional rings A, overlapping at the ends of the sections in the plane of lines radiating from the center of the piston, and with abutting ends at right angles to the overlapping surfaces, and also in the plane of radial lines, in combination with the setting-out plates C D, and so arranged as to break joints with the abutting ends and coincident overlapping surfaces of the sections, in the manner described.

136,406.—*Fence-Post.*—JAMES M. BEEBE, Canandaigua, N. Y., assignor to himself and CHARLES V. BEEBE, same place.

The lower end of a wooden post has a single slot, into which is inserted one end of a sheet-metal base, having its vertical edges bent at right angles in opposite directions, to clamp the sides of the post.

Claim.—A fence-post composed of the wooden portion A, provided with the slot *a* and the metallic base-piece B inserted therein, and provided with the fastening-flanges *b b*, resting against the front and back of the wooden post, substantially as shown and described.

136,407.—*Construction of Buildings.*—WILLIAM BESCHKE, Philadelphia, Pa., assignor of one-half his right to SAMUEL SELLERS, same place.

The continuous joints in this structure are all vertical, instead of horizontal, as in masonry courses, and the joining of each sheet-metal section is covered by the unbroken side of the section adjacent.

Claim.—1. In a structure composed of hollow sections of metal or similar fire-proof material, if used in sheet form, the equalization of the strength of the connection of the sections by covering with full surfaces joints made by the meeting ends of sheets shaped as sections, substantially as described.

2. In a building or structure composed of a series of hollow sections, the arrangement of these series so that the continuous joints are vertical and the short broken joints are horizontal, substantially as described.

136,408.—*Drill-Teeth.*—SAMUEL BLACK, West Alexandria, Ohio.

The tooth yields to obstructions by an attachment to a spring bent backward on the beam. To the spring are linked two rods, having their lower ends pivoted to studs on the upper and lower ends of a plate, which projects from the tooth and works in a slot in the beam.

Claim.—The combination and arrangement of the slotted beam A, tooth B, plate C, spring E, studs H and I, and stirrups F and G, all arranged substantially as described, for the purpose specified.

136,409.—*Cultivator.*—BALTIS F. BEATS, New Scotland, N. Y.

Claim.—1. The pickers *m m*, arranged to revolve between the wings H H, substantially as and for the purpose set forth.

2. The combination of the wheels C C, pole B, frame A with the suspended beams F F carrying the double mold-boards G G and hooping-wings H H, when all are constructed and arranged substantially as and for the purpose set forth.

136,410.—*Attachment for Sewing-Machine Tables.*—MARY A. BROWNE, Chicago, Ill.

An apron to be attached by screw-bolts and staples to a sewing-machine, extending from the machine to or near its feet and driving-shaft, constructed with means of connection and an opening for the fly-wheel, the use and object of which are to protect the operator's dress from oil and litter.

Claim.—As a new article of manufacture, a sewing-machine attachment consisting of the slotted apron B, substantially as specified, and for the purposes set forth.

136,411.—*Cigar-Bunching Machine.*—HENRY B. BUNSTER, New York, N. Y.

A reciprocating table contains the bunching recess and carries the rolling apron, and is provided with a slot in each side of its frame, through which works a stationary bunching-roller. The bunching-recess and receiving-hooks are cast solid upon the main platform. A rod and spring at one end of the apron and rod with adjusting-nuts at the other end serve to vary the tension.

Claim.—1. In a cigar-bunching machine, a reciprocating table containing the bunching-recess b^4 and carrying the apron, combined with a stationary bunching-roller, substantially in the manner described.

2. The arrangement of the grooved projection a^3, tongue or guide-bar b^1, roller D, and slots b^2, in connection with each other and with the base-frame A and main frame B, substantially as herein shown and described, and for the purpose set forth.

3. The recess b^4 and receiving-hooks b^5, formed in casting with the platform b^3 of the main frame B, substantially as herein shown and described, and for the purpose set forth.

4. The arrangement of the rod F, spring G, and adjusting-rod H with its clamping-nuts I, in connection with the frame B and slotted forward end of the platform b^3, substantially as herein shown and described, and for the purpose set forth.

136,412.—*Adjustable Valve for Bored or Driven Wells.*—MATTHEW T. CHAPMAN and MARK C. CHAPMAN, Aurora, Ill.

A valve-socket for bored or driven wells is arranged in a tube and provided with a tapering or conical base so as to be

easily moved upward or downward. Said socket has a cylindrical aperture, through which the water rises, and is closed by a spherical valve. The coupling upon which said socket is seated has a screw-thread at its lower end for attaching the strainer.

Claim.—The combination of the tube A, valve-seat B, coupling D, and packing *m*, all constructed and arranged for operation, as shown, and for the purposes described.

136,413.—*Furnaces for Reheating Metals, &c.*—HENRY CHISHOLM, Cleveland, Ohio.

The auxiliary furnace is built at one side of the hearth and connects therewith by means of a flue, forming a kind of bridge-wall, over which the products of combustion from the first hearth pass, and are supplied with additional air by means of openings in the crown of the furnace.

Claim.—1. In combination with the heating-chamber B, the auxiliary furnace A', flue J, and furnace-chamber B', substantially as and for the purpose set forth.

2. In reheating-furnaces, one or more heating-chambers or ovens, B, in combination with one or more auxiliary heating-chambers, B', and one or more furnaces, A', provided with a blast, substantially as and for the purpose set forth.

136,414.—*Means of Operating Steamboat-Chimneys.*—JOHN CHENEY, Cincinnati, Ohio.

The chimney may be raised or lowered and held at any desired angle.

Claim.—The combination of screw-threaded tube E, hinged or pivoted to the movable chimney-section B, and containing a screw, F, secured in a rocking frame, H, attached to the deck or other stationary object upon the boat or vessel.

136,415.—*Vent-Bung.*—WILLIAM F. CLASS, Cleveland, Ohio, assignor of one-fourth his right to THOS. D. COTTRELL and WM. L. B. HUGHES, same place.

The bung is provided with a removable cup for holding water over the vent during the process of fermentation. When fermentation is over the cup is removed and the bung reversed in the bung-hole, when it serves as a venting-bung.

Claim.—The bung A, rubber strip C, and thimble or cup D, when constructed, arranged, and operating substantially as described, and for the purpose set forth.

136,416.—*Barrel-Support.*—FREDERICK W. CLAUSSEN, Mars Bluff, S. C.

An upright piece of wood pivoted horisontally to transverse ears, with a cross-piece and a vertical support to rest upon, constitutes this device. The pieces are so fitted that the bottom of a barrel may be placed on them and tilted as they are moved.

Claim.—The combination of upright piece C pivoted to ears B, with cross-piece D and support E, arranged as and for the purpose described.

136,417.—*Whip-Socket.*—JOHN W. COE and DANIEL MERRITT, Williamsburg, N. Y.

Claim.—The nut E and the ribbon-spring D, applied to the disks *b' c'* of the jaws B and C, the former of which is stationary on the shaft A, and forms a stop for the latter when turned thereon, all as shown and described, and operating as specified.

136,418.—*Device for Emptying Stoves.*—BERNARD CONNELLY, Williamsburg, N. Y.

Upon the outside of the stove, near its base, are flanges serving as supports for the bent edges of a plate which slides beneath and wholly covers the ash-pit. An ash-pan is fitted beneath the stove-base in a similar manner. When the first plate is withdrawn the ashes are dumped into the ash-pan.

Claim.—A stove having a recessed bottom, with the flanges a^2 a^3 a^4, combined with the handled edge-lapped slide E, and the slotted handled pan D, resting upon the shoulders of flanges C, as and for the purpose described.

136,419.—*Police-Nippers.*—JOHN B. CRAIG and MICHAEL HAUGHEY, St. Louis, Mo.

The nippers have jaws, which may be released by a trigger, and by which the policeman can capture and secure the prisoner.

Claim.—1. Nipper-jaws provided on their pivoted ends with a series of teeth gearing with each other, as and for the purpose specified.

2. The spring-catch *s* on one jaw, C, combined with the notched other jaw on a nipper, as described.

3. The means of holding open the jaws, consisting of the spring-hook E locking with teeth *d*, as described.

4. The cap E, connected by neck *e* with handle and applied to the jaws, as and for the purpose described.

136,420.—*Apparatus for Rendering Tallow, &c.*—PETER W. DALTON, Jersey City, N. J.

The gases from the rendering-tank are conducted into the steam-jacket surrounding the tank and there condensed by water-jets.

Claim.—In an apparatus for rendering tallow, &c., the combination of a steam-pipe, K, and water-pipe L with an inner tank, A, and a surrounding chamber or space, F, substantially as shown and described, for the purpose specified.

136,421.—*Lining Rotary Puddling-Furnaces.*—SAMUEL DANKS, Cincinnati, Ohio.

The furnace is first lined with a mortar composed of lime-water and pulverized iron ore, to which soda or potash may be added. When this lining has dried a vitreous coating is formed by melting iron ore and allowing it to set while the cylinder is revolving. Successive quantities of ore are then melted in the cylinder, and lumps of refractory material introduced, which, when the bath sets, become embedded, forming projections within the cylinder.

Claim.—1. A lining or fettling consisting of the above-described compound, applied to the interior of the cylinder of a rotary puddling-furnace, and coated or covered with iron ore or other oxide or silicate of iron, as herein set forth.

2. The aforesaid lining or fettling of the cylinder of a rotary furnace, when there is fixed within said lining projecting pieces of iron ore or other suitable refractory material, as herein set forth, for the purpose specified.

136,422.—*Cotton-Press.*—JAMES P. DERDEN, Bastrop, La.

The connecting-bar is inclined to angle, and the follower is raised. The screw is revolved so as to move the truck-frame outward and bring the bar to a right angle with the lever, and the follower is forced downward with inward power. The truck-frame and the bar form a toggle-joint to operate upon the lever, while the toggle-joint is actuated by the screw.

Claim.—A cotton-press consisting of the frames A, D, and I, lever L, connecting-bar N, screw G, truck-wheels J J, and follower and bar O P, when the same are constructed, combined, and arranged to operate substantially as shown and described.

136,423.—*Bottle-Washer.*—WILLIAM DICK, New York, N. Y.

The device is operated by means of the handle on the pan T, the piston being attached to the pan. When the latter is raised water is admitted to the cylinder through the valves C; on pushing the pan down the valves close and the water is forced up through the tube G into the vessel being washed, the action of the screw giving the brush a rotary motion.

Claim.—The combination of the cylinder A, heavy base B, valves C, piston D, tube E, pan F, tube G provided with a screw-thread, *g'*, and brush H I with each other, substantially as herein shown and described.

136,424.—*Car-Axle Box.*—JAMES M. DODGE, Newark, N. J.

The journal is lubricated by means of a chain, which passes around the journal, and around a roller which rotates in the oil.

Claim.—The combination of the chain and roller with a journal, substantially in the manner and for the purpose described.

136,425.—*Wheel for Vehicles.*—JOHN L. DOM, Hamilton County, Ohio.

An ordinary wooden hub, with wooden spokes of any suitable kind, set into the hub in two rows or staggered, the rows so related to each other as to allow the ring C to be confined between them.

Claim.—1. The ring or band C C', driven or forced upon the hub between the two rows of spokes, substantially as shown and described, and for the purposes set forth.

2. The construction and use of the ring C C', of any section, placed between two rows of spokes in such a manner as to form a mutual support to the spokes, and at the same time constitute the band for the hub, substantially as set forth and described.

136,426.—*Railroad-Rail Chair.*—DANIEL D. ELDRIDGE, La Fayette, Ind.

The fastening-plate is made wedge-shaped in plan, so as to drive in and be securely held by the vertical bolt, to accommodate which notches are formed on the edge of the plate.

Claim.—A compound chair for the joints of rails, consisting of the bed-plate C and fastening-plate D, arranged in reference to each other and to the rail substantially as shown and described.

136,427.—*Lamp.*—FRANK A. FLANEGIN, Fagnadus City, Pa.

The burner is secured to the lamp-body by means of springs secured to a tubular screw passing through the central portion of the burner.

Claim.—The inner tubular screw C and springs D D, in combination with the lamp A and collar B F, provided with the groove I, all constructed and arranged as shown and described.

136,428.—*Floor-Clamp.*—JOHN J. FOSTER, Belmont, Tex.

The clamp-frame is fastened to the joist by hooks, the clamping effected by the pinion operating on the rack-bar.

Claim.—A flooring-clamp, consisting of plate A, standards B B, bolts C D, hooks D K, pinion G, slotted rack-plate E I, and clamp-screw F, arranged as and for the purpose described.

136,429.—*Gear-Cutting Machine.*—JOHN W. FOSTER, Pawtucket, R. I., assignor of one-half his right to EDWARD A. GREENE, same place.

To the base, by which the device is attached to any ordinary lathe, is swiveled a second base, carrying a slide movable by a screw; and a standard projecting upward from the slide supports, by means of a pin, the operating parts, free to be turned and set to any position in a vertical plane, while the swiveled base and slide admit of various adjustments in a horizontal plane.

Claim.—1. The combination of the base and sub-base with the operating parts, substantially as herein described.

2. The combination of the slide J and screw J' with the operating parts and the bases K and K', substantially as described.

136,430.—*Machine for Grooving Sewing-Machine Needles.*—HEINRICH FREIMUTH and AUGUST BÜTTNER, Aachen, Prussia.

The blanks are fed automatically from a series of hoppers onto adjustable and independent supports under a series of rotating saws, which cut a groove on one side of each needle. The needle-supports carry the needles in contact with and under the saws, and as it returns the needles are all turned over automatically to have grooves cut in their opposite sides. The varying depth of the grooves is determined by an adjustable pattern mechanism. Each needle is, by means of three springs, automatically clamped and released at the proper time when being operated upon, and forced from the machine when finished.

Claim.—1. The combination, as described, of the friction-disks 28, 29, and 30 with the slide 14, in the manner and for the purpose set forth.

2. The arrangement of the three bearings 2, 3, and 7 for the main spindle 1, for the purpose of preventing irregular movement of the same, in the manner described.

3. The saddles *h h* and keys *i i* and *h k* in the case 11, arranged for adjusting the needles separately, in the manner described.

4. The double cranks *u'*, arranged on the rod 68 to operate on the pins *v*, as set forth.

5. The combination of the parts 81, 82, 83, 84, 85, and 86 with each other, substantially as and for the purpose set forth.

136,431.—*Lever for Presses.*—JOSEPH P. GATES, Red River County, Tex.

A lever having a pivoted arm for holding the doors of presses.

Claim.—1. In combination with the door of a press-box, the jointed locking device, constructed as described, for the purpose specified.

2. In a locking device, the combination of lever I with its stop-flange and curved head E, and the lever G with curved head C, when pivoted together at B, said parts being arranged with relation to each other as and for the purpose set forth.

136,432.—*Machine for Turning Stone.*—ALONZO S. GEAR, Boston, Mass.

The stone, while being revolved in an engine-lathe, is operated upon by a revolving cutter-head moving parallel to the axis of the stone.

Claim.—In combination with an engine-lathe, a rotary cutter-head, studded with diamonds, for turning stone, substantially in the manner described, as and for the purpose set forth.

136,433.—*Scroll-Sawing Machine.*—GEORGE S. GRIGG, Pottsville, Pa.

An arm carrying the saw-guide is adjustably secured to the bar which supports the vibrating levers at the rear of the saw-table.

Claim.—The arm E S U, constructed and attached to the bracket or arm K, substantially as herein shown and described, and for the purposes set forth.

136,434.—*Hoop and Train Skirt.*—LOUIS GUELLE, Hoboken, N. J.

A supporting and train skirt having an open front, stayed at top and bottom, and kept from the person by an elastic cross-band.

Claim.—1. The arrangement upon the vertical edges of the open-front skirt A, and upon the opposite sides thereof, of rigid whalebone or metallic ribs or branches B B, as and for the purpose described.

2. The transverse elastic band H, in combination with the vertical ribs or branches B B and with the skirt A, substantially as and for the purpose described.

3. The horizontal hoops D D and F, placed, respectively, upon the lower and upper part of the skirt A, substantially as and for the purpose herein specified.

4. The arrangement, upon the horizontal hoop D, of the skirt A and of the transverse rigid rib G, in combination with the supplemental skirt I, as described.

5. The combination, with the skirt A, of the adjustable supplemental or train skirt I, substantially as described.

6. The hoops J J, placed upon the lower part only of the supplemental skirt I, and for the purpose described.

136,435.—*Metronomes.*—JOHN A. HECKENBACH, Mayville, Wis.

The escapement-wheel of the metronome-clock is provided with several concentric series of pins, differing in number, for tripping a bell-hammer. An index-hand is connected with a slide-piece which controls the position of the hammer-tail, so as to bring it in line with either set of tripping-pins, as desired.

Claim.—1. The escapement-wheel C provided with the pins *d* on one side and with the circles of pins *g* on the other side, as specified.

2. The combination of the pivot *a* and cams *b* with the escapement-wheel C and pins *d* thereon, to operate substantially as herein described.

3. The slide H, clapper G, and bell F connected with each other, as set forth.

4. The index-hand I having the forked arm *n* and connected with the slide H to move the same up and down, as set forth.

5. The combination of the clapper G and crank *m* with the escapement-wheel C and pins *g* thereon, substantially as specified.

6. A musical indicator provided with a bell whose strokes differ from the vibrations of the pendulum in the desired ratio, as set forth.

136,436.—*Life-Preserving Float.*—THEODORE HOSMER, Sandusky, Ohio.

A life-preserver or float, provided with propeller-blades and their operative mechanisms, consisting of ratchet-wheels, pawls, spur-wheels, and levers, the said propelling mechanism occupying no additional room when packed, and being easily transportable.

Claim.—The propeller mechanism I J, the ratchet-wheels L, pawls *m*, spur-wheels N, and levers K, combined and applied in connection with a life-preserver as and for the purpose described.

136,437.—*Apparatus for Protecting Grain and Seed.*—JEAN METHODIOS JOANNIDES, Mark Lane, London, England.

The apparatus consists of a perpendicular cylinder with eight, more or less, horizontal cylinders connected thereto, all the cylinders being perforated for the circulation of the air. A series of small tubes are placed inside of the large cylinders for the return of the confined air. The apparatus is placed in the compartment of a ship or place where the grain may be stored, with the perpendicular cylinder projecting into the open air. A funnel-mouthed cap, fitted with sponges saturated with a solution of carbolic acid for purifying the air, is attached to the top of the perpendicular cylinder.

Claim.—The combination, with the ventilator A and perforated tubes C, of chemically-prepared sponges, substantially as specified.

136,438.—*Street-Sweeper.*—ORSON W. KELLOGG, Fond Du Lac, Wis.

The frame carrying the revolving brush is swung to the hind axle of the machine, and is supported by small bearing-wheels made adjustable to afford more or less contact of the brush with the street. Pawl and ratchet wheels are provided upon the brush-axle so that the brush may always be driven by the advancing wheel in case of turning. A similar arrangement is provided for the elevator. The brush-frame can be raised or lowered from the driver's seat by chains passing over pulleys and a lever properly placed. The dust-pan can also be raised and lowered.

Claim.—1. The brush-frame D, mounted on the axle A, and gage-wheels E, and the brush geared with the truck-wheels, substantially as specified.

2. The arrangement of the lever N, cord M, pulleys L K, and chains I with the brush-supporting frame and the dust-pan, the latter being connected to the brush-frame, substantially as specified.

3. The brush and the elevator-shafts, geared at each end with the independent truck-wheels by wheels having a ratchet-and-pawl connection, *d e*, substantially as specified.

136,439.—*Photographic Negative.*—JOSEPH KIRK, Newark, N. J.

The collodion or other chemical film is applied to both sides of a glass plate, whereby (such plate being exposed to the subject to be photographed) a faint image is produced on the back in addition to the one on the front of the plate, which has the effect of blending the highest points of light gradually with the shadows in the printed photograph.

Claim.—A photographic negative, consisting of one or two glass plates, having the collodion or other chemical film applied to both sides of a plate when used singly, or to one side of each of the two plates when used together, substantially in the manner and for the purpose specified.

136,440.—*Saw-Set.*—JOHN W. LESLIE, Cairo, Ill.

A short narrow plate of metal, having a slot in the end at right angles to the handle, is firmly attached to the ferrule of a file-handle.

Claim.—The application of a saw-set, C D, constructed as shown in the drawing, to the ferrule A and handle B, as and for the purpose described.

136,441.—*Steam Vacuum-Pump.*—JAMES R. LITTLE, Monmouth, Ill., assignor of one-half his right to CLAUDIUS A. DUNN, same place.

A horizontal cylinder is divided into two chambers, each provided with a jet-pipe and a small vertical chamber for retaining part of the water when it is depressed, and this assists in condensing the steam. The steam is admitted by a slide-valve moved by a crank on a short horizontal shaft, which is operated by a tappet on a vertical shaft that is attached to the water-inlet gate and operated by it.

Claim.—1. The cylinder A, in combination with the chamber G and bottom C, when constructed and arranged for operation as and for the purposes specified.

2. The arrangement and combination with each other of the water-passages c c^2 c^3 c^4, valves *b b'*, and jet-pipes *n n'*, all constructed and operating as shown and set forth.

3. The chambers D D', in combination with pipes *n n'* provided with valves *b*, all arranged in the chambers B B', substantially as and for the purposes set forth.

4. The combination and arrangement of the gate *e*, seats *k k'* with rods *s* and operative mechanism, substantially as and for the purposes specified.

5. The combination of the spring *i*, bar *w*, rods *s* and *i*, arms *z* and *t*, and crank *r*, when arranged as described, and for the purposes set forth.

6. The combination of the valve I and gate *e* with crank *r* and rods *i* and *s*, when constructed to operate substantially as described, and for the purposes shown.

136,442.—*Machine for Making Matrices for Stereotype-Plates.*—JOSÉ ARNALDO MARQUEZ, New York, N. Y.

A revolving plate carrying spring-seated plunger-dies is mounted so as to travel in one direction over the matrix-bed, which travels in the opposite direction on rails. A die is thus brought over the proper point of the matrix, which position is shown by indicators.

Claim.—1. The type-disk E, carrying a series of type-plungers, and suspended from the spider D which travels on the guide-rods *i i*, in combination with each other and with the matrix-supporting platform and the driving mechanism.

2. In combination with the rotating and suspended type-disk carrying a series of type-plungers, and the movable matrix B, the spring-stop *r* for engaging with the pockets *p* of the type-disk, substantially as described.

3. The index *s* and traverse *u*, in combination with the hand-wheels *g m* and their indicators, as set forth, for operation in respect to the movable matrix-bed and the suspended and rotating type-disk E, as and for the purpose specified.

136,443.—*Bureau or Wardrobe Bedstead.*—CHRISTIAN MAY, Cincinnati, Ohio.

The top of the bureau is hinged to the back, being held to the proper position by a prop. From the left hand of the bureau a shelf is drawn out, which forms, with the permanent shelf in the

bureau, a receptacle or frame for the open mattress. The false drawer-front at the top can be let down in front of the bed. A hinged bracket swings out under the bed-shelf to support the same when extended.

Claim.—1. The described arrangement of shell A, hinged top E, prop F, extension G, and hinged bracket H, for the purpose set forth.

2. In combination with the elements of preceding clause, the flap D *d*, hook K, and eye L.

136,444.—*Machine for Making Plow-Irons.*—JAMES M. MCGINTY and THOMAS NOLAN, Moulton, Tex.

The plow-iron is cut from a sheet of metal by punching-dies. As one blank is cut off the plate it leaves another partly formed, which is cut off by the ends of the dies when the upper die descends to punch another iron from the plate. The blank which is punched into the lower die is raised by spring-levers to a level with the plate, which pushes it away as it is fed along.

Claim.—1. The combination of the driving-shaft B, driving-wheel C, segmental gear-wheel D, gear-wheel E, feed-roller gear-wheels G I, feed-rollers H J, crank or crank-wheel Q, and connecting-rod P, with each other and with the dies M N, substantially as herein shown and described, for the purpose of operating said dies and feeding the bar or plate to them, as set forth.

2. The dies M N, provided with punches R, spring-bars S T, and stops U V, substantially as herein shown and described, and for the purpose set forth.

3. The method of cutting the plow-bars from the bar or plate to avoid waste of steel and enable one set of dies to cut two plow-bars at each operation, as set forth.

136,445.—*Apparatus for Cooling Liquids, &c.*—HEINRICH MEIDINGER, Carlsruhe, Germany.

The vessel which holds the substances to be cooled is surrounded by a double-wall ring having perforations in its inner wall, and constructed with a projecting flange at its upper edge, so arranged as to rest upon the top of the vessel, holding the ice or other cooling agent.

Claim.—1. The double ring and sieve C, arranged substantially in the manner and for the purpose set forth.

2. The vessels A, B, and C, combined with each other, substantially as herein shown and described.

136,446.—*Process for the Manufacture of White Lead.*—ASA P. MEYLERT, New Britain, Conn.

Passes the carbonic-acid gas directly through the acetic acid so as to compel a partial vaporization of the acid, and to carry over into the corroding-chamber only so much as can be economically used, preventing the loss which occurs when the acid is vaporized by direct heat.

Claim.—1. The method of vaporizing acetic acid or its equivalent by passing carbonic-acid gas in contact with the same, substantially as above described.

2. The combination of the pipe *y*, conveying carbonic-acid gas into, and terminating in, the receptacle B, the acid-receptacle B, the corroding-chamber A, and their connections, substantially as and for the purpose set forth.

3. The combination of the purifier C, the acetic-acid receptacle B, the corroding-chamber A, and their connections, substantially as and for the purpose set forth.

4. The combination of the pump or blower D, the purifier C, the acid-receptacle B, the corroding-chamber A, and their connections, substantially as and for the purpose set forth.

5. The combination of the furnace for generating the carbonic-acid gas, the washer E, the acid-receptacle B, the corroding-chamber A, and their connections, substantially as and for the purpose set forth.

6. The combination of the furnace for generating the carbonic-acid gas, the washer E, the pump or blower D, the acid-receptacle B, the corroding-chamber A, and their connections, all arranged substantially as and for the purpose set forth.

7. The combination of the furnace for generating the carbonic-acid gas, the washer E, the pump or blower D, the purifier C, the acid-receptacle B, the corroding-chamber A, and their connections, arranged substantially as and for the purpose set forth.

136,447.—*Artificial Food.*—HARRY CROSWELL MORRIS, Richmond, Va., assignor to THOMAS H. HAZARD, same place.

Lean meat, together with the digestive organs of an animal, is macerated till reduced to a pulp, and then there is added muriatic acid, glycerine, and water, and the mass is subjected to heat of 120° Fahrenheit. After this all liquid is extracted, and any free acid is neutralized by carbonate of soda.

Claim.—1. The article of artificial food, substantially as herein described.

2. The application of the digestive organs of an animal in the production of artificial food, substantially as described.

3. The process for the production of artificial food, substantially as described.

136,448.—*Combined Latch and Lock.*—GAORG MÜLLER, New York, N. Y.

The bolt is connected to the knob-spindle, and operated as a latch by means of a slotted link pivoted to the bolt and a pin on the arm of the hub or collar through which the spindle passes. The slot in the link allows the bolt to be thrown forward by the action of the key, and there held by the tumblers when it is desired to lock the bolt. By this arrangement the same bolt is used as a latch or lock, as may be desired.

Claim.—1. The sliding bolt M, spindle L *l*, collar P, slotted link N, stops I, spiral springs K, tumblers Q, and post V, combined, arranged, and operating as set forth.

2. The rose W, escutcheon X, and pipe Y, cast in one piece, either with or without the spline Z and groove Z′ in the key T, substantially as and for the purposes described.

136,449.—*Pessary-Adjuster.*—OTHO M. MUNCASTER, Washington, D. C.

A rod, with a ball or ring attached, is joined to another rod by slots and a set-screw, so that the former is adjustable upon the latter both vertically and laterally. Parallel with the main rod, and hinged to it at one end, is a strip of lead or zinc, which, when forced against the external genitals, retains the configuration of the parts. The rods give the length of vagina and exact curve, so that after this adjuster is removed a pessary may be at once bent to the exact shape required in any case.

Claim.—1. The combination of the rod D for insertion into the vagina, and part B upon which it adjusts both vertically and laterally, all arranged as for the purpose described.

2. In combination with the parts B and D, the flexible piece H, hinged or fastened thereto for taking and retaining an impression of the external genitals, arranged as shown.

136,450.—*Tool-Holder.*—IRA F. MURCH, Sumner, assignor of one-half his right to DAVID TORREY, Deering, Me.

Various tools are fitted in sockets in the disk, which, by its shank, is rotated in an ordinary brace.

Claim.—The improved tool-holder, as shown, consisting of the shaft *a*, pivot *d*, disk *e*, recesses *e e e*, chambers *h h*, catch or detent *f*, thumb-latch *g*, and spring *m*, or their equivalents, when constructed and arranged substantially in the manner and for the purposes as set forth.

136,451.—*Fire-Kindler.*—CHARLES A. NISBETT, Pontiac, Mich.

Claim.—1. The end-curved plate A, provided with spring *a* at one end, the spring *g* at the other, and the intermediate post *b*, as and for the purpose described.

2. The pendent plate *d*, arranged in the post *b* to operate in combination with the lever C and spring *g*, substantially as specified.

136,452.—*Water-Wheel Attachment for Sewing-Machines.*—CHARLES H. PALMER, New York, N. Y., assignor to A. M. LORYEA, Portland City, Oregon.

The water-wheel is inclosed in ordinary casing, and made with two metallic disks struck up by a die and united in any convenient manner. The casing as shown is made to fit close to the wheel, both in front and rear of the point at which the water strikes, for the purpose of preventing the escape of water backward. There is a feed-water pipe; also a place of exit. A lever is affixed to the axis of an ordinary water-faucet, by which the water is let in or shut off, and a dial with degrees marked thereon, representing the comparative quantity of water required, is also connected with the wheel.

Claim.—1. The wheel *a*, constructed substantially as described.

2. The index-dial *g* and water-faucet, in combination (or equivalent devices) with the wheel *a* and casing *b*, substantially as described.

3. The casing *b*, made to fit close to wheel *a* in front and rear of the point at which the water strikes the wheel, as set forth.

4. The circular disk *m* to prevent leakage, as set forth.

5. The brake A, in combination with the water-wheel shaft, operated substantially as and for the purpose described.

136,453.—*Sectional Steam-Boiler.*—HENRY B. PANCOAST and FRANCIS I. MAULE, Philadelphia, Pa.

By fitting one end of the large and small pipes into distinct return bends, and the other end into rings, the sections can be readily bolted together to increase or decrease the size of the boiler.

Claim.—1. The arrangement and combination of the tubes H A′, the return bends K, and the rings N P, bolted together, as and for the purpose herein described.

2. The arrangement and combination of the tubes H A′, the return bends K, the manifolds composed of the rings N P bolted together, and the circulating pipes R, operating so as to form a sectional steam-boiler, as herein described.

136,454.—*Check-Loop for Harness.*—WILLIAM PARSONS, Palmyra, N. Y., assignor of one-half his right to WILLIAM B. BROWN, same place.

A metallic frame with open sides secures the strape by a pin, which forces the straps through the openings.

Claim.—The check-loop, consisting of the skeleton block C and the pin D, constructed, arranged, and operating as herein described.

136,455.—*Machine for Upsetting Tires.*—CHARLES J. PETERSON, Brevard Station, N. C.

The bed is made solid with the vertical stands, and the serrated jaws are made with a vertical lip to keep them in place. The wedges over them not only clamp them upon the tire, but serve to prevent their lateral movement when the tire is being hammered.

Claim.—The combination of the serrated movable jaws F F having the vertical lips G, with the transverse wedge bars or keys C C inserted through the vertical slots of the stands B B, and the jaws E E formed on the bed-plate A, all as shown and described, for the purpose specified.

136,456.—*Mosquito-Net Frame.*—NICOLAI PETERSEN and ROSA ROESCHER, Memphis, Tenn.

A frame connected at its center by a hinged holder in two parts, having on its under side a bolt to sustain it when extended, and from which the top of the frame is connected, and from it extends to the corner bracket or elbow, constructed with one branch extending downward, from which is connected the slide which enters the upper end of the upright, and is held in position by a spring-bolt, by which its height can be adjusted, and all the parts supported by a cord passing through the elbow or bracket and around the frame. By the arrangement of the hinged center the entire frame can be folded into a small space for transportation.

Claim.—1. The top center-piece A, provided with hinges *b*, bolt *p*, and connecting-pieces *a*, as set forth.

2. The corner-piece *f*, in connection with arms *e*, string *k*, and legs *l*, as described.

3. The notched legs *l*, in connection with springs *i* and tubes *m*, as set forth.

4. The combination of the parts of the former clauses, forming the portable mosquito-net frame, substantially as and for the purposes described.

136,457.—*Tobacco-Pouch.*—DANIEL READ, New York, N. Y.

An inner pouch of water-proof material is provided with a metallic frame, and arranged between the pockets of a wallet.

Claim.—The combined tobacco-pouch and wallet, composed of the pouch A, made of rubber or other suitable water-proof material, and provided with a metallic frame, B, and the pockets C of a wallet arranged upon one or both sides of said pouch, substantially as herein shown and described.

136,458.—*Hand-Stamp.*—GEORGE H. ROUNTREE, Milwaukee, Wis.

The stamp is hung in a lever which is oscillated to alternately ink the type and print its impression. During the latter movement the ink-pad is partially rotated by a pawl-and-ratchet movement.

Claim.—The combination of the swinging stamp revolving ink-pad, stamping-pad, and the pawl and ratchet, substantially as specified.

136,459.—*Hub for Vehicles.*—THEODORE ROYER and GEORGE L. ROUSS, Cincinnati, Ohio.

Claim.—1. The combination of metallic flanges slightly beveled at the angle E with wedges formed with a projecting lip at each end of the lower edge, substantially as and for the purposes specified.

2. The combination of metallic flanges beveled on the side next the spoke and toward the hub with wooden wedges whose edges are beveled as described, substantially as and for the purposes set forth.

136,460.—*Manufacture of Carriage-Axles.*—ALEXANDER SCHIECK, JOSEPH SCHIECK, and JOSEPH SMITH, Rochester, N. Y.

Claim.—The method herein described of applying and forming the collars of carriage-axles—that is to say, nicking the corners of the square bar A, bending the strap B around it at the point nicked, and then welding said strap to the bar, and drawing out and forming of said strap the extended or double collar *n o* by means of dies, as set forth.

136,461.—*Sash-Balance.*—JOSIAH M. SIMPSON, Oshkosh, Wis.

An automatic spring-clamp is formed by arranging a bent-wire spring on each side of a dog, journaled in suitable bearings, the spring curving around the heel of the dog so as to leave a small space for the cord to pass between the heel of the dog and the inside of the curve in the spring. The ends of the spring are secured in the base-plate. There are also projections, one on each side of the dog, to prevent the spring from slipping over it; and a groove is formed between the nose of the dog and that part of the base on which it rests, through which the cord passes, is held automatically by the spring, and released only by pressure on the thumb-piece.

Claim.—The spring-clamp composed of the dog D journaled in bearings F F, and held and operated by the spring G, which curves around the heel of the dog D, and terminates in the base H, substantially as and for the purposes hereinbefore set forth.

136,462.—*Steam and Air Brake.*—BENJAMIN W. SMITH and ERASTUS O. FRINK, Indianapolis, Ind.

Claim.—1. The combination of the two cylinders C^1 and C with suitable valves and pipes, when one cylinder is larger than the other and used as an air-compressor, substantially as and for the purpose set forth.

2. The combination of the two cylinders C^1 and C, with their several valves and connections, with the reservoir B, substantially as and for the purpose set forth.

3. The combination of the several working parts, as specified, with the two cylinders C^1 and C, substantially as and for the purpose hereinbefore set forth.

4. The combination of the steam-pipe A^1, provided with a four-way cock, B^2, and connected with the air or steam pipe 7, with the brake-cylinder K^2 and exhaust-pipes J^2 and J^3, substantially as and for the purpose set forth.

5. The four-way cock C^2 or B^2, when constructed and operated substantially as and for the purpose set forth.

6. The brake-cylinder K^2, provided with one or more grooves, N, at the bottom of the cylinder, substantially as and for the purpose set forth.

7. The combination of the trip Y^2 of the coupling, provided with a projection on each side of the lower end, and the hinged joint Y^3 on the sockets E^2, with the sleeve D^2 and disk-valves O O′, substantially as and for the purpose set forth.

8. The cock-coupling K^3, provided with a key, K^4, and handle K^5 that is hollow, in combination with either of the pipes 7 or J^2, substantially as and for the purpose set forth.

136,463.—*Process and Apparatus for the Manufacture of Carbonate of Soda.*—ERNEST SOLVAY, Brussels, Belgium.

The absorber is a vertical cylinder from thirty-five to fifty feet in height, divided by perforated plates. The liquid is supplied to the absorber at mid-height from a reservoir situated ten feet below the top of the absorber. An equalizing-pipe connects the top of absorber and reservoir. The carbonic-acid gas is forced in at the bottom of the absorber at a pressure exceeding that of the liquid column.

Claim.—1. Forcing carbonic-acid gas obtained from any convenient source through a high column of a solution of salt and ammonia, the height of which always exceeds and is generally several times as large as its greatest width, and so make the liquor descend and the gas ascend mainly in a vertical direction, by which means a very active reaction is obtained, and a complete prevention of the heating of the liquid.

2. The use of a single vessel of considerable height in proportion to its width, hereinbefore called "absorber," for treating the solution of salt and ammonia by carbonic acid.

3. The use of plates perforated with small holes and provided with teeth round their circumference in the said absorber, in order to divide the gas as often as practicable.

4. The peculiar form of calotte or globular segment given to these plates.

5. The use of plates provided with one or a few large holes in the said absorber to prevent the mixing of the liquor at the bottom and top of the said absorber.

6. Feeding the liquor into the absorber at about half of its height, for obtaining the liquor in the upper half of the absorber in a fit state to retain the ammonia carried off by the gas from the lower half of the absorber.

7. The use of a vacuum-filter for separating the bicarbonate from the liquid.

8. The drying of the bicarbonate and its conversion into monocarbonate of soda with the same filter by passing a current of air or other gas through it.

9. The drying apparatus, consisting of a cylinder in which are placed circular shelves with proper openings, and which is provided with shaft-arms and scrapers, which cause the drying substance to move from the top to the bottom of the cylinder, for the purposes herein before set forth.

10. The use of hollow shelves heated internally in the said drying apparatus.

11. The drying apparatus, consisting of a hood provided with a central shaft, arms, and scrapers, for the purposes hereinbefore set forth.

12. The regeneration of the ammonia from the liquid from which the bicarbonate has been separated by magnesia or a basic chloride of magnesium, and the subsequent treatment of the liquid thus obtained, by which muriatic acid or chlorine is obtained, and the magnesia, as well as all the salt which has not been converted into bicarbonate, are recovered.

136,464.—*Steering Apparatus.*—JOHN F. SHARE, Rochester, N. Y.

A balanced rudder is pivoted at its lower end in a step, as usual, but its upper bearing consists of a hollow spindle, through which the driving-shaft of the propeller is connected by mechanism with the motive power, so that while the bearing of the propeller-shaft is in the rudder itself the rudder may be operated independently of the propeller while in motion.

Claim.—A balanced rudder, B, suspended on hollow upper pivot *a* and lower step-pivot *b*, and receiving shaft D of propeller, as and for the purpose described.

136,465.—*Electro-Magnetic Annunciator.*—GEORGE W. SHAWK and ALBERT STORER, Cleveland, Ohio.

The steel disks or plates bearing the indicating-numbers are permanently magnetized, and thus attach themselves normally to the soft-iron cores of passive electro-magnets. When the signal-key is touched, completing the electric circuit through the electro-magnets, exciting their poles to similar states with their contact plate-magnet, the latter is repelled, and thus drops into view at the same time that a bell is sounded by another electro-magnet.

Claim.—1. The polarized magnets D D, when arranged with the electro-magnets C C, or their equivalents, for indicating numbers, substantially as described, and for the purpose set forth.

2. The said polarized magnets D and electro-magnets C, in combination with the electro-magnets G G, lever H, hammer K, and gong L, arranged for sounding a signal, substantially as shown and described, and for the purpose set forth.

136,466.—*Medicated Towel.*—LYDIA STEWART, San Francisco, Cal.

Beef's gall, saltpeter, Cayenne pepper, common salt, arnica blossoms, water.

Claim.—1. A medicated towel, for the purpose above described.

2. The combination of ingredients above mentioned, substantially as and for the purpose above described.

136,467.—*Cooking-Vessel.*—WILLIAM Y. THOMSON, Oyster Bay, N. Y.

The cover will be held securely in place while the water is being poured from the solid contents of said boiler, and the contents of said boiler may be "tried" to see if they are fully cooked, without its being necessary to remove the cover for that purpose.

Claim.—1. The cover B made with the perforations b^1, the notches b^2, and the hole b^3, and provided with the handle D and flaps C and E, substantially as herein shown and described, to adapt it to be applied to a vessel provided with the shoulder or flange a^1 and stops a^2, as and for the purpose set forth.

2. The bail H and inclined lugs G, constructed and applied to a vessel provided with an ordinary bail, F, substantially as herein shown and described, and for the purpose set forth.

136,468.—*Cartridge Made of Fusible Metals, &c.*—WILLIAM HENRY TOOTH, Brixton, England.

The object is to form cartridges of easily-fusible metals, either alone or combined with other combustible matters, so that the shell will melt or burn up and be blown from the gun.

Claim.—1. Constructing cartridge-shells of fusible metals, whether formed in one piece with the projectile or separately attached thereto, as herein set forth.

2. Ignitible or inflammable cartridge-shells formed of the ingredients specified, or their chemical equivalents, substantially as set forth.

3. Explosive cartridges formed of the ingredients and in the manner herein described.

136,469.—*Carpenter's Plane.*—JUSTUS A. TRAUT, New Britain, Conn.

Combined plow, dado, and rabbet-plane, made adjustable by a removable and reversible guide-bar.

Claim.—1. The combination of the stationary stock *a* with the adjustable stock *a'*, when the latter is provided with the boss *b*, substantially as and for the purpose specified.

2. The detachable and reversible guard-plate *n*, when used in combination with the stock *a* and adjustable stock *a'*, substantially as and for the purposes specified.

136,470.—*Apparatus for Treating Alcoholic Liquids in Spray with Ozone for Aging and the Production of Vinegar.*—REUBEN D. TURNER, New York N. Y.

Claim.—The combination, with the tank A, of the separate ozone-receptacle C, the vessel G containing the liquid to be treated, the pumps D F, the closed trough or receiver E, into which both the liquid and ozonized air are pumped, and the spraying tubes or devices H for distribution of the liquid by pressure of the ozone and in common with it within the tank, substantially as specified.

136,471.—*Ironing Apparatus.*—ROLLA A. TYLER, Haverhill, Mass.

A post is attached to a table, and to the post is hinged a standard having a horizontal arm and an upright standard. At the upper end of this is an arm having a metallic rod; one end of this rod is bent, and one end fits in a socket in a smoothing-iron. A spring extends from the standard to the arm, which causes a pressure upon the smoothing-iron when moved by the operator over the ironing-board.

Claim.—1. A spring, in combination with the hinged arms G and D, when employed to press the flat or smoothing iron on the material, as specified.

2. The device for ironing or smoothing materials, consisting of the post B, the hinged standard C, the horizontal arm D, the upright standard E, the pressure-arm G, the spring H, and the rod I, operating as herein before described.

136,472.—*Car-Axle Box.*—STEPHEN USTICK, Philadelphia, Pa.

A close oil-chamber is formed below the journal in the axle-box by means of a division-plate, which is adapted to receive packing around its edge. Oil is conveyed to pads, which are inserted at the sides of the journal by wicks which pass down by the sides of the division-plate.

Claim.—The detachable division-plate D, provided with packing *b*, in combination with the journal-box A, substantially in the manner and for the purpose set forth.

136,473.—*Manufacture of Coil-Springs.*—WILLIAM HENRY WARD, Auburn, N. Y.

A single spring-wire having its two ends coiled in the same direction and in such a manner as to balance each other throughout.

Claim.—The coil spring *a b c d*, having its coils *a b* and its ends *c d* so arranged as to perfectly balance each other and allow of formation into right-and-left springs, as described.

136,474.—*Washing-Machine.*—CYRUS WATSON, White Cloud, Kans.

A washing-machine constructed with inclined bottom from the center, with a smooth roller with cross-bars in close connection with it, with a fluted roll attached to hooks, which extend from the journal to a spring, and attached to and across the bottom, by which the rolls are held in connection, through which the clothing to be washed is passed.

Claim.—The combination of tub A having bottom inclining downward from the center, the smooth roller U arranged between overlapping cross-bars E E and journaled in notched blocks D D, the fluted roll F having crank G and arranged in open slots of blocks D, and the spring-connected rods I H, all applied together as and for the purpose described.

136,475.—*Propelling Mechanism for Vessels.*—JOHN WELCH, New York, N. Y.

Vibrating paddles are pivoted in an oscillating frame, and curved or bent rods extend down on each face of the paddles to limit them in the direction of their motion to act as stops.

Claim.—In combination with the paddles I, pivoted in a vibrating frame, the rods L L, bent or curved, as specified, whereby they are adapted to act as stops, alternately, for said paddles.

136,476.—*Lasting Boots and Shoes.*—JOSEPH C. WIGHTMAN, Boston, Mass.

After securing the projecting edges of the vamp to the inner sole by the application of glue or other adhesive composition, a binder of thin suitable material is spread over the entire sole surface and secured by the same process.

Claim.—In the process of lasting a boot or shoe, the combination of the inner sole D with the vamp B and the binder A, when said binder A is used as a part of the shoe distinct from the outer sole, for the purpose set forth, substantially as described.

136,477.—*Cultivator.*—WILLIAM WILLERTON, Jacksonville, Ill.

Devices for raising and lowering the plows.

Claim.—The combination of rack-bar U, bibranched chain P S, pulley T, laterally-sliding pulleys Q Q, and keeper V, all arranged as and for the purpose described.

136,478.—*Pump-Nozzle.*—CHARLES O. WILSON, Columbia, Ohio.

The nozzle is made in two parts, which are connected by a pivot. A spring connected at one end to the pump-stand and at the other to the pivoted part of the nozzle or spout throws up the latter when it is not in use, and the drip is conveyed from the chamber in which it falls through a pipe back into the reservoir.

Claim.—The adjustable pump spout or nozzle in two sections or parts, connected at and working on a pivot, in combination with the cavity, slot or opening, shield, drip-pipe, and spring.

136,479.—*Die for Shaping Hatchet-Blanks.*—JONATHAN YERKES, Frankford, (Philadelphia,) Pa., assignor to YERKES AND PLUMB, same place.

The portion of the die that strikes the side of the eye is formed slightly convex, and the part that operates on the back or hammer end of the hatchet has projecting lips that embrace the edges of the blank and form it octagonal in cross-section.

Claim.—The dies A B, each provided with a convex portion, *c c*, and lips *b*, constructed substantially as described.

136,480.—*Knitting-Machine.*—JOHN M. ARMOUR, Syracuse, N. Y.

The cams, in the order in which they are marked, operate to bring the hooks in position to be entered by the needle, to recede to allow the needle to pass down between the hooks, to move the frame forward so that the loop shall be caught by one of the hooks, and to move the hook-carrier so that the needle shall come out behind the hook on which it left a loop and then be fed forward for another stitch. The feeder draws down the loops as formed.

Claim.—1. The cam-wheel, provided with the cams Nos. 4 and 5, operating in connection with cams Nos. 1, 2, and 3, substantially in the manner and for the purpose specified.

2. The cam-wheel having the cams herein described and the fixed or adjustable gate *g* between cams Nos. 1 and 5, substantially as and for the purposes set forth.

3. The feeder G, when operated in connection with the needle or needles and stitch-hooks, substantially as described.

136,481.—*Brick and Tile Machine.*—GOODRICH BALDWIN, Monroe, Mich.

The clay is fed in by a belt, and manipulated and worked forward by hoes or knives (operated by pitman and cranks) to the plunger, which drives it through the die.

Claim.—1. The pitman E, carrying the hoes G G and plunger I, and operated by means of the two cranks D D, substantially as and for the purposes herein set forth.

2. The flange *a*, attached to or formed on the plunger I, and operating, in connection with the die H, substantially as and for the purposes herein set forth.

3. The cleaner J, consisting of the bottom pieces *b b* and side pieces *d d*, and operating, in connection with the hoes G G and the friction-rollers described, substantially as and for the purposes herein set forth.

4. The combination of the cranks D D, pitman E, hoes G G, plunger I with flange *a*, die H, cleaner J, belt *f*, and stop-chain *e*, all substantially as and for the purposes herein set forth.

136,482.—*Door and Gate Spring.*—SILAS L. BEAN and LUCIEN MILLS, Galesburg, Ill., assignors to BROWN, HARRIS & HOPKINS, New York, N. Y.

The plug which is used to retain the coil-spring and adjust the same in its bracket is furnished with a prismatic end, which is inserted in a mandrel. The end of the wire can thus be permanently secured in the plug where it is intended to remain, the mandrel inserted, and the spring coiled in the lathe. It is only necessary to remove the mandrel, when the spring is ready for use. A nut on the lug below the bracket, and above a collar or ridge, affords a secure hold for a wrench in tightening the spring for use.

Claim.—1. A coiled door or gate spring with its plug constructed with a prismatic terminus, *t*, which permits it (the plug) to be attached to a movable mandrel during the coiling of the wire into a spring, substantially as described.

2. The collar *c*, in combination with the nut *s* and the shoulder formed by the bracket B, whereby the spring described can be adjusted by a wrench without any liability of the wrench slipping off the nut by an upward or downward movement.

3. The plug C, inserted into the upper end of the spring, and made with a prismatic terminus, *t*, with a collar, *c*, a nut, *s*, and a channeled stem, *d*, all substantially as and for the purpose herein described.

136,483.—*Shipping Mechanism for Machinery.*—FREDERICK N. BIXBY, West Meriden, Conn.

Under the movable journal and supporting-frame is fitted the tumbling-block, which, when the box is moved out of gear, is carried from an inclined to a vertical position, causing the journal to be raised off the supporting-frame.

Claim.—1. The tumbling plate or block A, fitted under the movable box *f* of the shipping mechanism for elevating said box during the shipping movement, as set forth.

2. The combination of the set-screws *f f* with the movable box *f* and tumbling-plate A, substantially as specified.

136,484.—*Refrigerating Apparatus for Vessels, Railway Cars, &c.*—WILSON BRAY, Lambertville, N. J.

A series of refrigerating chambers are arranged with one or more ice-boxes above, which are provided with passages and doors, so that a constant circulation of air may be kept up through a part or through the whole of the refrigerating-chambers, as may be desired.

Claim.—1. The combination with a vessel or other structure of refrigerating apparatus, consisting of a series of refrigerating-chambers, one or more ice-boxes, and passages, all arranged and communicating substantially as described, so as to create and maintain a circulation of air through any or all of said chambers, passages, and boxes.

2. The combination of the said refrigerating apparatus with a fan-blower or other equivalent pneumatic apparatus, for maintaining a forcible circulation of air through the ice-box, passage, and chamber, in the manner described.

3. The combination, with the trough F, of a rope or chain, G, having disks *m m*, or their equivalents.

4. The combination of the refrigerating-chamber, ice-box communicating with the chamber at the top, and the passages H, all as set forth.

5. The combination, with the ice-box, chamber, and passages H, of the passage I, as specified.

6. The combination of the drip E, its shoulders, and flanges with the sides of the ice-box.

136,485.—*Centrifugal Machine.*—CARL T. BURCHARDT, New York, N. Y.

A feed-screw is arranged centrally within the bottomless basket, and is fitted closely to the inside of the same. This screw revolves with a speed sufficiently different from the basket as to cause a screwing or scraping motion relatively to it in a downward direction, so that the substance to be drained is fed in at the top of the basket, and is forced downward through the same by the action of the screw, and is delivered at the bottom of the machine from whence it is removed by a suitable elevator.

Claim.—1. The revolving screw or spiral-shaped scraper inside of a conical or cylindrical basket of a centrifugal machine for the continuous working of the same, substantially as described.

2. The combination of a bottomless basket and screw or spiral shaped revolving scraper within it with a hopper and conveyer, substantially as described.

3. The sleeve like body L fitting loosely on shaft C with a spiral or screw shaped scraper, substantially as described.

136,486.—*Apparatus for Moving and Rolling Hogsheads and Heavy Barrels.*—FRANCIS O. J. BURR, Brewer, Me.

A lever provided at its inner end with a cross-head to rest upon the barrel. To this lever, at a suitable distance from the cross-head, two arms are jointed, each of them at its outer end being hooked, and each hook being provided with a projection or bearing. To these hooks claws are pivoted to grasp the barrel at the end of the staves.

Claim.—1. The lever A, its hooked arms C C, and claws *d d*, combined and arranged as and for the purpose substantially as described.

2. The lever A, its cross-head *a*, hooked arms C C, and claws *d d*, combined and arranged as explained and shown.

3. The trig or chock, composed of the bar E and the yoke F, whether the latter be made of one entire rod or of two applied together, substantially as explained.

4. The arrangement and combination of the projection *e* with the lever A, the hooked arms C C, and the claws *d d* thereof.

136,487.—*Cigar-Shaped Pipe.*—STEPHEN N. BUTMITSKY, Washington, D. C.

A tube or case is provided with a mouth-piece capable of rotation, and a suction-tube perforated at its front end, extending from the mouth-piece nearly to the front end of the case, the suction-tube being provided with a spiral flange to feed fresh tobacco forward, and with an enlargement or cooling-chambered barrel near the mouth, which can be partially or wholly removed when in use for contact with the air.

Claim.—1. In combination with the tube A and rotating mouth-piece B, the tube D provided with a spiral flange, F, substantially as and for the purpose set forth.

2. In combination with the tube A, suction-tube D, and mouth-piece B, the hollow boss C, wholly or partially removable from the case A while in use, to form a cooling-chamber, as described, within which may be placed suitable filtering or fragrant substance, as set forth.

3. The mouth-piece B, hollow boss C, tube D with spiral flange F, and ring E, constructed and connected as set forth, so as to be easily revolved and removed from the tube A, for the purpose described.

136,488.—*Tanning.*—JOEL CARTER and ALANSON KEITH, Jersey City, N. J., assignors of one-half their right to JAS. L. BALDWIN and LEVI DEDERICK, same place.

Sal soda, carbonate of potash or common lye, prussiate of potash or nitrate of potash, or nitrate of soda, sugar of lead, sulphate of iron, common salt, and lime for a depilating solution. Common salt, sulphuric acid, spirits of turpentine, japonica, soft soap, for a tanning solution.

Claim.—1. A depilating solution composed of the ingredients set forth, or their equivalents, with or without common salt, in substantially the proportions named.

2. A tanning solution composed of the ingredients, with or without soap, in substantially the proportions herein set forth.

136,489.—*Hydraulic Valve.*—THOMAS CRITCHLOW, Baldwin, Pa.

Water enters right-hand cylinder, and passing through apertures in hollow piston is forced through the upper pipe to machine. By depressing the plunger until its apertures are coincident with stuffing-boxes cast within the cylinder the operation of the machine is suspended with the cutting off the water, which enters the inclosing-chamber.

Claim.—1. The hollow piston K, closed at both ends and provided with perforations *d* and *e*, substantially as and for the purposes herein set forth.

2. The cylinders A A', connected by pipe B C, and each provided with stuffing or packing boxes G G, to form interior compartments H, H^1, and H^2 in each cylinder, substantially as and for the purposes herein set forth.

3. The combination of the cylinders A A' with connecting-pipes E C, inlet D, outlet E, and interior boxes G G, and the hollow pistons K K, closed at both ends, and provided with perforations *d e*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

136,490.—*Process of Treating and Drying Cigars.*—JAMES CUDDY, Pittsburg, assignor to himself, EDWARD A. KITZMILLER, same place, and JOHN J. MCDERMOTT, Allegheny, Pa.

Places the formed cigar upon racks in a close chamber or box, and puts a layer of chloride of calcium either above or below the racks.

Claim.—The process herein described for drying the manufactured cigar—viz., abstracting the moisture from the cigar by chloride of calcium or its equivalent placed in a closed chamber together with the cigars.

136,491.—*Banjo.*—HENRY C. DOBSON, New York, assignor to HERMAN SONNTAG, Stapleton, N. Y.

To draw the head up tight a series of small grooved blocks are held upon a presser-hoop by screws passing through them and taking into the edge of the main body of the instrument.

Claim.—The combination of the grooved clamp D and screw E with the head B, ring or hoop C, and frame or rim of a banjo, the latter being provided with an outwardly-projecting shoulder or shoulders, *g*, substantially as and for the purposes herein specified.

136,492.—*Jelly-Tumbler.*—WILLIAM DOYLE, Birmingham, Pa.

A sheet-metal cap is applied to a glass tumbler.

Claim.—1. A jelly-glass adapted for the reception of a cover of sheet metal or other equivalent material, substantially as described.

2. As an article of manufacture, the combination of a jelly-jar and a cover of sheet metal or other equivalent material.

3. The combination of a jelly-jar and a flanged cover fitting over the mouth of the jar, substantially as described.

136,493.—*Apparatus for Steering Vessels by Steam.*—WILLIAM W. DUNCAN, Baltimore, Md., assignor to MARY D. DUNCAN, same place.

The cylinder reciprocates on a stationary piston, and steam is admitted through a central port in the valve, and the steam is exhausted from the steam-chest through a port therein. The cylinder is connected direct to the tiller of a rudder.

Claim.—The combination of the shaft B, stationary piston C, movable cylinder D with steam-channels *b b*, chest E with inlet *d* and outlet *e*, and the valve G with the port *a*, all constructed and arranged substantially as and for the purposes herein set forth.

136,494.—*Spring Bed-Bottom.*—SAMUEL DUNLAP, Rome, Ga.

India-rubber straps are attached to the head and foot by clasps held by hooks. In the center are notched slats, and upon the inner end of the elastic straps there are clasps that hook over the notches.

Claim.—The combination, with a bedstead, of India rubber straps E, wood slats S, clasps C C', and hooks A, all substantially as specified.

136,495.—*Hemmer for Sewing-Machines.*—HENRY A. ELLIS, Springfield, Mass.

The turner for the edge of the goods has a horizontal tongue that supports the goods directly at the turned edge, and the feeder engages this portion of the hem and moves it to the needle, while the main portion of the hem and fabric is moved by the usual feeding device, and this upper feeder moves the turned edge, often stretched by tearing, &c., and gathers in any fullness. The gage allows hems of different widths to be turned.

Claim.—1. The hem turner, provided with a flat tongue, g^2, extending forward to the needle-hole in the presser, and supporting the turned edge of the material, in combination with the reciprocating upper feeder *g*, which engages and moves only the material lying on the said tongue, as and for the purpose described.

2. The gage A and the stationary tongue g^2, in combination with the feeder *g* and operating-lever *e*, substantially as and for the purpose set forth.

3. The guide B, pivoted to the gage A and provided with means, substantially as described, for holding it in operative position.

4. The combination of the operating-lever *e e f*, set-screw *i*, and the devices *g* g^1 g^2, constructed, arranged, and operating as described.

136,496.—*Ice-Cream Freezer.*—SAMUEL S. FITCH, New York, N. Y.

The cream-holder is arranged within the refrigerating-case between the metallic ice-boxes.

Claim.—The box A, the refrigerating-vessels C C, the auxiliary cover *c*, the cream-holder E, and its agitator F, combined and arranged as set forth.

136,497.—*Steam-Boiler Furnace.*—MICHAEL A. FOSTER, St. Louis, Mo.

A perforated air-supply pipe is placed crosswise in the bridge-wall, and communicates with the front by pipes placed in the side walls, and the air-supply through these to the smoke-pit is regulated by a damper and deflecting-plate. Over the smoke-pit is arranged an elliptical separator, suspended by water-pipes, and by said separator part of the flames pass above and part below to mingle with the air and assist in the combustion.

Claim.—1. The elliptical separating-deflector A, arranged in combination with the smoke-pit B and air-supply pipe C, as and for the purpose set forth.

2. The air-supply pipe C, arranged as described, in combination with the deflecting-plate D, as and for the purpose set forth.

3. The elevated rear bridge-wall F, in combination with the smoke-pit B, elliptical separator A, and air-supply pipe C, as and for the purpose set forth.

4. The combination and arrangement of the separator A, water-pipes *a*, smoke-pit B, bridge-wall B′, air-supply pipe C, damper C′, deflecting-plate D, air-pipe E, and bridge-wall F, as and for the purpose set forth.

136,498.—*Crusher and Press for Culinary Purposes.*—GEORGE B. FOWLER, Brooklyn, assignor of one-half his right to EDWARD S. TORREY and JOSEPH TORREY, New York, N. Y.

The bed and platten are corrugated. A slotted or forked lever engages with a serrated standard, which furnishes an adjustable fulcrum. Between the platen and lever are springs, by which the latter is thrown up when freed from its weight or power.

Claim.—A combined crusher and press, consisting of the bed A and follower B, with their faces diversely corrugated, in combination with the adjusting-standard D and lever C, jointed to the follower, but detached and removable from the fulcrum-standard, and provided with the springs *b b*, with or without the ratchet-holder E, substantially as and for the purposes set forth.

136,499.—*Combined Putty-Knife and Sprig-Box.*—JOHN H. GACHES, Atlanta, Ga.

The handle of the putty-knife is made hollow, and furnished with a screw-cap at the end. This box is to contain sprigs used for retaining the glass in the sash before the putty is applied.

Claim.—A putty-knife, provided with a hollow handle with a suitable cover or lid to form a sprig-box, substantially as herein set forth.

136,500.—*Cultivator.*—LUTHER M. GANONG, Friar's Point, Miss.

An ordinary hand-plow beam, having bolted beneath a lateral frame, in which the standards are slid for lateral adjustment, the latter having slots for the vertical adjustment of the blades, the whole forming a cotton-scraper.

Claim.—The combination of the plate E provided with grooves *e e* and the frames C C provided with beads d^1 d^1, as and for the purpose described.

136,501.—*Loom-Shuttle Motion.*—ANTON GAERTNMANN, New York, N. Y.

Thin transverse guide-plates are attached to and project down from the upper cross-piece of the batten, and are so hollowed out and grooved on the opposite inner faces of the opening as to receive, support, and guide the shuttle, which is provided with shoulders corresponding to the groove in the guide-plates, by which means the shuttle is carried above and does not come in contact with the lower warp-threads of the shed, and is also prevented from flying out of the loom.

Claim.—The transverse guide-plates J, secured to the upper cross piece of the batten, and provided with grooves on their inner edges, corresponding with shoulders or ribs on the sides of the shuttle, to guide and support the shuttle while the same passes through the shed, substantially as described,

136,502.—*Car-Ventilator.*—CHARLES C. GERHARDT, Wyandotte, Kans.

The air-chamber surrounds the hot-air pipe, the air being admitted through openings in either side of the pipe, the openings having guards to conduct the fresh air into the pipe and wire-gauze upon the inside to exclude the dust.

Claim.—The ventilator as herein described, consisting of the combination of the air-receivers D D, the hot-air pipe A, within which is placed the stove-pipe when required, the corrugated or cold-air pipe C, and the air-chamber B, all constructed and arranged to operate substantially as herein set forth.

136,503.—*Machine for Pricking and Nail-Loading Boot and Shoe Heels.*—CHARLES W. GLIDDEN, Lynn, assignor to JAMES W. BROOKS, trustee, Boston, Mass.

The jack with its adjusting mechanism is supported upon arms attached to the frame of the machine, and is capable of vertical adjustment by means of a lever and link, which may be locked in position while rigidly holding the heel-blank; a reciprocating pawl, carrying an inclined pin which engages the teeth upon the outer edge of the nail-plate, feeding it forward as required.

Claim.—1. For feeding the jack, the reciprocating pawl, substantially as shown and described, having a lateral movement and a vertical movement, and carrying an inclined pin, p^3, operated upon by a pin, h^3, to retract the pawl.

2. In a machine for driving or inserting nails, and in combination with mechanism for feeding the jack, the nail-cutting mechanism, substantially as described, for forming the nails to be driven or inserted.

3. A heel-clamping jack having a clamp-plate, p^3, connected to and operated by the lever e^3 and link f^3, the lever and link, when both brought into a vertical position, operating to lock the clamp, substantially as described.

4. In combination with the nail-hole plate and clamp-plate, the arm v^2 for releasing the nails from the nail-hole plate, substantially as described.

136,504.—*Lubricating Spindles.*—JOHN GOULDING, Worcester, Mass.

Claim.—The arrangement, within an oil-chamber or recess surrounding the spindle A, of an absorbent disk or layer, C, which shall not be in contact with the spindle, in combination with a disk or layer, E, which shall slightly touch the spindle, all substantially as and for the purpose set forth.

136,505.—*Machine for Polishing Doors, &c.*—FRANCIS D. GREEN, Williamsport, Pa.

The piece, after having a tenon formed in the ordinary manner, is placed upon a saw-table, where the sides of the tenons are cut. It is then removed to another table, where the shoulders are formed by the action of reciprocating chisels.

Claim.—1. The combination of the adjustable chisel-holder G, with chisel A arranged upon the bridge E, and the movable chisel A′ on the vertical bar H, the latter operated by the foot-lever J, substantially as and for the purposes herein set forth.

2. In combination with the chisels A A′, arranged to operate as described, the table D′, with stops *i′* and adjustable gages *f′*, substantially as and for the purposes herein set forth.

136,506.—*Sewing-Machine Cover.*—CHESTER B. GROVER, Cambridge, Mass.

A sewing-machine cover constructed in two parts and hinged to a stationary back piece, by which each part can be turned to form a table on the side of the machine, and when closed to form a cover for the machine, for its protection when not in use.

Claim.—The improved sewing-machine cover, consisting of the two halves *b c*, hinged to the stationary rear piece *f*, as seen at *g*, so that the halves can be swung to the rear, substantially as shown and described.

136,507.—*Spiral Spring for Furniture.*—HANSON HARD, Akron, Ohio.

The spring is formed with the largest portion conical and the smaller portion cylindrical, with a shoulder-coil between them and a bent end, so that the cylindrical end can be forced into the hole in the base or slat.

Claim.—In combination with coiled springs made partially conical and partially cylindrical, and with a shoulder-coil between them, and with a base or body having round mortises or seats therein, the bent ends C of said springs, for the purpose of easily introducing the dowel or tenon portions of such springs into their seats, as described and represented.

136,508.—*Flour-Bolt.*—CHARLES A. HARPER, Burlington, N. J.

Used in connection with a grinding-mill intended for family use, for separating the flour, bran, and middlings.

Claim.—1. The combination, with the drawer or receptable F and bolting-reel E overhanging its rear end, of the sieve H and drawer I, substantially as and for the purpose specified.

2. The elements enumerated in the preceding claim, in combination with the guard G, substantially as and for the purpose specified.

136,509.—*Furnace and Furnace-Door.*—BENJAMIN R. HAWLEY, Normal, Ill.

A large annular smoke-chamber connects with the fire-chamber by elongated openings, through which the heavy gases pass. An auxiliary grate, instead of the dead-plate, is employed with the main grate, to obviate necessity of extinguishing fire. Cones with partitions are inserted into the door instead of the perforated plates.

Claim.—1. The furnace herein described, with one large annular smoke-chamber, B, surrounding the whole fire-box, substantially as shown, and for the purpose set forth.

2. The arrangement of the main grate E and auxiliary grate F, as and for the purpose herein described.

3. The cone L, placed either vertical or horizontal, when arranged substantially as shown and specified.

4. The double air-chamber around the fire-chamber D and smoke-chamber B, when arranged substantially as and for the purpose described.

5. The furnace D, provided with annular vertical cones K, substantially as and for the purpose described.

6. The combination of the frame and plate with a furnace-door provided with dovetailed grooves *i* and cones L, arranged substantially as and for the purpose described.

7. The combination and arrangement of the shell A, annular smoke-chamber B, flues I, fire-chamber D, grates E F, and feed-passage, all arranged substantially as and for the purpose specified.

136,510.—*Furnace and Steam-Generator for Heating, &c.*—BENJAMIN R. HAWLEY, Normal, Ill.

The furnace projects into and is arranged in an interior cylinder surrounded by a water-space on its sides, bottom, and top, connected by a series of annular arranged tubes, tapered toward the bottom. The heat and products of combustion ascend toward the arched top, and then descend in a stratum toward the bottom, from where the smoke, &c., escapes.

Claim.—1. A boiler or heater in which a fire-box is so arranged that the products of combustion are discharged into the entire chamber, rising to the crown-sheet and spreading out to the walls, and descending in a stratum over the whole chamber to the bottom and escaping thereat, substantially in the manner herein described.

2. The arrangement of the shell B, furnace E, tubes D, and crown-sheet G, water space C, and escape-passage F T V, substantially as respresented in Sheet 1 of the drawing.

136,511.—*Ozone-Generator.*—ROBERT HENRAGE, Buffalo, N. Y.

Claim.—1. The method, herein described, of conducting air and water into the generating-chamber A by means of the series of upright tubes *a a*, whereby the necessary amount of air is simultaneously produced for generating and the water for separating, as herein before specified.

2. In the separating-chamber E, the division-plates *d f*, whereby the compartments *e* F G are formed, for the purposes hereinbefore fully set forth.

3. The use of sponge or its equivalent, placed in the compartments *e* F J or their equivalents, for the purpose hereinbefore fully explained.

4. The general construction of the ozone generator and seperator, consisting of the series of upright air and water tubes *a a*, the generating-chamber A, the separating-chamber E, with the division-plates *d f* forming the compartments *e* F G, with the water-eduction pipe *i* and ozone-eduction pipe *h*, all arranged and operating in the manner and for the purpose specified.

5. The auxiliary separating-chamber H, with the compartments J formed by the division-plates *k*, with the sponge packing *n*, and with the induction-pipe *s* and eduction-pipe *t*, all arranged in the manner and for the purpose substantially as specified.

6. Introducing water into the top of the auxiliary chamber H by means of the pipe *s* or its equivalent, whereby the ozone that is generated in the chamber A beneath is separated in its passage up and through the compartments J and sponge packing *n*, as hereinbefore fully set forth.

136,512.—*Ozone-Generator.*—ROBERT HENRAGE, Buffalo, N. Y.

Claim.—1. In ozone-generating machines, utilizing the water used for washing and purifying, to operate the pump or pumps, and thereby produce the air necessary to generate ozone in the retort, as herein before fully explained.

2. The generating vessel or retort constructed with two walls—the outer, K, of metal and the inner, *r*, of glass—the space *s* between backed or "luted" with plaster of Paris or its equivalent, as and for the purpose herein before specified.

3. The construction of the purifying-vessels, consisting of the lower metallic chamber *w* having the perforated plate R and the upper glass chamber P, separated by the division-plate J with the connecting opening *v*, all arranged and operating in the manner and for the purpose herein before specified.

4. In the purifying-chambers, the plate R for breaking the globules, and having the perforations for the escape of the gas, constructed as and for the purpose specified.

5. In the discharge-chamber S, the gas-discharge pipe *x*, constructed with the flaring mouth and perforated sides, and arranged over the pipe S, in the manner and for the purpose specified.

6. The method of supplying water to the tank by means of the self-acting double-barreled pump C C′, the rods connected and working over a pulley, *d*, the automatic vibrating feed-pipe *f*, and supply-pipe F, operated by the forked bar *g* and lugs A A′, all arranged and operating as herein before specified.

7. The method of supplying air to the tank by means of the pumps C C′, the air-valve pipe H, the water-packed plungers *a a* and pipes D E, all arranged and operating in the manner and for the purpose specified.

136,513.—*Fruit-Jar.*—HENRY HERING, Philadelphia, Pa.

A wire ring is affixed to an ordinary jar, and has projections arranged thereon to engage in the slots constructed in the lugs that are attached to the cover.

Claim.—The combination of the jar A, ring B and cap C, the said ring B being formed of wire with bent loops *b*, and the cap C having ears *c* with beveled recesses *c′*, substantially as and for the purpose specified.

136,514.—*Cigar-Tip.*—WILLIAM M. HERRON, Allegheny, Pa., assignor to himself and JOHN J. MCDERMOTT, same place.

At the tip two cuts are made at right angles with each other, forming V-shaped valves, which open at each draft and close at each puff or discharge of the smoke, and prevent saliva entering the end of the cigar.

Claim.—A new article of manufacture—the elastic tip provided with the V-shaped valves *c*, *d*, *e*, and *f*, as herein described, and for the purpose set forth.

136,515.—*Fire-Proof Building.*—ANDREAS K. HOLTE, Chicago, Ill.

Claim.—A building constructed with an arched roof of brick, and having the exterior of its brick or stone walls and such roof covered with a layer of clay, which is, in turn, coated with hydraulic cement or its equivalent, substantially as and for the purpose specified.

136,516.—*Roofing.*—JOHN H. HOOD, Dansville, N. Y.

The roof-covering is built up of layers of felt overlapping and breaking joints, with layers of cement interposed. The joints are battened with wooden strips.

Claim.—The combination of a roofing made up of two or more coverings of felt embedded in cement, as described, and a series of wooden or equivalent strips, *c*, covering the joints of the felt, as and for the purpose specified.

136,517.—*Machine for Dressing Millstones.*—FRANCIS A. HOYT, La Crosse, Wis., assignor of two-thirds of his right to GEORGE A. LITTLE and DEAN, SMITH & Co., same place.

The tubular post braces the shaft locked to the mill-spindle and turning the pinion when the lower stone is to be dressed, and when the upper stone is to be operated upon receives a shaft carrying a pulley, while the shaft remaining attached to the mill-spindle is also provided with a pulley, and operates the mechanism by belting.

Claim.—1. The herein-described method of dressing and furrowing millstones—that is to say, by means of a rapidly-revolving wheel of emery.

2. The central tubular post provided with the pinion S, in combination with the frame of the machine pivoted thereon, and provided with the pinion U and screw R or its equivalent, as shown and described, whereby the machine may be driven by the mill-spindle.

3. The adjustable shoe K′ or its equivalent, arranged to support the outer end of way C, whereby the way may be inclined and the cutter caused to rise as it approaches the edge of the stone, as and for the purpose set forth.

4. The support K″ or its equivalent, provided with a shaft arranged to be connected to the mill-spindle, whereby the machine, when placed on the upper stone, may be operated directly from the mill-spindle, as set forth.

136,518.—*Electro-Magnetic Annunciator.*—WILLIAM HUMANS, Cambridge, Mass.

By means of two alternating reversing electric switches, operated at two adjacent rooms or signal-stations, an oscillating magnetic armature of a single electro-magnet is made to act upon either of two adjacent numbers or indicators, as desired, according to the direction of the current, whereby one main circuit and one magnet are enabled to perform double duty.

Claim.—1. An electric annunciator in which, with a single armature and a single straight coil or spool, drops for two adjacent rooms of the building are operated, thus making for any number of rooms but half the number of straight coils and armatures, substantially as shown and described.

2. The combination of each swinging armature with two drops by means of the pair of catches, either of which is operated to release a drop by the swinging of the armature against the arm *e* of the catch.

3. In an electric annunciator for hotels and other buildings, the combination of two switches, *s t*, with the single spool and armature mechanism, substantially as shown, and for the purpose described.

4. In an electric annunciator for hotels and other buildings, the combination of the switches for two rooms with a single armature and the same main circuit, the switch for each room acting to send a current in a direction opposite that sent by the other, substantially as shown and described.

136,519.—*Vault-Cover.*—THADDEUS HYATT, New York, N. Y.

The object of the porous coating is to absorb the moisture which condenses upon the under side of a metallic vault-cover, and thus prevent the unpleasant drip.

Claim.—In a vault-cover, floor-light, &c., composed wholly or in part of metal, a coating of felt or other fibrous or porous material, secured to or upon the lower side of the metal, substantially as and for the purpose specified.

136,520.—*Brick-Machine.*—DONALD J. IRWIN, Noble, Ill.

The clay is cut in the mud-mill between alternate revolving and stationary plates, from whence it passes into the feeder, through it out into the molds, which are intermittingly fed forward by the loading mechanism onto the revolving mold-bearer, which carries them round to the feeder and between guides, and under the revolving cutter and planer, then onward, and flirts them off onto the revolving table, from whence they are removed by hand.

Claim.—1. The revolving mold-bearer G, provided with a series of arms, H, pivoted at regular intervals to its outer edge, and each arm having a carrier, I, pivoted to its outer end, substantially as and for the purposes herein set forth.

2. The carrier I, pivoted to the outer end of the pivoted arm H and provided with the flange *i* and the stop *k*, substantially as and for the purposes herein set forth.

3. The combination of the crank *m* on the pivot of the arm H and the rollers *n* and *n′*, for the purposes herein set forth.

4. The combination of the flange *i* on the carrier I and the rollers *p* and *p′*, for the purposes herein set forth.

5. The combination of the arm H with crank *m* on its pivot, the carrier I with flange *i*, and the rollers *n n′* and *p p′*, all substantially as and for the purposes herein set forth.

6. The loading mechanism, consisting of the stationary frame L with stop-bars *t t* and springs *v v*, the movable plate M, and the movable frame N with stop-bars *t′ t′*, substantially as and for the purposes herein set forth,

7. The combination, with the loader, of the lever O, links *w w′*, rods *x x′*, levers P P′, and pin or projection *y* on the mold-carrier G, substantially as and for the purposes herein set forth.

136,521.—*Portable Stove.*—GEORGE B. ISHAM, Burlington, Vt.

Improvement on his patent of January 19, 1869. The removable fire-pot is serrated at its upper edge. The draft may be upward through the apertures thus made, or it may be downward through the grate and the dampered openings at the lower edge of the pot.

Claim.—The fire-pot D, open at its bottom, and provided near its top with slots or openings *a a*, when disconnected from and used in combination with a suitable stove-body and a removable cap, G, constructed in the manner and for the purpose set forth.

136,522.—*Furniture-Caster.*—JOB JOHNSON, Brooklyn, N. Y.—Case A.

A locking-cap for the ordinary furniture-caster is provided with a lug or pin upon the inside of the cap, which engages with an inclined locking-groove formed on the opposite side, and a screw or pin is inserted from the outside through both portions of the

cap to prevent the cap from turning or being accidentally disconnected.

Claim.—The cap *l*, secured to the socket containing the caster-ball by a pin entering the groove 3, and a screw or pin, 4, to prevent the cap turning, as set forth.

136,518.—*Car-Coupling.*—JOHN W. JONES, (of P. De Catesby,) Towerstown, Md.

The link entering drives the lower ends of the pins until its shouldered head has passed beyond them, when they are returned to their vertical position by a spring. Uncoupling is effected by means of a chain attached to the lower end of a crank-arm on the axle-bar of the pins or by a series of rods extending throughout the length of the train.

Claim.—1. In combination with the draw-heads A A, having the axle-shafts B, pins *b*, spiral springs *c*, and lever C, the anchor-bar E, gum block G, and coupling-pin F, substantially as herein set forth.

2. The combination of the pin *f* of the lever C, sliding bar I, slides I', and spiral spring *g*, with the sliding horizontal bar H, lever G', and circular guiding-stand K, substantially as herein described, for the purposes set forth.

136,524.—*Oil-Burning Steam-Generator.*—OLIVER W. KETCHUM, Toronto, Canada.

The air forced into a tank containing oil, &c., drives the hydrocarbon through a pipe in jets into the combustion-chamber, where it meets a supply of air forced in through another pipe. The hydrocarbon burns as fast as supplied, and the heat and other products of combustion are carried through a curved pipe extending into the steam space, and discharged through perforations in the pipe into the water of the boiler.

Claim.—The air-tight hydrocarbon-chamber C, connected with air-pump by a pipe, C^1, and with the air-tight flame-chamber C^2 by a pipe, D, having jet-pipes F F^1 F^2, as and for the purpose described.

136,525.—*Tray for Sewing-Machines.*—GUSTAVUS A. KIRCHNER, Philadelphia, Pa.

A series of trays are jointed to each other on one corner and adapted to slide in and out of the case. The case is provided with a door hinged at the bottom. To the inside upper end of the door a spring is attached, the other end of the spring being attached to the lower tray, so that when the door is fully opened the spring draws the trays out. Cords and pulleys are arranged under the trays to aid in the returning of the trays to the case.

Claim.—1. The series of jointed trays B, adapted to slide as one in and out of the casing A, in combination with mechanism for imparting the sliding movements to said series of trays, substantially as and for the purpose set forth.

2. The combination, with the casing A and sliding trays B, of the door B', arranged on the side of the casing, whereby the trays are permitted to slide on the door, and be supported thereon when withdrawn from the casing, as set forth.

3. The combination, with the casing A, door B', and sliding trays B, of the spring F, operating to withdraw the trays and close the door, in the manner set forth.

4. The combination, with the casing A and sliding trays B, of the cords E E', applied and operating as set forth.

136,526.—*End-Iron.*—GEORGE W. C. LOVELL, Clarksville, Tenn.

Holding-lugs on the handle-plate and base, respectively. Said plate and base are secured together by a locking device consisting of a cam-lever and a suitable catch.

Claim.—A end-iron constructed substantially as described, with holding-lugs *a* and *b* on the handle plate and base, respectively, and the locking device, consisting of a cam-lever, C, held by a suitable catch to prevent their accidental separation.

136,527.—*Mill for Grinding Barley.*—JOHN MACKAY, Dundas, Canada.

The barley is fed automatically through two hoppers to the grinding apparatus by two valves having passages for the grain to pass through, and so arranged upon a rotating shaft that the passages are opened and closed alternately; also, valves arranged on outside of casing for discharging the ground material.

Claim.—1. In a barley-mill, an automatic feeding-valve, *b*, having a passage, *b'*, arranged upon a rotating shaft, C, operating in connection with a hopper, B, having a passage, B', for the purpose described.

2. The discharging-valve *a*, constructed and arranged on the casing *a*, and operating substantially as described.

3. The combination of the discharging-valve *a*, shoe W, crank-pin V, lever W^2, cam-plate U, bevel-pinion U^2, and bevel-wheel T on the upright shaft C, substantially as and for the purposes described and set forth.

4. In a barley-mill, the combination of the pinion O, large spur-wheel M, pinion L, and spur-ring N, arranged for the purpose of driving the casing *a*, substantially as shown and described.

5. In a barley-mill, the combination of the valves *a* and *b* having passages *a' b'*, and arranged on and rotating with the shaft C, in combination with hoppers A and B having passages A' and B', substantially as and for the purposes described and set forth.

136,528.—*Apparatus for Stretching Wire Fences.*—JOSIAH T. MANGHAM, Gatesville, Tex.

A lever provided with a windlass at one end for winding up the wire to a bearing, after which the lever is carried around the post, thus bringing the wire to the required tension.

Claim.—1. An improved implement for stretching wire in the construction of fences, consisting of a lever provided with a windlass at one of its ends, when these parts are combined to operate substantially as described.

2. The combination of the frame, the arbor, and the open bearings that hold the arbor in position when operated as a windlass, but permit it to be removed from the frame for wrapping and securing the end of the wire after it has been stretched, substantially as described.

136,529.—*Excelsior-Machine.*—WILLIAM H. MATO, Orono, Me.

The cutting-knives are fixed in a rotary frame; the stock is fixed in stationary standards and fed down automatically, while the frame carries the cutters under the stock. A trough in the frame receives the excelsior and a sweep removes it to one discharging place. A brush clears the knives.

Claim.—1. The trough or box *i*, for the reception of the excelsior, or a portion of it, in combination with a removing device attached to the wheel *a*, substantially as described.

2. A revolving brush, as described, operated by a friction wheel, *l*, bearing against the rim of the driving-wheel *c*, for clearing the knives or cutters.

136,530.—*Railroad-Rail Joint.*—MALCOLM F. MCINTYRE, Girard, Pa.

Claim.—1. The bolt A, formed with the ratchet-teeth a^1 and depression a^2, substantially as shown and described.

2. The combination of the bolts A A, rail B, and fish-plates C C, substantially as shown and described.

136,531.—*Head-Rest.*—OTIS M. MITCHELL, Marathon, assignor to ABRAHAM NELLIS, Fort Plain, N. Y.

To a shank placed in the back of a chair is attached a ratchet bar, which slides up and down within it. A spring-pawl holds the bar in different positions. A cross-head is located at the top of the ratchet-bar, and has sockets at its ends, to which is attached a strap for the head to rest in.

Claim.—A portable head-rest for car seats, chairs, &c., consisting of the base A, ratchet-bar B, cross-head C, loops D, strap E, and hooks or clamps G, when arranged, combined, and operating as herein described.

136,532.—*Treating Tinners' Clippings.*—FREDERICK G. MORTON, Bermondsey, Great Britain.

Tinners' clippings are immersed in hydrochloric acid, full strength, and the tin being removed the iron plates are washed, dried in lime, and heated to 700° Fahrenheit in a reverberatory furnace to remove the lead and other impurities. The acid solution is saturated by the addition of grain-tin. The solution is then diluted with water and plates of zinc immersed to precipitate the tin, which is used in making paper-foil.

Claim.—1. The process of treating tin-plate waste scraps or clippings by the employment, as herein explained, of muriatic or hydrochloric acid of the strength specified, for the separation of the tin from the iron and the utilization of the tin product, substantially as described.

2. The process of treating tin-plate waste scraps or clippings containing lead or other impurities by dissolving the tin in muriatic or hydrochloric acid and subsequently heating the plates in a suitable furnace so as to effectually remove the lead or other impurities from the iron, substantially as described.

136,533.—*Lifting-Jack.*—THOMAS W. H. MOSELEY, Hyde Park, Mass.

Lifting jack with extensible standard to form the prop, and a pair of opposing toggles, through which to apply power to the movable section; the near toggle operated by pressure on a foot-rest, and the further toggle moved by a handle, notched to engage with pins on the near toggle, so as to serve as a lock to support the standard at any height.

Claim.—1. The combination, in a lifting-jack, of the extensible standard composed of base A, head B, guide-rod *z*, and hollow stem *y*, and the opposing toggles C D, substantially as herein shown and described, for the purpose specified.

2. The combination of the extensible standard A B, toggles C D, foot-rest E, handle F, and locking-pins G with or without the extension-block H, substantially as and for the purpose herein set forth.

136,534.—*Bottle and Bottle-Stopper.*—HENRY NAYLOR, Oil City, Pa.

The stopper is made with a central duct and lateral opening, and the bottle with a concavity. A suitable fastening secures the stopper to the bottle, yet permits the rotation of the former to open or close it. In the above construction the stopper need not be removed for filling the bottle or pouring therefrom, and when closed it will retain liquors or gases under pressure.

Claim.—The concavity *c*, central duct *d*, and lateral opening *e*, constructed and arranged as herein shown and described, in combination with suitable fastenings for retaining and permitting the rotation of the stopper, substantially as set forth.

136,535.—*Billiard-Cue.*—LEOPOLD NEMZ, New York, N. Y.

The cue-tip is fastened to a wooden slider working with slight play against a rubber cushion within the ferrule. A slot in the slider holds it in place upon a rivet passing through the ferrule.

Claim.—The sliding slotted block B, in combination with a ferrule, E, India-rubber or elastic pad D, and billiard-cue A, arranged substantially as and for the purpose hereinbefore set forth.

136,536.—*Potato-Digger.*—HENRY B. NORTON, Rochester, N. Y.

An endless belt receives the potatoes from the digging-share and separates them from the soil. The digging-share is held in place by tension-rods between the jaws, and circular cutters divide the vines.

Claim.—1. The endless belt J, constructed to swing up at the rear end, as shown, and supported by rods *j j* to seat-rest I.

2. The sliding bearings *i i i i*, in combination with frame H H, operating as shown in Figs. 1 and 2.

3. The special construction of sliding bearings *i i*, as shown in Figs. 15 and 16.

4. The combination of vine-cutters F F, brace-rods *m m*, and points *n n* of standards E E, as shown, for the purpose set forth.

5. The arrangement of rocking levers *o o*, as shown, to strike alternately, as shown and described.

6. The shaft I, supporting the pulleys *q q*, constructed with an offset, direct or gradual, in combination with the endless belt J, as shown and described, for the purpose set forth.

7. The pulleys *q q*, constructed as shown in Figs. 11 and 12, for the purpose set forth.

8. The scoop K, attached to standards E E by means of jaws and rod, as shown in Fig. 13.

9. The arrangement of oiling-wheels *t t*, for the purpose of oiling the joints of the endless belt J, as shown and described, for the purpose set forth.

136,537.—*Stationary Fire-Pipe for Buildings.*—HENRY PALMIERI, Philadelphia, Pa.

The vertical stationary pipe has inclined offsets at each story, closed by a screw-cap, and above each juncture is placed a self-closing "Ludlow" valve, ordinarily held open by a chain, but closing immediately on release, thus allowing the whole stream to be sent at once to the required point.

Claim.—The combination, with a vertical conducting water-pipe, of the series of connections or branches and screw-caps at different altitudes and the automatically-operating shut-off valves, arranged immediately above each branch, the whole constructed in all its details substantially as and for the purposes set forth.

136,538.—*Neck-Tie Supporter.*—EMIL PELTZ, New York, N. Y.

Claim.—The wire frame A, provided with loops *a a*, and with a hook or other retaining device, *b*, in combination with a neck-tie shield, B, the wings of which are secured in the loops of the frame A, substantially in the manner herein shown and described.

136,539.—*Combined Rake and Tedder.*—STUART PERRY, Newport, N. Y.

The tedding-reel is mounted in rear of a through-axle, in a T-shaped frame, and between the supporting-wheels. The tedder-shafts have cranks rigidly attached to one end, and on the cranks are friction-rollers which work in cam-ways to control the motion of the tedding-forks. The machine is converted into a rake by detaching the tedder-shafts and replacing them in a reversed position, the cranks fitting in notches in a circular plate or hood.

Claim.—1. The combination of the supporting and driving wheels, turning independently of each other on a continuous axle-tree, the T-shaped main frame D D'', the rotating reel hung upon the said main frame in rear of the axle-tree and within the wheels, and carrying tine-bearing shafts having rigid arms, which connect them with a cam-way, and the cam-way fastened upon the said main frame, all constructed and arranged substantially in the manner and for the purpose described.

2. In a rotary tedder, the combination of a reel having rocking tine-shafts, each connected by its single rigid arm and friction-roll or slide to a cam-way, *g*, which controls its rocking movement, and the cam-way *g* having that part of its track which controls the tines, while acting on the grass in the form of a true circle, concentric with the axis of the reel, for preventing either acceleration or retardation of the tines while acting on the grass, and the other part formed so as to cause the tines to dip backward after lifting and be restored again before entering the grass, substantially as and for the purpose described.

3. The wrought-iron tubular tine-shafts F, in combination with a series of grass-spreading tines coiled around each of said tubular shafts, and fastened thereto by bolts which pass directly through them, substantially as described.

4. In combination with the main frame, hinged to the axle-tree, the branched lever which spans or straddles the axle-tree, and serves as brace and lever, substantially as described.

5. In combination with a reel for tedding hay, the reversible tine-bearing shafts or bar for converting the machine from a tedder to a rake, and devices *n p*, serving as a stop to prevent said shafts or bars from turning in their bearings when in the rake form, substantially as described.

6. In combination with a reel that is convertible to a rake, the rake-lever M and its appliances for controlling the reel when working as a rake, substantially as described.

136,540.—*Car-Coupling.*—CHARLES PORTER, Nunda, N. Y.

Claim.—The latch D with hook *f* upon the inside, and provided with slot *e* and notch *i*, in combination with the pins *d* and B, link C, and draw-head A, all constructed and arranged for operation so that when the cars are coupled the latch will fall below the link, as and for the purpose specified.

136,541.—*Saw-Mill.*—D. CLINT. PRESCOTT, Marinette, Wis.

The arrangement of the gearing which connects the crank-shaft with the feed-rolls enables the feed to be changed as desired, through the medium of a pair of brush-wheels, one of which is longitudinally adjustable upon its shaft.

Claim.—The bevel-gears C and E, upright shaft D, friction-plate I, friction-wheel J provided with groove *k*, keyed shaft L, bevel-gears M and N, shaft P, bevel-gears Q and R, and shaft S, all combined and operating together as and for the purposes described.

136,542.—*Apparatus for Cooling Milk and Cream.*—JOHN PRINCE and NORRIS D. MARTIN, North Craftsbury, Vt.

The cream-chamber is constructed within a water-tight vessel, having suitable induction and eduction pipes so arranged as to keep up a current of water around the cream-chamber when in use.

Claim.—The apparatus as described, consisting of the vessel A, the tight water-space *d*, (encompassing and extending underneath such,) the chambered covers B B', the tunnel D, the discharge-pipe E, and the educt F, and faucet G, arranged and combined in manner and to operate as and for the purposes as specified.

136,543.—*Sewing-Machine Table.*—SAMUEL J. PURDY, Philadelphia, Pa., assignor to WILLIAM HENRY GROVE, same place.

A case of drawers pivoted at one end in an upright case, with an opening or space between the back and the drawers into which the extension slide is passed when not in use. The cap or cover is hinged near its center, and the front part of it furnishes a support, when turned down, for the extension top of the table. Over the drawers is an opening covered by a circular hinged cover, which can be opened and used as a receptacle for work, &c.

Claim.—1. The combination, substantially as described, of a set of drawers or other receptacles, D, and a sliding extension leaf, F, with a case, A, adapted for attachment to the end of a sewing-machine table.

2. The sliding extension leaf F, adapted to the space within the case A, at the rear of the drawers, and to the top of the said case and end of the sewing-machine table, substantially as specified.

3. The combination, with the said sliding extension leaf and case, of a hinged flap, H, for the purpose specified.

4. The case A, constructed substantially as described, and having a receptacle, J, and lid *a*, as set forth.

136,544.—*Oil-Can.*—AARON P. QUINBY, Newark, N. J., assignor of one-half his right to WILLIAM A. FREEMAN, same place.

Claim.—The combination, with the elastic bottom and nozzle of the can, of the tubular stud *d* and tubular sleeve *b*, arranged and operating substantially as and for the purpose herein described.

136,545.—*Hydrant.*—THOMAS RAGAN, Philadelphia, Pa.

The water is admitted to the hydrant by a ball-valve. The ball rests in a seat, where it is held down by a piston provided with cars moving in guides in the valve-box, said cars being notched so as to communicate with a waste-port in the side of the pipe, to permit the escape of water from the hydrant after the valve is closed.

Claim.—The combination of the pipe C, valve-box D, valve *d*, heads G and H, and nut h' *l'*, constructed and arranged substantially as shown, with the screw-rod F and piston F', the said piston having cars or flanges, which move in guides in the valve-box D, said flanges being notched to communicate with the waste-port *e*, as set forth.

136,546.—*Baker's Oven.*—JOHN RAYNEY, Brooklyn, N. Y., and WILLIAM CAIRNS, Jersey City, N. J., assignors to JOHN RAYNEY, Brooklyn, N. Y.

The arms carrying the journaled baking-shelves are fixed upon the shaft which gives motion to the apparatus. This shaft passes through a fixed bevel-wheel whose pinions mesh into those of the inside wheels on the arms. The outer bar wheels mesh into the wheels on the ends of the arms. Thus the shelves will not be tilted out of horizontal position when the oven is in operation.

Claim.—The combination of the shaft H, fixed wheel K, pinions *e* and *f*, shafts L, wheels M, and shelves J, substantially as hereinbefore set forth.

136,547.—*Car-Coupling.*—SAMUEL B. REPLOGLE, Roaring Springs, Pa.

After the hook has been thrown slightly forward by the draw-head being forced under the platform, its toe is caught by the spring, and its fall is accelerated until it passes over the catch on the approaching draw-head.

Claim.—The coupling-hook C having the projecting arm *e* and toe *l*, in combination with the hook D, constructed and operating substantially as described.

136,548.—*School Furniture.*—JOHN L. EITER, Brownsville, Ind.

The standards and seat-arms have T-shaped flanges that fit in T-shaped grooves in the lid and seat. The back has a detachable rib secured to it formed in the same way. The seat-arm is hinged by a bolt, with flanges and cushion to prevent noise.

Claim.—1. The removable ribs *c*, with the side flanges *a*, in combination with the grooves *d* in the slats of the back C, substantially as shown and described.

2. The combination, with the ears A, of the hinge-arm E having the projections *v* on each side of the bolt-hole, and the bolt-head *k* having parallel sides, substantially as specified.

3. In a hinge-arm, the combination of the cushion *z*, the stop *i*, cast in front of the cushion-seat, and the ears A A, substantially as shown and described.

4. The combination, with the slotted boards of the desk, seat, and back, of the standards having the flanged desk-ribs, the removable back-ribs, and the hinged seat-arms having flanged ribs, all arranged substantially as specified.

5. The combination, with the ear of the hinge-arm having the projections on each side of the bolt hole of the bolt-head having parallel sides, substantially as specified.

136,549.—*Clasp for Leather Belts.*—LOUIS SANDERS, Brooklyn, E. D., N. Y.

Claim.—The ornamental clasp for uniting the contiguous ends of pieces of belt-leather, made with the teeth 2 at the edges of the central portion 1 to pass through the leather and be clinched, and the shields 3 to cover such clinched teeth at the back, as set forth.

136,550.—*Link.*—ROBERT C. SCHENCK, Jr., Dayton, Ohio.

A link made of a twisted bar of metal.

Claim.—1. A link, the metal of whose sides is twisted, irrespective of the shape of the link or the configuration of its surface.

2. A link having its surface fluted for the purpose of giving greater elasticity to the link when twisted, substantially as described.

136,551.—*Peg-Float.*—PHILIP A. ECHOELLHOEN, Buffalo, N. Y.

The pivoted float may be adjusted at any angle required, and held in position by means of a spring-buckle.

Claim.—The combination of the float E, adjustable standard B, and a pivoted fastening device, C, actuated by a spring, and having a pin which enters holes in the adjustable standard, for the purpose and substantially as described.

136,552.—*Folding Knife and Fork.*—HENRY SCHUMACHER, Philadelphia, Pa.

The knife-blade shuts into and is entirely concealed in the fork-handle, and the fork-tines are in like manner concealed in the knife-handle, the whole presenting when closed only a continuous double handle.

Claim.—The knife A and fork B, each provided with a hollow handle, the handles being closed at their outer ends and open at their inner ends, whereby, when the knife and fork are folded, the blade is in the handle of the fork and the prongs are in the handle of the knife, with the open ends in contact, and the two handles form a single closed casing, the parts being arranged and operating substantially as described.

136,553.—*Lamp.*—GEORGE H. SIMMONS, Bennington, Vt.

The feed-tube has at its lower extremity springs which catch into recesses in the funnel-tube, and at its middle ports for the flow of oil in filling. When the burner is in place for using, an expansion on the feed-tube rests upon a seat in the funnel. In the upper end of the feed-tube are openings through which the overplus oil may drop to the catch-funnel, and from thence into the fount.

Claim.—1. The sliding feed-tube G, having the expansion R, in combination with the funnel-tube, having a suitable seat, S, for said expansion, substantially as specified.

2. The vertically-sliding feed-tube G, having at its upper end and middle the apertures J and K, and its lower end slitted to form expanding springs N and bead M, substantially as shown, and for the purposes set forth.

3. The catch-funnel tube T, constructed as described, and shown in Fig. 4, consisting of the collar O, tube U, and screw-threaded collar H, with openings.

4. The combination of the sliding feed-tube G, provided with the apertures J and K and expanding springs N, and catch-funnel tube T, provided near its lower end with the annular groove L, substantially as specified.

5. The funnel-tube U, having an annular groove, L, substantially as specified, and for the purpose described.

136,554.—*Medical Compound for Skin Diseases.*—AARON B. SIMPSON, Camden, Ohio.

Poke root, one and one-half ounce; May apple root, one and one-half ounce; stillingia root, one and one-half ounce; blue-flag root, one and one-half ounce; burdock root, one and one-half ounce; dandelion root, one and one-half ounce; sarsaparilla root, one and one-half ounce; iodide of potassa, one and one-half ounce; alcohol, one pint; sugar, one pound.

Claim.—The combination of the ingredients herein specified, in the proportions named, substantially as and for the purpose described.

136,555.—*Earth-Auger.*—BARBARA SMITH, Memphis, Tenn., administratrix of JOHN SMITH, deceased, assignor to HANDLE & HEATH, same place.

An earth-auger of the "basket" class, arranged to include the pebbles and ordinary impediments within itself, so that they can be lifted out by the instrument.

Claim.—1. A tapering spiral coil forming a basket, terminating at its upper end in a stem for attachment to a boring-shaft, and at its lower end in a central penetrating-point, substantially as and for the purpose described.

2. The arrangement of the spiral coil in such manner that its spiral intervices increase in width as they proceed from the lower toward the upper portion of the basket, substantially as described, for the purpose specified.

136,556.—*Button-Fastening.*—NELSON B. SMITH, New York, N. Y., assignor to himself and EDWARD SMITH, New London, Conn.

A metallic disk has an attached hook which is stamped facially out of it. The button is attached at one end of the hook, which is cut open for that purpose.

Claim.—The metal disk or plate A, having an attached hook, B, cut, punched, or stamped facially out of it, for reception of the eye or shank of the button over the open end *b* of the hook, substantially as shown and described.

136,557.—*Oil-Still.*—JOHN L. STEWART and JOHN B. DUBLER, Philadelphia, Pa.

A series of carriers and radial trusses are arranged to support the still, and counteract the buckling of the bottom and thrusting out of the side walls due to expansion.

Claim.—1. The still-carriers C, so arranged as to support the still by its exterior circumference, as and for the purpose herein described.

2. The radial trusses *g'*, arranged within and upon the bottom of the still, as herein described.

3. The combination of the still-carriers C, the radial trusses *g'*, and the central stationary support A, operating in conjunction to support the still, substantially as herein described.

4. The annular grate H, arranged as herein shown beneath the bottom of the still G, in combination with suitable firing-doors E, arranged at intervals around it.

5. The shelf *e*, arranged in combination with the outside shell of the still, for collecting and conducting off the condensed vapor as herein shown and described.

6. The expansion joint formed by the flange T, the lower edge of which dips into a circular groove, *t'*, as herein shown and described.

7. The trussed columns W, connecting the top and bottom of the still, arranged vertically over the circular wall of the central pier, as and for the purpose herein described.

136,558.—*Shears for Counters.*—NELSON STOW, Binghamton, N. Y.

A knife-blade pivoted in the counter cuts against a stationary blade. Two levers are placed within a recess in the counter for operating the knife-blade, one of which, for closing, is placed upon the same rock-shaft with the knife-blade, and the other, for opening the blade, works with its short arm against the first-mentioned lever and raises it.

Claim.—The combination, with pivoted blade and stationary bar C, of the pivoted thumb-piece D and lever E, constructed and arranged in connection with plate, substantially as and for the purpose described.

136,559.—*Machine for Sawing Staves.*—NICHOLAS J. TEMPLETON, Cincinnati, Ohio, assignor to himself and HENRY C. EZEKIEL.

Provided with reversible and adjustable boxes, for varying the radius of the arc in which the staves are cut.

Claim.—In a stave-sawing machine, the combination of the swinging work-table and frame F F', sliding blocks G, and reversible sliding blocks M, to which the table is hung eccentrically at *f*, substantially as and for the purposes specified.

136,560.—*Building-Dock.*—AMBROSE W. THOMPSON and JUAN PATTISON, New York, N. Y.; said PATTISON assignor to said THOMPSON.

Piles, grillage, masonry, and rubble combined, covered with concrete to support transverse iron floor and side beams covered with planking.

Claim.—The building-dock herein described, constructed with the courses of rubble-stones or dry masonry immediately on the ground, the surface of concrete on the rubble-stones, the iron floor and side beams above the concrete to sustain the planking, and the wooden planking thereon, suitable spaces being left between the planking and the concrete for the water to drain off into the wells R R, substantially as and for the purposes herein set forth.

136,561.—*Mode of Cutting Out Uppers for Shoes.*—EDWARD H. THURSTON, Montreal, Canada, assignor to himself and ROGER BOYD, Marlborough, Mass.

By piercing the quarter the uppers may be cut from a skin without waste.

Claim.—The within-described method of cutting and making quarters for boots and shoes, in which a part of the counter or heel portion of the quarter is omitted, and the piece required to complete the quarter afterward secured thereto, substantially as and for the purpose set forth.

136,562.—*Invalid-Bed Bottom.*—CHARLES A. TOWSLEY, Battle Creek, Mich.

A plate is fastened to the side rail, having a curved toothed rack. A pinion, while attached to each end of the shaft, works in the rack, and on one side there is a lever and pawl.

Claim.—The hinged bed-bottom having the plate C provided with the curved toothed rack D, and shaft E having at one end the pinion E' and lever G, substantially as specified.

136,563.—*Ventilating Under-Ground and Subsurface Railways.*—OLGEN VANDENBURGH, New York, N. Y.

The railway is constructed with a double track and with a separate and distinct tunnel for each track, each tunnel being no larger in its transverse sectional area than is necessary for the free movement of the train, by the transit of which the air is expelled before it from the tunnel, through suitably-located lateral passages, while fresh air is caused to enter behind it by reason of the vacuum produced by such transit. The locomotive or any one of the cars is provided with a surrounding and projecting disk, the edges of which conform to the transverse sectional area of the tunnel. Lateral or connecting openings furnished with registers are made to allow a portion of the air expelled from or entering either subway to pass into the adjacent subway. A removable curtain is arranged between the station and each lateral escape-passage to avoid the draft through the station and to exclude dust and gases therefrom.

Claim.—1. The combination, with the lateral ventilating ducts or passages G and stations in a double-track under-ground railway, having a separate subway for each track, of curtains H, arranged in relation with the ducts and stations, substantially as herein described, for the purpose set forth.

2. The openings I between the subways, provided with shutters or registers J, essentially as and for the purpose herein described.

3. In combination with the subway of a locomotive line or lines of railway, the disk L, surrounding the locomotive, tender, or car, substantially as and for the purpose herein specified.

136,564.—*Sulky-Harrow.*—GEORGE W. VAN GORDER, Warren, Ohio.

The harrow is composed of a double V-shaped frame, provided with teeth and land-markers. The harrow is swung below the axle-tree of bearing-wheels. The axle-tree has an offset at each wheel, forming what is termed a crank axle tree, by which the harrow is raised and lowered by a lever and keeper.

Claim.—The frame B and wheels A, axial offset D, and lever F, as constructed and arranged in combination with the harrow E having markers H I, in the manner as and for the purpose set forth.

136,565.—*Gas-Illuminator.*—JOHN B. VAN PATTEN, Newark, N. J.

Claim.—The combined shield and liquid-cup B C, formed in one piece, with an intermediate and horizontal shoulder for bearing on a horizontal bracket or frame, A, and an opening, *a*, for the passage of a horizontal burner, D, so as to project the flame over the liquid in the cup C, substantially as and for the purpose specified.

136,566.—*Picture-Nail.*—GUSTAV VINTSCHGER, New York, N. Y.

The upper end of the shank is screw-threaded, and is thereby attached to a slotted plate which bears upon the inner side of the metallic cap that contains the porcelain head.

Claim.—The retaining-disk *b*, provided with a series of radial slots, *d*, in combination with the supporting-plate *a*, head A, and screw-headed nail B, all the parts being constructed substantially in the manner herein shown and described.

136,567.—*Wheel for Vehicles.*—SIMON VREELAND, of Pot'stown, Pa., assignor to METALLIC SUSPENSION-WHEEL COMPANY, same place.

Claim.—1. The combination of the inner ends of the spokes with the hollow cylinder C, which is rigidly connected to the spokes by and between permanent collars and nuts on the spokes, as set forth.

2. The combination of the washers G G', box B and nut H.

3. The combination of the severed ring A adapted to the axle, the box B, and screw-ring *m*.

136,568.—*Brick-Kiln.*—PATRICK J. WALSH and WILLIAM J. TAYLOR, Oil City, Pa.

As the bricks contract when the kiln is burning the plating sinks bodily with them without cracking. The chimneys are placed at an angle with the sides so as to be easily operated without exposure to the sulphur, &c., from the coal.

Claim.—1. The plating A, consisting of a layer of brick daubed down tightly with a layer of clay or mud, so that it will maintain its form intact, sinking bodily inside of the outer wall as the mass of bricks contracts from the effect of heat, substantially as set forth.

2. The chimneys *c*, provided with valves and valve-rests, placed in an angular position, so as to enable them to be operated from the side, and the smoke and fumes of sulphur avoided, substantially as set forth and shown.

136,569.—*Car-Roof.*—JOHN C. WANDS, Nashville, Tenn.

Sheets of zinc are fastened to the top of the car-frame, and roof-boards are then laid over the zinc and secured in position by longitudinal bands.

Claim.—The car-roof herein described, having the wooden frame consisting of the parts A B C W, the bands E and K, the zinc sheets D, and grooved roof-boards G, the several parts being constructed and arranged substantially as and for the purpose specified.

136,570.—*Carriage Running-Gear.*—JOSEPH L. WARE, Mantorville, Minn., assignor to SILAS E. WARE, Waupun, Wis.

Claim.—A coupling for carriages, consisting of the ring D, provided at opposite ends with the bolts *a b*, and having the axle passing through and pivoted in said ring, the whole being constructed and arranged to operate substantially as described.

136,571.—*Mortar-Mixer.*—CHARLES W. WASSON, Friendship, N. Y.

Mixes and grinds mortar by passing it between rollers revolving at unequal speeds, one being adapted to yield for passage of non-pulverable substances, such yielding bringing a pan automatically under the rollers, catching and retaining the non-pulverable substance.

Claim.—1. A machine for grinding and mixing mortar, cement, &c., composed of two rollers revolving at unequal velocities, one of which is made adjustable, and adapted to yield for the passage of non-pulverable substances, substantially as described, for the purpose specified.

2. A machine for grinding and mixing mortar, cement, &c., adapted to automatically separate non-pulverable substances from the compound, by means substantially as described.

3. In a machine for grinding and mixing mortar, cement, &c., a separating-pan, operated automatically by the adjustable yielding pressure-roller, substantially as described, for the purpose specified.

4. The combination of the roller B, yielding adjustable roller C, and the separating-pan V, substantially as described, for the purpose specified.

5. The combination of the adjustable arms Q, connecting-rods S, yielding roller C, and spring rock-shaft M with the separating-pan V, substantially as described, for the purpose specified.

6. In combination with the sliding separating-pan V and rock-shaft M, the stop W, spring X, and latch Y, substantially as described, for the purpose specified.

7. In combination with the rods, shaft M and its attachments, the springs U, substantially as described, for the purpose specified.

8. The combination of the roller B, yielding pressure-roller C, adjustable arms Q, connecting-rods S, spring rock shaft M, latch Y, and spring separating-pan V, substantially as described, for the purposes specified.

136,572.—*Wood Pavement.*—CYRENUS WHEELER, Jr., Auburn, N. Y.

The upper flange of the iron wedge forms a wearing-surface, and the lips at the sides serve to lock the blocks together.

Claim.—1. In combination with a wooden pavement, an iron wedge provided upon the upper side or end with a lip or flange resting upon the blocks, said lip or flange forming a wearing-surface, as described.

2. In combination with a wooden pavement, an iron wedge, made in form substantially as described, for locking the blocks crosswise and wedging them lengthwise, as set forth.

136,573.—*Lamp.*—THOMAS H. WHITE and EDGAR KNIGHT, Cleveland, Ohio.

A tube rising from the bottom of the air-chamber has at its upper end a hollow screw adapted to receive the burner-screw. Depending from the burner is a larger tube. When the parts are in place the air passes from the bottom of the chamber out between the tubes.

Claim.—The skirt G, made of one entire piece of imperforated metal, chamber B, oil-tube C, provided with a screw-thread to support and hold the burner and skirt in place, in combination with the wick-tube D and fount A, constructed and arranged substantially as and for the purpose set forth.

136,574.—*Cultivator.*—EDWARD WIARD, Louisville, Ky., assignor to BENJAMIN F. AVERY, same place.

A cultivator with means of adjustment to carry one, two, or three shovels, and to change their relative positions upon the beam, and their distance therefrom by means of posts of different lengths, through which pass screw-bolts, as shown.

Claim.—The cultivator, with the described means for adjustment to carry one two, or three shovels, and to change the same to different positions, as shown in the drawing.

136,575.—*Can for Oil and Paint.*—JOB T. WILLIAMS, Philadelphia, Pa.

Claim.—A solid seamless breast for cans, constructed and applied as shown, and made either with or without an annular groove, as described.

136,576.—*Tea-Kettle.*—CHAUNCEY D. WOODRUFF, Toledo, Ohio.

Claim.—1. In a tea-kettle, an inclosing-strip of non-corrosive metal applied to and embracing the edge of the cover-opening or of the cover, substantially as and for the purpose specified.

2. In a tea-kettle, a cover having its rim constructed of or from non-corrosive metal, substantially as and for the purpose shown.

3. The ears E, constructed as shown, and capable of being combined with a kettle, substantially as and for the purpose set forth.

136,577.—*Swing-Joint for Pipes.*—JAMES R. WORSWICK and EDWARD LEWIS, Cleveland, Ohio.

Upon one side of each section of the joint the wall is depressed so as to form a right-angled recess, and up n the faces of the recesses are formed circular bearings. An opening is provided in and through the wall of each section, and within the line of the bearings. The sections are united by means of a bolt. The object of this construction is to produce a swing-joint that, while flexible in one direction, shall not render necessary a change of the lines of the pipes at their points of attachment.

Claim.—1. The sections A and A, constructed as shown, and connected together so that when placed in a line with each other their open ends *a'* shall have a common center, substantially as and for the purpose specified.

2. The swing or expansion joint shown, consisting of the sections A and A, provided each with a recessed side, B, a bearing, *b*, and an opening, C, and combined by means of the bolt D, substantially as and for the purpose set forth.

REISSUE PATENTS.

5,302.—*Rod and Fluting Iron.*—JOHN HEWITT, Pittsburg, Pa.—Patent No. 135,116, dated January 21, 1873.

The body of the iron is reversible, being pivoted to the handle, and held by a forked lever and a spring. A fluting-plate is attached to one face of the iron by a lug and thumb-screw.

Claim.—The reversible iron A, having holes *a' a'* arranged as shown, handle B, corrugated plate F, and spring thumb-latch D having forked arms *d d* provided with bearing-pins *d' d'*, when the whole is so combined and arranged as to operate substantially as described.

5,303.—*Circular-Saw Mill.*—LEWIS C. PATTEE, Lebanon, N. H.—Patent No. 121,466, dated December 5, 1871.

An adjustable gage-roll is placed outside of the saw, against which the lumber rests during the operating of sawing, thus securing accuracy in its thickness. The setting-blocks are operated, through a system of gearing, by the contact of a friction pulley with an incline plane.

Claim.—1. The friction driving-roller G, movable rail F, actuated by treadle N through lever *n*, and arm *f*, in combination with the carriage C, set-blocks E, and intermediate means for setting the log to the saw, substantially as described.

2. The combination of the device above claimed with the adjustable gage-roller M, to determine the thickness of the stuff to be sawed, substantially in the manner shown and described.

3. The combination, in a circular-saw mill, of the friction-d

mechanism to set the log to the saw, the adjustable gage-roller to determine the thickness of the lumber to be sawed, with the circular saw, substantially in the manner described and shown.

5,304.—*Method of Operating Windlasses.*—PETER PHILIP, Ghent, N. Y.—Patent No. 24,755, dated July 12, 1859.

The sweep, arranged loosely upon the shaft, and serving, when necessary, as a friction-lever against the circle C, is thrown in and out of gear by moving a rod to engage with or clear the arm.

Claim.—1. The sweep or horse lever B, when loosely attached in its bearing to the shaft or drum, for the purpose set forth

2. The loose sweep B as combined horse and friction-lever.

3. The combination of the loose sweep B, shaft A, cram A', arm *a*, and lever D, or equivalent adjusting attachments, substantially for the purpose set forth.

5,305.—*Sewing-Machine.*—WILLIAM CLEVELAND HICKS, Summit, N. J.—Patent No. 23,357, dated April 12, 1859.

The table may be lengthened out to any required distance, and the needle, feed apparatus, and shuttle be moved accordingly to the distant end of said table, while the driving-shaft remains at the opposite end, without requiring any new adjustment other than lengthening of the bracket-arm and links.

Claim.—1. The combination, substantially as herein set forth, of a flat-shuttle sewing-machine table, provided with a shuttle-driver or race-way running substantially parallel with its upper surface; a bracket-arm, attached by its foot to one end of said table, and extending substantially parallel with said shuttle-race to support the needle-stock and mechanism, substantially as set forth, for giving said needle-stock a vertical reciprocating motion by means of a cam or crank on the driving-shaft; a shaft arranged at right angles to said shuttle-race, in a bearing or bearings attached to the platform of the table, provided with a cam or crank which operates the feed, and with a crank which reciprocates the shuttle once forward and back at each revolution, by a continuous and positive crank motion, both located under the table and under the foot of the bracket-arm; a wheel feed or other feeding mechanism under the table; and a shuttle-driver, all arranged in such manner that the direction in which the materials to be sewed shall be fed and sewed shall be in a line parallel with said bracket-arm, and toward and into the bight formed by the said arm and the table.

2. The arrangement, substantially as herein set forth, of a partially revolving thread-controlling crank or lever, on a stud set at right angles to the bracket-arm, above and parallel with the table, and connected, substantially as described, with a cam or crank on the main shaft under the table, in such manner that the needle-thread is entirely controlled and drawn up between the tension apparatus and the needle by said lever, actuated by the movements of said cam or crank without the intervention of the needle-stock.

3. The combination, substantially as herein set forth, of the needle-stock, bracket-arm, pinion, connecting rod and lever, with the driving-shaft, in such manner that the motions of the cam or crank on said shaft may be transmitted to the pinion and needle-stock, substantially as herein set forth.

4. The combination, substantially as set forth, in a shuttle sewing-machine, of a table provided with a shuttle race or way running parallel to its upper surface, and with a bracket-arm, fastened by its foot at one end of said table, lying substantially parallel with said shuttle race or way, to support a vertically-reciprocating needle-stock; and a shaft located (in a bearing or bearings attached to the platform of a table) at right angles to the shuttle race or way, and bracket-arm provided with cams or cranks under the table, and under the foot of the bracket-arm, for actuating the shuttle and feed, by means of connecting-rods, reciprocating in the direction of their length, substantially as set forth; and connected, through the foot of the bracket-arm, to a rod or bar running longitudinally through the bracket-arm, to actuate the mechanism which reciprocates the needle-stock, substantially as set forth, so that the table, the bracket-arm, and the connecting rods or bars, may be lengthened in the same direction, without changing the cams or cranks which actuate the needle-stock and shuttle, or their combined motions in reference to each other, substantially as set forth.

5,306.—*Sewing-Machine for Working Button-Holes.*—EDMUND HOWARD, Flushing, and WILLIAM H. JACKSON, Brooklyn, N. Y., assignors, by mesne assignments, to BENET E. TOWNSEND, CHARLES P. BRIGHAM, and GEORGE W. SIMMONS, Boston, Mass. Patent No. 69,671, dated October 8, 1867.

The hooked arm rests immediately under the throat-plate when the needle descends, and when the needle rises its loop having been caught by the under thread, the arm is drawn from the throat, the lower thread is drawn to the slit needle, and the latter then is moved forward and up through the button-hole slit, and a loop of under thread is laid over the edge and in the path of the upper needle.

Claim.—1. The arrangement of the device for catching the under thread in a button-hole sewing-machine, substantially as above described, so that it will form a portion of the throat of the machine, as and for the purpose specified.

2. The combination of the hooked arm E and slit needle K, or their respective equivalents, when arranged to operate together and with reference to the ordinary sewing mechanism, substantially as described, and for the purpose specified.

3. The combination of the hooked arm, slit needle, under thread-carrier, and connect'ng mechanism, substantially as described.

5,307.—*Railroad Rail.*—ALMERON MCKENNEY, Maumee City, Ohio.—Patent No. 116,975, dated July 11, 1871.—Division A.

Claim.—A compound rail for railroads, consisting of the hollow arched base-rail B, provided with an outward flange on each side, grooved the entire length of each flange at the lower sides of the arch-walls *f f*, in combination with the exterior cap-rail A, overlapping the top and the entire sides of the base-rail, with its extremities fitting into the grooves in the same and secured by lateral bolts, all substantially as and for the purpose set forth.

5,308.—*Nut-Locking Device for Railroad-Rail Joints.*—ALMERON MCKENNEY, Maumee City, Ohio.—Patent No. 116,975, dated July 11, 1871.—Division B.

Claim.—The within-described locking-plate, consisting of the flat-bar A, provided with one or more recesses, *a*, cut into its upper edge, as shown, the bar being placed on its edge on the flange of a railroad rail and held contiguous to the rail by a spike, D, driven from the outside, all as and for the purposes set forth.

5,309.—*Slide-Valve.*—JOHN NESBITT, East Boston, Mass., assignor to WILLIAM G. ULERY.—Patent No. 110,490, dated December 27, 1870.—Division A.

Air is admitted through exhaust-port into valve-chest, and thence into cylinder, to prevent vacuum being formed when steam is shut off and engine continues in motion.

Claim.—The combination of the slide-valve and its inclosing-case with one or more puppet-valves, arranged to have constant communication with the exhaust-cavity of the valve, substantially as described, and operating automatically to admit air therefrom into the steam-chest at the time and in the manner set forth.

5,310.—*Slide-Valve for Steam-Engine.*—JOHN NESBITT, East Boston, Mass., assignor to WILLIAM G. ULERY.—Patent No. 110,490, dated December 27, 1870.—Division B.

To prevent a vacuum being formed in the cylinder and valve-chest by the continuing motion of the piston after the steam is shut off, as when a locomotive is running down a grade, air is admitted into the valve-chest at a point outside of the exhaust-port and valve.

Claim.—In combination with the valve-chest, the air-admission valve, operating automatically at the time and in the manner set forth, to admit air into said chest through a passage or opening leading from the exterior atmosphere, and entering the valve-chest at a point outside of the steam-valve and the exhaust, substantially as described.

5,311.—*Bracelet.*—FRANCIS M. SWEET, Newark, N. J., assignor to DAVID D. CODDING, ARTHUR E. CODDING, and THERON I. SMITH.—Patent No. 21,381, dated August 31, 1858; extended seven years.

The elastic connection or metallic spring admits of the enlargement of the bracelet to pass over the hand, and close the same thereafter.

Claim.—A bracelet composed of two parts, F and G, made hollow and shaped to the contour of the wrist, and held together by an elastic rubber or spring connection, as described, the whole article being substantially as described.

5,312.—*Bed-Bottom.*—ANDREW TURNBULL and RODOLPHUS L. WEBB, New Britain, Conn., assignors, by mesne assignments, to the NATIONAL WIRE-MATTRESS COMPANY, same place.—Patent No. 125 421, dated April 9, 1872; reissue No. 5,185, dated December 10, 1872.

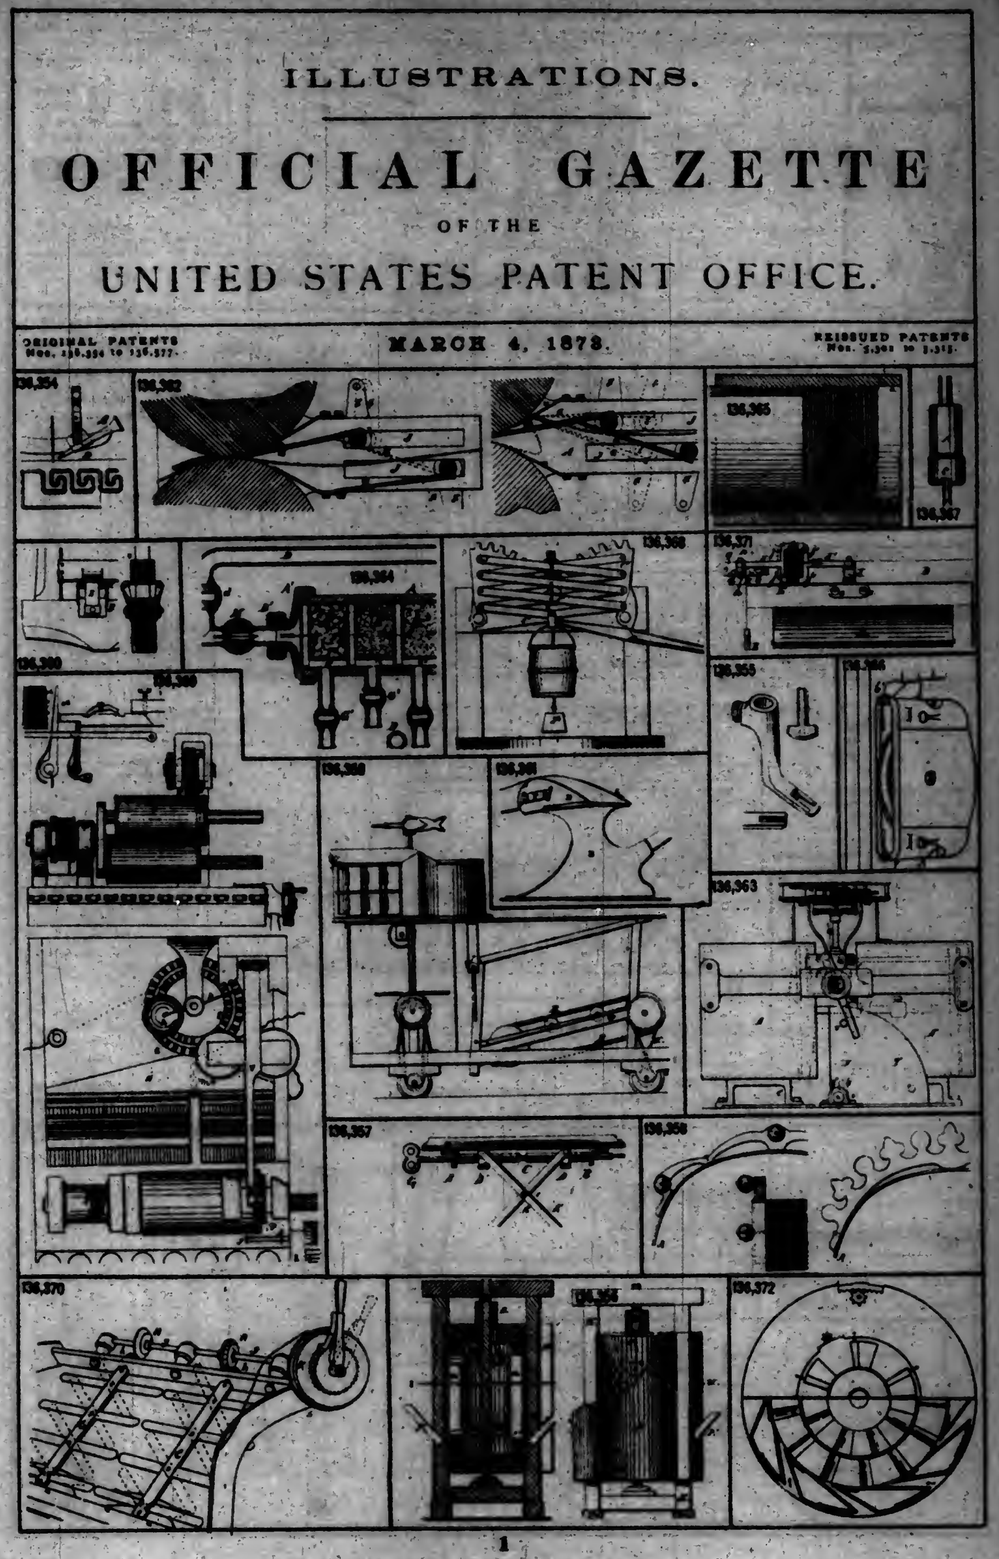
The side rails are attached to transverse bars, one at each end, which are held in place by sockets. To these end bars are attached a series of spiral springs, to the springs rings, and between the rings are longitudinal and transverse links, also triangular links and auxiliary springs.

Claim.—1. A bed-bottom composed of jointed links D D F F disconnected from the side rails of the frame, but made elastic longitudinally by springs C C, substantially as described, for the purpose specified.

2. In combination with the subject-matter of the first clause of claim, the auxiliary springs S and their triangular draw-bars T T, substantially as specified.

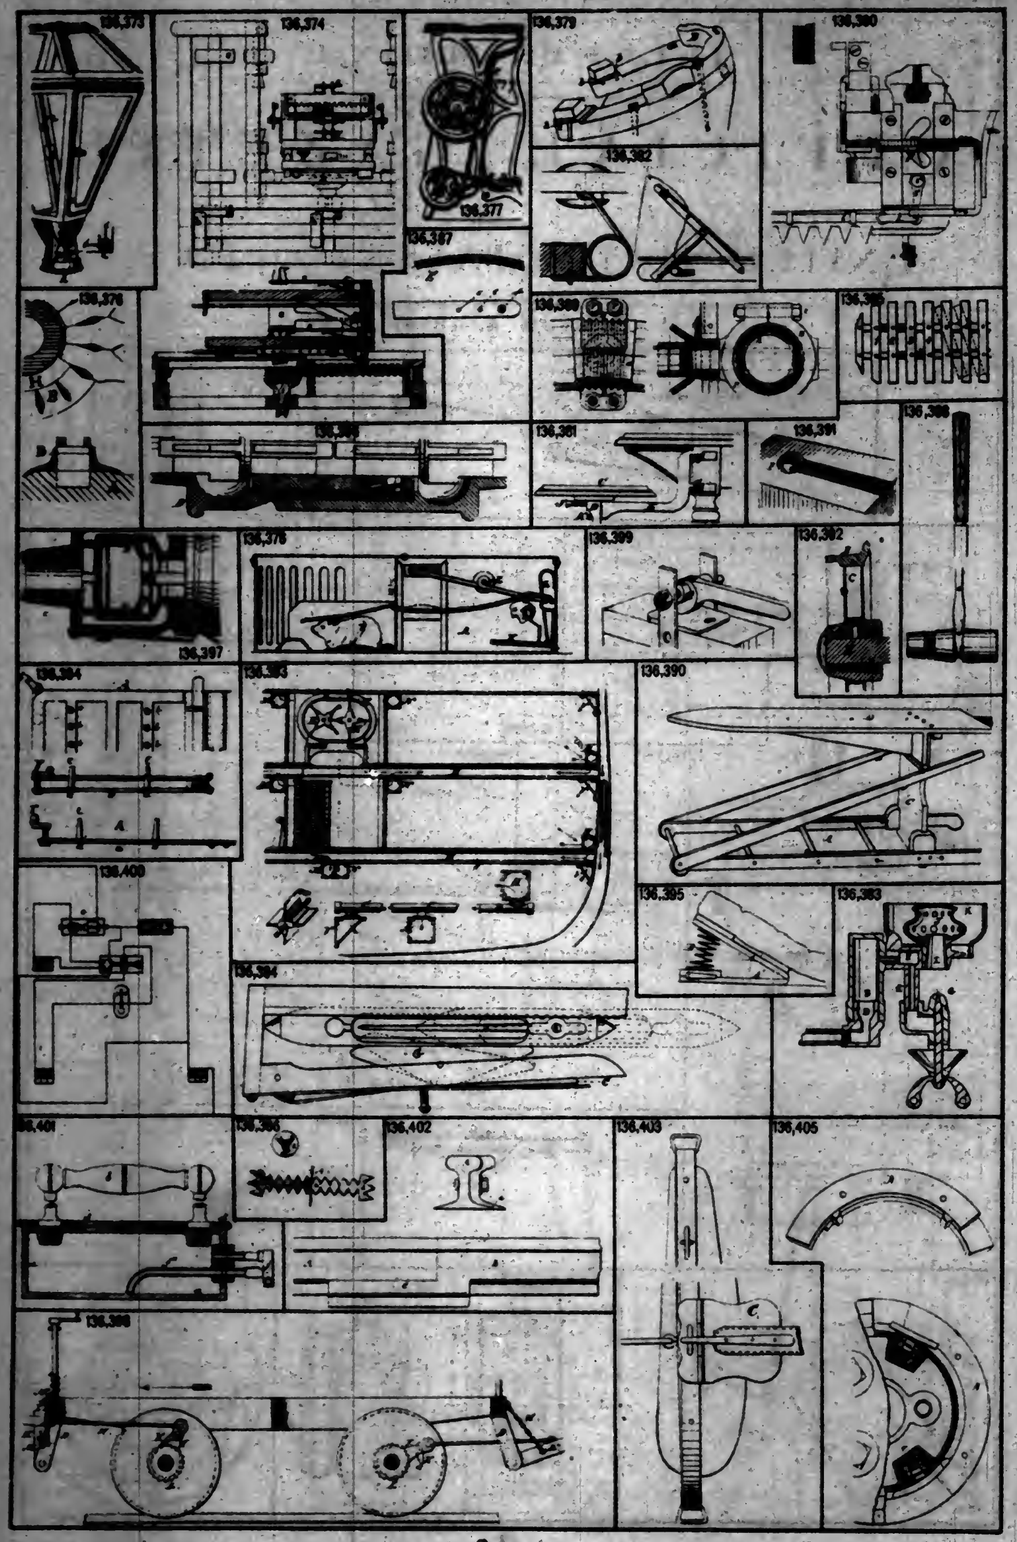
3. In a frame for bed-bottom, consisting of the transverse bars A B and longitudinal bars L L, the seat or socket *a d*, by which the said transverse bars are attached to the longitudinal bars, substantially as described.

5,313.—*Machine for Arranging Nails.*—ALBION KNOWLTON, Boston, Mass., assignor to JOHN HILL, trustee of the MCKAY HEELING-MACHINE ASSOCIATION.—Patent No. 118,250, dated August 22, 1871.



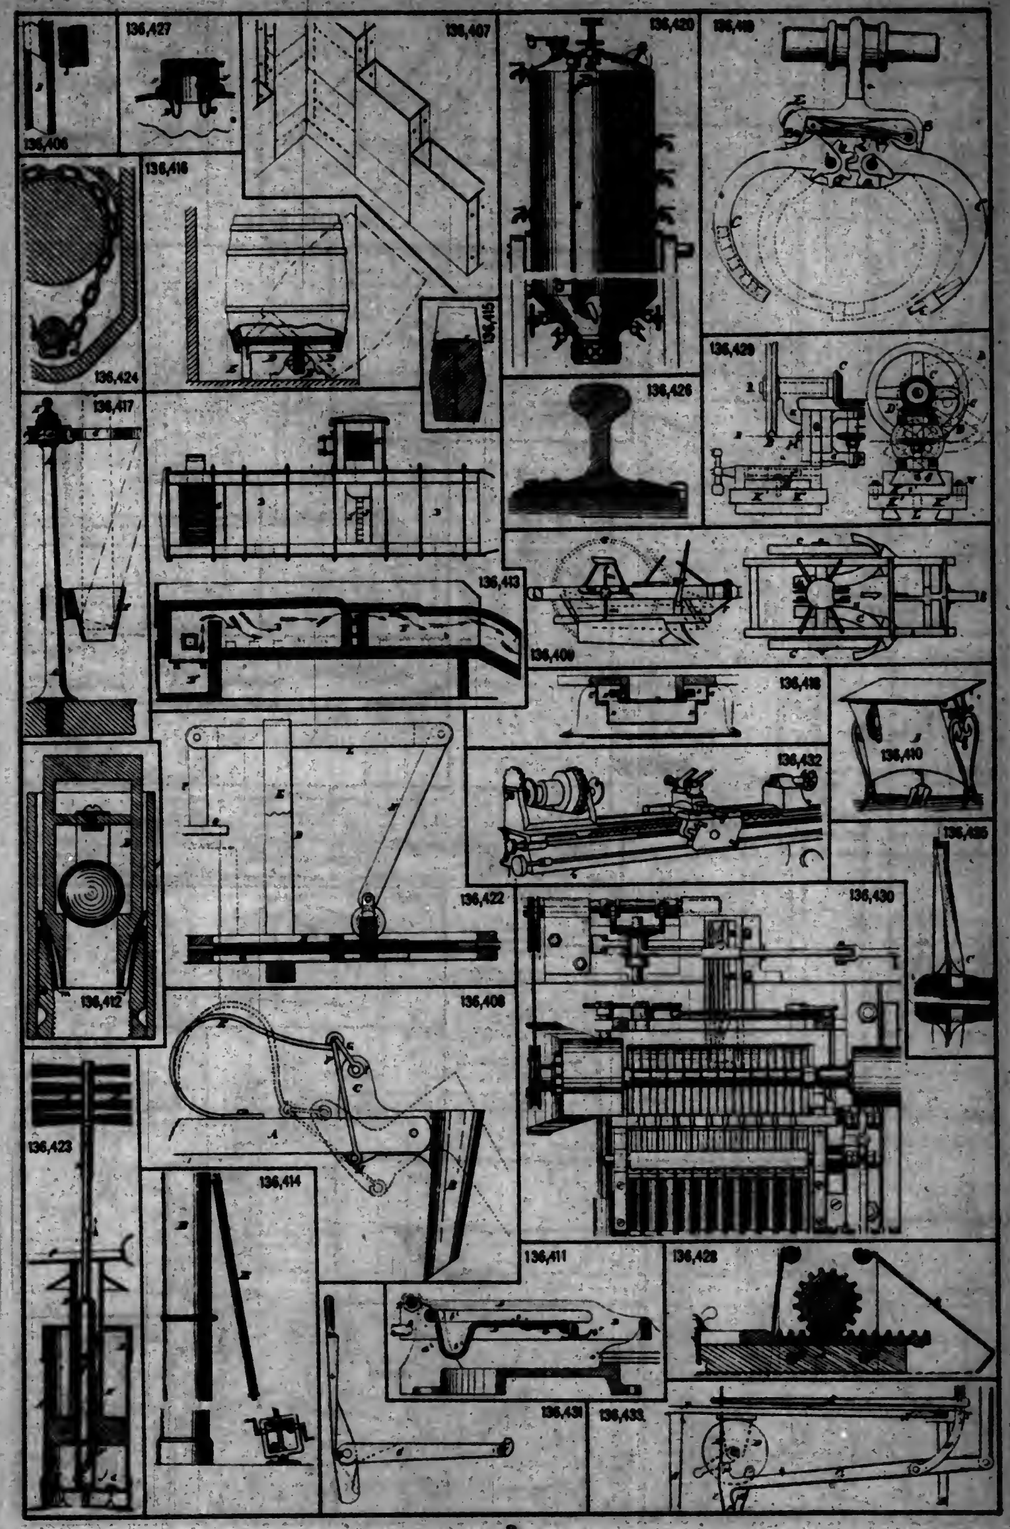
A reciprocating hopper deposits the nails in the chamber, whence they descend into the pocket of a reciprocating frame. A pocket full of nails moves over a stationary pocket, in doing which a plunger separates from the superposed pile the lowermost nail, which falls through the stationary pocket onto a knife-edged bar that extends across a conductor, where it is partially arrested, and caused to turn head downward.

Claim.—1. In combination with the vertical nail-chamber B, the sliding nail pocket or passage *d*, plunger J, and the nail-conducting chute *z*, so arranged that by relative sliding movement the nails pass singly from the chamber to the pocket, and from the pocket to the conductor, substantially as described.



2. The combination of the vertical nail-chamber B, nail-pocket *d*, plunger J, nail-pocket *z*, plate E, and chute or conductor H, the chamber B, pocket *z*, and chute H being stationary, and the pocket *d* and plate E movable, the whole operating to select and deliver one by one the nails, substantially as described.

3. The combination, with the pin *i*, of the stationary plate F and its pocket *z*, and the movable plate E and pocket *d*, substantially as shown and described.



4. The combination of the nail-chamber, the reciprocating frame D having the pocket *d*, and the reciprocating chamber-

charging hopper C, operating to keep the chamber supplied with nails, substantially as described.

5,314.—*Heating-Stove.*—James Spear, Philadelphia, Pa.—Patent No. 102,328, dated April 26, 1870.

A grated fire-pot, having an opening in front, and a hearth-plate in front of such opening and on a level with the grate proper, is suspended within the conical base of a stove. Opposite the opening in the grated fire-pot are doors, which are provided with mica windows.

Claim.—1. The grate G, with opening K′ and hearth-plate M arranged within the base A, substantially as herein described.

2. The arrangement of the grate and lower part of the grated fire-pot within and in combination with the cone-shaped base A, as described.

3. The arrangement of the grate and lower part of the fire-pot within and in combination with the conical base A, when such base is provided with doors or windows *e*′, for the purpose herein described.

5,315.—*Wooden Shank for Boots and Shoes.*—Jeremiah M. Watson, Sharon, Mass., assignor to himself and Horace A. Lothrop.—Patent No. 112,754, dated March 14, 1871.

The stiffener is made of separate layers of wood secured together at their rear end, and left free to slide upon each other at their toe end.

Claim.—1. A wooden shank-stiffener formed of separate strips or layers of wood, substantially as herein described.

2. A wooden shank-stiffener formed of separate strips or layers united at one end, substantially as herein described.

3. A wooden shank-stiffener having its toe end consisting of several strips or leaves, arranged as herein described, for the purpose of allowing them to move freely upon one another, as set forth.

INDEX OF INVENTIONS PATENTED MARCH 4, 1873.

[The numbers in parentheses denote the classification of patents.]

Alcoholic liquids with ozone for producing vinegar, (19,) R. D. Turner 136,470
Annunciator, electro-magnetic, (50,) W. Humaus 136,518
Annunciator, electro-magnetic, (50,) Shawk and Storer 136,465
Auger, earth, (51,) J. B. Smith 136,535
Augers, die for manufacturing, (29,) S. A. Smith 136,391
Banjo, (102,) H. C. Dobson 136,491
Barrel support, (1,) F. W. Claussen 136,416
Bed bottom, (62,) Ogborn and Kendrick 136,382
Bed bottom, (62,) Turnbull and Webb, (reissue) 5,312
Bed bottom, invalid, (62,) C. A. Towsley 136,502
Bed bottom, spring, (62,) S. Dunlap 136,494
Beds, head rest for, (62,) B. F. Walton 136,395
Bedstead, bureau, or wardrobe, (62,) C. May 136,443
Billiard cue, (143,) L. Nemets 136,535
Boiler, sectional steam, (148,) Pancoast and Maule 136,453
Boiler attachment, wash, (135,) C. D. Belnking 136,385
Bolt, flour, (57,) C. A. Harper 136,506
Boot and shoe, lasting, (16,) J. C. Wightman 136,476
Boot and shoe heels, machine for pricking and nail loading, (16,) C. W. Glidden 136,503
Boots and shoes, wooden shank for, (16,) J. M. Watson, (reissue) 5,315
Bottle washer, (1,) W. Dick 136,423
Bottle and bottle stopper, (1,) H. Naylor 136,534
Bottles, frame for making straw envelopes for, (1,) W. F. Tillinghast 136,394
Bracelet, (86,) F. M. Sweet, (reissue) 5,311
Brick machine, (20,) D. J. Irwin 136,520
Brick and tile machine, (20,) G. Baldwin 136,481
Bridge, iron, (21,) W. Sellers 136,389
Buildings, construction of, (4,) W. Boschke 136,407
Bung, (40,) W. F. Class 136,415
Burial caskets, composition for, (39,) A. N. Atwood 136,404
Button fastening, (23,) N. B. Smith 136,556
Can, oil, (87,) A. P. Quinby 136,544
Can for oil and paint, (107,) J. T. Williams 136,575

Car coupling, (122,) C. Porter 136,540
Car coupling, (122,) S. B. Replogle 136,547
Car, railway, (121,) H. Buck 136,259
Car roof, (121,) J. C. Wanda 136,569
Car starter, (122,) N. J. Wilkinson 136,396
Car ventilator, (121,) C. C. Gerhardt 136,502
Car wheel, (122,) G. W. and L. W. Snyder 136,392
Car axle box, (122,) J. M. Dodge 136,424
Car axle box, (122,) S. Ustick 136,472
Carriage running gear, (31,) J. L. Ware 136,570
Carriage axles, manufacture of, (31,) Schirck and Smith 136,460
Cartridge of fusible metals, &c., (32,) W. H. Tooth 136,468
Caster, furniture, (94,) J. Johnson 136,522
Centrifugal machine, (155,) C. T. Burchardt 136,485
Cigar tip, (160,) W. M. Herron 136,514
Cigar bunching machine, (160,) H. B. Bunster 136,411
Cigar molds, clamp for, (160,) S. Wilmot 136,399
Cigars, treating and drying, (160,) J. Cuddy 136,490
Coil springs, manufacture of, (170,) W. H. Ward 136,473
Comb, band, (161,) E. Brown 136,258
Cooking vessel, (68,) W. Y. Thomson 136,467
Croquet mallet, (143,) E. A. Ross 136,209
Culinary purposes, crusher and press for, (28,) G. B. Fowler 136,498
Cultivator, (43,) B. F. Brate 136,409
Cultivator, (43,) L. M. Ganong 136,500
Cultivator, (43,) E. Wiard 136,574
Cultivator, (43,) W. Willerton 136,477
Digger, potato, (114,) H. B. Norton 136,536
Docks, building, (82,) Thompson and Pattison 136,560
Door spring, (94,) G. Geer 136,371
Door and gate spring, (94,) Bean and Mills 136,483
Doors, &c., machine for relishing, (173) F. D. Green 136,503
Dovetailing machine, (173,) J. E. Haskell 136,374
Drill teeth, (133,) S. Black 136,408
Elevator, water, (116,) Erwin and Shoalters 136,366
Engines, slide valve for steam, (152,) J. Nesbitt, (reissue) 5,310
Excelsior machine, (173,) W. H. Mayo 136,529
Fence post, (52,) J. M. Beebe 136,406
Fences, apparatus for stretching wire, (52,) J. T. Mangham 136,398
Filter, water, (167,) W. M. Conger 136,364
Fire kindler, (154,) C. A. Nisbett 136,451
Fire-proof building, (4,) A. E. Holte 136,515
Fire pips for buildings, stationary, (167,) H. Palmieri 136,537
Float, peg, (16,) P. A. Schoellhorn 136,551
Floor clamp, (39,) J. J. Foster 136,498
Food, artificial, (53,) H. C. Morris 136,447
Fuel from coal waste, manufacture of, (61,) J. R. Hayes 136,375
Furnace and furnace door, (142,) B. R Hawley 136,509
Furnace, steam boiler, (140,) M. A. Foster 136,497
Furnace for reheating metals, (85,) H. Chisholm 136,413
Furnace and steam generator for heating, (142,) B. R. Hawley 136,510
Furnaces, lining rotary puddling, (85,) S. Danks 136,421
Furniture, school, (62,) J. L. Ritter 136,548
Furniture, spiral spring for, (62,) H. Hard 136,507
Gas illuminator, (64,) J. B. Van Patten 136,565
Gear cutting machine, (100,) J. W. Foster 136,429
Generator, ozone, (66,) R. Heneage 136,511
Generator, ozone, (66,) R. Heneage 136,512
Generator, oil burning steam, (148,) O. W. Ketchum 136,521
Grain and seed, apparatus for protecting, (58,) J. M. Jeannides 136,437
Hand rest, (146,) J. Belford 136,257
Harness, check loop for, (72,) W. Parsons 136,454
Harness hames, guard for, (74,) C. H. Allen 136,403
Harrow, sulky, (73,) G. W. Van Gorder 136,534
Harvester dropper, (74,) J. B. Gathright 136,370
Hatchet blanks, die for shaping, (49,) J. Yerkes 136,479
Head rest, (62,) O. M. Mitchell 136,511
Heater, gas, (65,) C. H. Prentiss 136,381
Hogsheads and heavy barrels, apparatus for moving and rolling, (79,) F. O. J. Burr 136,486
Holder, tool, (39,) I. F. Murch 136,439
Horseshoes, calk for, (60,) J. J. Mervesp 136,379
Hose coupling, (167,) G. Westinghouse, Jr 136,397
Hub, vehicle, (31,) Royer and Rouse 136,459
Hydrant, (167,) T. Ragan 136,545
Ice cream freezer, (58,) S. S. Fitch 136,496
Iron, smoothing, (91,) A. B. Wimpenny 136,401
Ironing apparatus, (91,) R. A. Tyler 136,471
Jack, lifting, (79,) T. W. H. Moseley 136,533
Jar, fruit, (58,) H. Hering 136,513
Kettle, tea, (154,) C. D. Woodruff 136,576
Kiln, brick, (30,) Walsh and Taylor 136,568
Knife and fork, folding, (44,) H. Schumacher 136,538
Knife and sprig box, combined putty, (107,) J. H. Gaches 136,499
Knitting machine, (69,) J. M. Armour 136,480
Lamp, (90,) F. A. Flanagin 136,487
Lamp, (90,) G. H. Simmons 136,553
Lamp, (90,) White and Knight 136,573
Lamp, street, (90,) F. Hartmann 136,373
Latch and lock combined, (93,) G. Müller 136,448
Lead, manufacture of white, (107,) A. P. Meylert 136,440
Leather belts, clasp for, (23,) L. Sanders 136,549
Lever for presses, (7,) J. P. Gate 136,431
Life preserving float, (136,) T. Hosmer 136,436
Liquids, apparatus for cooling, (58,) H. Meidinger 136,445
Link, (60,) R. C. Schenck, Jr 136,550
Loom shuttle motion, (95,) A. Gartenmann 136,501
Loop for harness, check, (72,) W. Parsons 136,451
Medical compound, (98,) A. B. Simpson 136,554
Medicated towel, (98,) L. Stewart 136,466
Meter, water, (167,) E. E. P. Clausolles 136,363
Metronome, (36,) J. A. Heckenbach 136,435
Milk and cream, apparatus for cooling, (45,) Prince and Martin 136,542
Mill, smut, (57,) A. D. Ash 136,356
Mill for grinding barley, (57,) J. Mackay 136,527
Millstones, machine for dressing, (57,) F. A. Hoyt 136,517
Mortar mixer, (153,) C. W. Wasson 136,571
Mosquito net frame, (62,) Petersen and Roescher 136,456
Mowing machine, (74,) H. Michaux 136,380
Nail, picture, (103,) G. Vintschger 136,568
Nails, machine for arranging, (103,) A. Knowlton, (reissue) 5,313
Neck tie supporter, (36,) E. Pelts 136,538
Nut locking device for railroad rail joints, (130,) A. McKenney, (reissue) 5,308
Oil still, (47,) Stewart and Dubier 136,557
Oven, baker's, (6,) Rayney and Cairns 136,546
Pavement, wood, (110,) C. Wheeler, Jr 136,572
Pessary adjuster, (156,) O. M. Muscaster 136,449
Photographic negative, (111,) J. Kirk 136,439
Pipe coupling, (167,) J. Conner 136,365
Pipe, cigar shaped, (160,) S. N. Buyuktzky 136,487
Pipes, swing joint for, (167,) Worswick and Lewis 136,577
Piston packing, (151,) Babbitt and Harris 136,405
Plaiting machine, box, (38,) O. M. Chamberlain 136,362
Plane, carpenter's, (29,) J. A. Traut 136,461
Plow, (114,) N. Burch 136,360

Plow irons, machine for making, (114,) McGinty and Nolan 136,444
Police nippers, (144,) Craig and Haughey 136,419
Press, cotton, (7,) J. P. Derden 136,422
Pump nozzle, (118,) C. O. Wilcox 136,473
Pump, steam vacuum, (118,) J. R. Little 136,441
Railroad rail, (120,) A. McKenney, (reissue) 5,307
Railroad rail chair, (121,) D. D. Eldridge 136,426
Railroad rail joint, (120,) M. F. McIntyre 136,530
Railroad rails, splice for, (120,) H. P. Adams 136,403
Rake and tedder combined, (77,) S. Perry 136,539
Refrigerating apparatus for vessels, railway cars, &c., (121,) W. Bray 136,484
Roofing, (126,) J. H. Hood 136,516
Sad iron, (91,) G. W. C. Lovell 136,518
Sad and fluting iron, (88,) J. Hewitt, (reissue) 5,303
Salt in cruets, agitating, (88,) F. B. Richardson 136,386
Sash balance, (94,) J. J. Cowell 136,366
Sash balance, (94,) J. M. Simpson 136,461
Saw mill, (130,) D. C. Prescott 136,541
Saw mill, circular, (130,) L. C. Pattee, (reissue) 5,303
Saw set, (131,) J. W. Leslie 136,131
Sewing machine, scroll, (130,) G. S. Grigg 136,473
Sewing staves, machine for, (40,) N. J. Templeton 136,559
Sewing machine, (134,) W. C. Hicks, (reissue) 5,305
Sewing machine binder, (134,) E. H. Alexander 136,354
Sewing machine braiding attachment, (134,) E. H. Alexander 136,335
Sewing machine cover, (134,) C. B. Grover 136,506
Sewing machine hemmer, (134,) H. A. Ellis 136,343
Sewing machine table, (134,) S. J. Pusey 136,543
Sewing machine tray, (134,) G. A. Kirchner 136,525
Sewing machine treadle, (134,) C. J. F. Kraft 136,377
Sewing machine for working button holes, (134,) Howard and Jackson, (reissue) 5,306
Sewing machine needles, machine for grooving, (104,) Freimuth and Büttner 136,430
Sewing machine tables, attachment for, (134,) M. A. Browne 136,410
Sewing machines, water wheel attachment for, (168,) C. H. Palmer 136,452
Shears for counters, (44,) N. Stow 136,558
Shipping mechanism for machinery, (67,) F. N. Bixby 136,483
Ships, construction of, (137,) A. W. Thompson 136,393
Shoes, cutting out uppers for, (16,) E. H. Thurston 136,561
Shuttle binder, (95,) F. Rea 136,394
Skirt, hoop and train, (80,) L. Guelle 136,434
Soda, manufacture of carbonate of (98,) E. Solvay 136,463
Soldering tool, (138,) L. Cutting 136,367
Spindle, lubricating, (57,) J. Goulding 136,504
Stamp, hand, (146,) G. H. Rountree 136,458
Steam and air brake, (122,) Smith and Frink 136,462
Steam power brake coupling, (87,) J. Westinghouse, Jr. 136,396
Steamboat chimneys, operating, (138,) J. Christy 136,414
Steering apparatus, (139,) J. F. Sparr 136,464
Stereotype plates, machine for making matrices for, (164,) J. A. Marques 133,442
Street sweeper, (110,) O. W. Kellogg 136,438
Stone, machine for turning, (153,) A. S. Gear 136,432
Stove, heating, (154,) J. Spear, (reissue) 5,314
Stove, portable, (154,) G. B. Isham 136,521
Stoves, device for emptying, (154,) B. Connelly 136,418
Table, dining, (62,) G. L. Motter 136,381
Table, lap board, and step ladder, combined ironing, (91,) H. C. Smith 136,390
Tallow, apparatus for rendering, (26,) P. W. Dalton 136,420
Tanning, (62,) Carter and Keith 136,484
Telegraph, duplex, (50,) J. C. Wilson 136,400
Telegraph, printing, (50,) M. Gally 136,369
Tinners' clippings, treating, (99,) F. G. Morton 136,532
Tires, machine for upsetting, (66,) C. J. Peterson 136,455
Tobacco pouch, (109,) D. Read 136,457
Trap, animal, (143,) J. Krummenacher 136,378
Trunk spring, (156,) J. W. Riggs 136,387
Tumbler, jelly, (88,) W. Doyle 136,492
Valve, hydraulic, (152,) T. Critchlow 136,429
Valve, slide, (138,) J. Nesbitt, (reissue) 5,309
Valve for steam engines, slide, (158,) J. Nesbitt, (reissue) 5,310
Vault cover, (110,) T. Hyatt 136,519
Vehicle wheel, (31,) J. L. Dom 136,425
Vehicle wheel, (31,) S. B. Hindman 136,376
Vehicle wheel, (31,) S. Vreeland 136,567
Vehicles, bolster spring for, (31,) H. Buck 136,360
Ventilating underground and subsurface railways, (120,) O. Vandenburgh 136,563
Vessels, propelling mechanism for, (139,) J. Welch 136,475
Vessels by steam, apparatus for steering, (133,) W. W. Dungan 136,493
Washing machine, (91,) C. Watson 136,474
Water wheel, turbine, (168,) J. Harris 136,372
Wells, adjustable valve for bored or driven, (52,) M. T. and M. C. Chapman 136,412
Whip socket, (31,) Coe and Merritt 136,417
Windlasses, operating, (78,) P. Philip 136,304

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 4, 1873.

Adams, H. P., Splice for railroad rails 136,354
Alexander, E. H., Braider for sewing machines 136,354
Alexander, E. H., Braiding attachment for sewing machines 136,355
Allen, C. H., Guard for harness hames 136,403
Armour, J. M., Knitting machine 136,480
Ash, A. D., Smut mill 136,356
Atwood, A. N., Composition for burial caskets 136,404
Avery, B. F., assignee 136,574
Babbitt, G. E., and W. A. Harris, Piston packing 136,405
Baldwin, G., Brick and tile machine 136,481
Baldwin, J. L., assignee 136,488
Bean, S. L., and L. Mills, Door and gate spring 136,493
Beebe, J. M., Fence post 136,406
Belford, L., Hand rest 136,357
Beschke, W., Construction of buildings 136,407
Bixby, F. N., Shipping mechanism for machinery 136,483
Black, S., Drill teeth 136,561
Boyd, R., assignee 136,488
Brate, B. F., Cultivator 136,409
Bray, W., Refrigerating apparatus for vessels, &c 136,484
Brigham, C. P., assignee, (reissue) 5,306
Brooks, J. W., trustee, assignee 136,503
Brown, E., Band comb 136,358
Brown, W. B., assignee 136,454
Brown, Harris & Hopkins, assignees 136,482
Browne, M. A., Attachment for sewing machine tables 136,410
Buck, H., Railway car 136,359
Buck, H., Bolster spring for vehicles 136,360
Bunster, H. B., Cigar bunching machine 136,411
Burch, N., Plow 136,361
Burchardt, C. T., Centrifugal machine 136,485
Burr, F. O. J., Apparatus for moving and rolling hogsheads, &c 136,486
Büttner and Freimuth 136,430
Buynitzky, S. N., Cigar shaped pipe 136,487
Cairns and Rayney 136,546
Carrington, W. B., assignee 136,362
Carter, J., and A. Keith, Tanning 136,488
Chamberlain, O. M., Box plaiting machine 136,362
Chapman, M. T. and M. C., Adjustable valve for bored or driven wells 136,412
Chisholm, H., Furnace for reheating metals, &c 136,413
Christy, J., Operating steamboat chimneys 136,414
Claes, W. F., Bung 136,415
Clausellee, E. E. P., Water motor 136,363
Claussen, F. W., Barrel support 136,416
Codding, A. E. and D. D., assignees, (reissue) 5,311
Coe, D. W., and D. Merritt, Whip socket 136,417
Conger, W. M., Water filter 136,364
Connelly, B., Device for emptying stoves 136,418
Conner, J., Pipe coupling 136,365
Cottrell, T. D., assignee 136,415
Cowell, J. J., Sash balance 136,366
Craig, J. B., and M. Haughey, Police nipper 136,419
Critchlow, T., Hydraulic valve 136,429
Cuddy, J., Treating and drying cigars 136,490
Curtis, J., assignee 136,356
Cutting, L., Soldering tool 136,367
Dalton, P. W., Apparatus for rendering tallow, &c 136,420
Danks, S., Lining rotary puddling furnaces 136,5.7
Dean, Smith & Co., assignees 136,488
Dederick, L., assignee 136,493
Derden, J. P., Cotton press 136,423
Dick, W., Bottle washer 136,491
Dobson, H. C., Banjo 136,492
Dodge, J. M., Car axle box 136,425
Dom, J. L., Vehicle wheel 136,493
Doyle, W., Jelly tumbler 136,557
Dubier and Stewart 136,493
Dungan, W. W., Apparatus for steering vessels by steam 136,494
Dunlap, S., Spring bed bottom 136,441
Dunn, C. A., assignee 136,496
Eldridge, D. D., Railroad rail chair 136,495
Ellis, H. A., Hemmer for sewing machines 136,368
Erwin, J. B., and G. H. Shoulters, Water elevator 136,559
Ezekiel, H. C., assignee 136,496
Fitch, S. S., Ice cream freezer 136,427
Flanegin, F. A., Lamp 136,498
Foster, J. J., Floor clamp 136,429
Foster, J. W., Gear cutting machine 136,497
Foster, M. A., Steam boiler furnace 136,498
Fowler, G. B., Crusher and press for culinary purposes 136,541
Freeman, W. A., assignee 136,430
Freimuth, H., and A. Büttner, Machine for grooving sewing machine needles 136,461
Frink and Smith 136,499
Gaches, J. H., Combined putty knife and sprig box 136,369
Gally, M., Printing telegraph 136,500
Ganong, L. M., Cultivator 136,501
Gartenmann, A., Loom shuttle motion 136,431
Gates, J. P., Lever for presses 136,370
Gathright, J. S., Harvester dropper 136,432
Gear, A. S., Machine for turning stone 136,371
Geer, G., Door spring 136,502
Gerhardt, C. C., Car ventilator 136,503
Glidden, C. W., Machine for pricking and nail loading boot and shoe heels 136,503
Goulding, J., Lubricating spindle 136,504
Green, F. D., Machine for relishing doors, &c 136,505
Greene, E. A., assignee 136,429
Grigg, G. S., Scroll sawing machine 136,433
Grove, W. H., assignee 136,543
Grover, C. B., Sewing machine cover 136,506
Guelle, L., Hoop and train skirt 136,434
Hard, H., Spiral spring for furniture 136,507
Harper, C. A., Floor bolt 136,508
Harris, J., Turbine water wheel 136,372

Harris and Babbitt 136,405
Hartmann, F., Street lamp 136,373
Haskell, J. E., Dovetailing machine 136,374
Haughey and Craig 136,419
Hawley, B. R., Furnace and furnace door 136,509
Hawley, B. R., Furnace and steam generator for heating 136,510
Hayes, J. R., Manufacture of fuel from coal waste 136,375
Hazard, T. H., assignee 136,447
Heckenbach, J. A., Metronome 136,435
Henecge, R., Ozone generator 136,511
Heneage, R., Ozone generator 136,512
Hering, H., Fruit jar 136,513
Herron, W. M., Cigar tip 136,514
Hewitt, J., Sad and fluting iron, (reissue) 5,302
Hicks, W. C., Sewing machine, (reissue) 5,305
Hill, J., trustee, assignee, (reissue) 5,313
Hindman, S. B., Vehicle wheel 136,374
Holte, A. E., Fire-proof building 136,515
Hood, J. H., Roofing 136,516
Hooton, F. C., assignee 136,375
Hosmer, T., Life preserving float 136,436
Howard, E., and W. H. Jackson, Sewing machine for working button holes, (reissue) 5,306
Hoyt, F. A., Machine for dressing millstones 136,517
Hughes, W. L. B., assignee 136,415
Humans, W., Electro magnetic annunciator 136,518
Hyatt, T., Vault cover 136,519
Irwin, D. J., Brick machine 136,520
Isham, G. B., Portable stove 136,521
Jackson and Howard, (reissue) 5,308
Joannides, J. M., Apparatus for protecting grain and seed 136,437
Johnson, J., Furniture caster 136,522
Jones, J. W., Car coupling 136,523
Keith and Carter 136,488
Kellogg, O. W., Street sweeper 136,438
Kendrick and Ogborn 136,363
Ketchum, O. W., Oil burning steam generator 136,524
Kirchner, G. A., Tray for sewing machines 136,525
Kirk, J., Photographic negative 136,439
Kitsmiller, E. A., assignee 136,490
Knight and White 136,573
Knowlton, A., Machine for arranging nails, (reissue) 5,313
Kraft, C. J. F., Treadle for sewing machines 136,377
Krummenauer, J., Animal trap 136,378
Leslie, J. W., Saw set 136,440
Lewis and Worswick 136,577
Little, G. A., assignee 136,517
Little, J. R., Steam vacuum pump 136,441
Loryea, A. M., assignee 136,458
Lothrop, H. A., assignee, (reissue) 5,315
Lovell, G. W. C., Sad iron 136,526
Mackay, J., Mill for grinding barley 136,527
Mangham, J. T., Apparatus for stretching wire fences 136,528
Marques, J. A., Machine for making matrices for stereotype plates 136,442
Martin and Prince 136,542
Matthews Bros., assignees 136,376
Maule and Pancoast 136,453
May, C., Bureau or wardrobe bedstead 136,443
Mayo, W. H., Excelsior machine 136,529
McDermott, J. J., assignee 136,490, 136,514
McGinty, J. M., and T. Nolan, Machine for making plow irons 136,444
McIntyre, M. F., Railroad rail joint 136,530
McKenney, A., Railroad rail, (reissue) 5,307
McKenney, A., Nut locking device for railroad rail joints, (reissue) 5,308
Meidinger, B., Apparatus for cooling liquids, &c 136,445
Merritt and Coe 136,417
Mervesp, J. J., Calk for horseshoes 136,379
Metallic Suspension Wheel Company, assignee 136,567
Meylert, A. P., Manufacture of white lead 136,446
Michaux, H., Mowing machine 136,380
Mills and Bean 136,493
Mitchell, O. M., Head rest 136,531
Morris, H. C., Artificial food 136,447
Morton, F. G., Treating tinners' clippings 136,532
Moseley, T. W. H., Lifting jack 136,533
Motter, G. L., Dining table 136,381
Millar, G., Combined latch and lock 136,448
Muncaster, O. M., Pessary adjuster 136,449
Murch, I. F., Tool holder 136,450
National Wire Mattress Company, assignee, (reissue) 5,310
Naylor, H., Bottle and bottle stopper 136,534
Nellis, A., assignee 136,521
Nemeta, L., Billiard cue 136,535
Nesbitt, J., Slide valve, (reissue) 5,309
Nesbitt, J., Slide valve for steam engines, (reissue) 5,310
Nisbett, C. A., Fire kindler 136,451
Nolan and McGinty 136,444
Noss, J. and J., assignees 136,364
Norton, H. B., Potato digger 136,536
Ogborn, H., and A. W. Kendrick, Bed bottom 136,363
Palmer, C. H., Water wheel attachment for sewing machines 136,452
Palmieri, H., Stationary fire pipe for buildings 136,537
Pancoast, H. B., and F. I. Maule, Sectional steam boiler 136,453
Parsons, W., Check loop for harness 136,454
Pattee, L. C., Circular saw mill, (reissue) 5,303
Pattison and Thompson 136,539
Pelts, E., Neck tie supporter 136,538
Perry, S., Combined rake and tedder 136,539
Peterson, N., and R. Roseshor, Mosquito net frame 136,454
Peterson, C. J., Machine for upsetting tires 136,455
Philip, P., Operating windlasses, (reissue) 5,304
Porter, C., Car coupling 136,540
Prentiss, C. H., Gas heater 136,383
Prescott, D. C., Saw mill 136,541
Prince, J., and M. D. Martin, Apparatus for cooling milk and cream 136,542
Pusey, S. J., Sewing machine table 136,543
Quinby, A. P., Oil can 136,544
Ragan, T., Hydrant 136,545
Randle and Heath 136,555
Rayney, J., and W. Cairns, Baker's oven 136,546
Rea, F., Shuttle binder 136,394
Read, D., Tobacco pouch 136,457
Reinking, C. D., Wash boiler attachment 136,395
Replogle, S. B., Car coupling 136,547
Richardson, F. B., Agitating salt in cruets 136,386
Riggs, J. W., Truss spring 136,387
Riter, J. L., School furniture 136,548
Roescher and Petersen 136,456
Rose, E. A., Croquet mallet 136,388
Rountree, G. H., Hand stamp 136,458
Rouse and Royer 136,459
Royer, T., and G. L. Rouse, Vehicle hub 136,459
Rutter, J., assignee 136,375
Sanders, L., Clasp for leather belts 136,549
Schenck, R. C., Jr., Link 136,550
Schirck, A. and J., and J. Smith, Manufacture of carriage axles 136,460

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. Fifty-two volumes per year (an issue takes place every Tuesday) was found to fill up the shelves of the libraries so fast as to make the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office; and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within hat time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 3.—NO. 10. TUESDAY, MARCH 11, 1873. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D.C.

NOTICE.

In the revised edition of the Rules of Practice of the United States Patent Office, published March 24, 1873, the following rules have been amended, to which attention is specially called:

Rule 2, 3, 9, 10, 12, 15, 19, 24, 26, 27, 28, 29, 31, 33, 34, 35, 36, 39, 43, 44, 45, 49, 51, 52, 53, 57, 58, 59, 63, 67, 70, 72, 73, 78, 84, 85, 86, 87, 93, 96, 97, 98, 99, 103, 105, 112, 113, 116, 118, 119, 120, 121, 133, 136.

COMMISSIONER'S DECISIONS.

COLLENDER *vs.* GRIFFITH.—*Interference.*

[*Appeal from the decision of the Primary Examiner in the matter of the interference between the application of H. W. Collender and the design patent of W. H. Griffith, granted October 24, 1871, for* IMPROVEMENT IN BILLIARD-TABLES.—*Decided March* 11, 1873.]

DESIGN PATENTS—MECHANICAL PATENTS—PRACTICE IN INTERFERENCES.

An interference should be declared between an application for a mechanical patent and a design patent which shows the alleged invention, although the applicant holds a prior design patent showing the same.

If the designs embraced in the two patents are so dissimilar as not to be in conflict, it is unnecessary to include the earlier patent in the interference.

The burden of proof is on the applicant for the mechanical patent, notwithstanding his design patent first shows the invention; but he may have the benefit of it by introducing it in evidence.

LEGGETT, *Commissioner:*

This is a motion to dissolve the interference. The case is somewhat anomalous. Collender obtained a patent for a design for an ornamental billiard-table frame June 6, 1871. On October 6, 1871, a design patent was granted to Griffith, also for an ornamental billiard-table frame. The two designs, as such, are distinctly dissimilar. There was no interference between them as designs, and they were properly patented. January 16, 1872, Collender filed his present application for a patent, claiming to be the inventor of a beveled frame for billiard-tables, which is alleged to be a material practical improvement upon the square vertical-sided frame in common use. The beveled frame was shown in his design patent and in that of Griffith. Having in itself, however, a practical, useful function, without regard to any particular ornamental configuration or design, it was held—following the practice adopted in the Bartholomew case, Commissioner's Decisions, 1871, p. 298—to be proper subject-matter for a mechanical patent. An interference became necessary to determine which of the parties, Collender or Griffith, was the inventor of the beveled frame. In it Collender's design patent was not embraced, and the question now is whether or not it should have been. The invention now claimed can never be secured to Collender or his representatives by reissue of that design patent. This is true also as to Griffith's design patent. The question is which of the parties is entitled to a mechanical patent upon separate application therefor, or, more immediately, whether or not Collender is upon his application. It is his application that raises this issue, and not his design patent. To be sure, he is alleged to be the inventor of both the design and the mechanical construction he shows, which are substantially identical in both his cases. But inasmuch as he cannot secure protection for the latter in his design patent by reissue, it is not necessary to place that patent in interference with his own application. That would be allowed without an interference were it not that *another inventor* shows the subject-matter claimed. Neither is it necessary to place it in interference with Griffith's design patent, because the two designs, as such,

do not interfere. The case is not altered by assuming that Collender's design patent may be in the hands of assignees whose interests might be affected. They could never have an interference either with Griffith's design or Collender's mechanical patent, should he obtain one. Questions which might arise between them and Collender, growing out of the grant to him of the patent he now seeks, would be of a different nature and come before another tribunal. If Griffith should be awarded priority he may file a new application and obtain a patent without obstruction from Collender's design patent. The fact that the burden of proof is upon Collender in this instance arises, under the rules, from the record, and I see no reason why the rules should be modified in his favor. He can put in his design patent as evidence, and thus avail himself of it. But there is no reason why it should be embraced in this interference, and therefore there is none for relieving him of the burden of proof which he sustains upon the records in the cases which are actually and necessarily in interference.

The Examiner's decision is sustained.

GEO. W. NESMITH.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Geo. W. Nesmith for patent for* GRAIN-REGISTERS, *filed February* 7, 1872.—*Decided March* 21, 1873.]

ARRANGEMENTS OF DEVICES: GENERAL SIMILARITY—SPECIFIC DIFFERENCES.

A claim for the specific construction and arrangement of the devices by which the registration is effected in a grain-register, should not be rejected on reference to a register for stills constructed on the same general principle, and accomplishing essentially the same result, but by devices materially different in the construction and arrangement of their parts.

LEGGETT, *Commissioner:*

This device consists of a spring-lever carrying a pawl which engages with the first of a series of numbered ratchet-wheels geared so that one revolution of the first wheel advances the second one notch, and one revolution of the second advances the third one notch. The wheels are numbered to exhibit units, tens, and hundreds, and are so arranged that the numbers are exhibited and indicate the quantity of grain that has passed the apparatus. The spring-lever projects into the path of the buckets or measures which are passing and conveying grain from one receptacle to another, and is tripped by each bucket, advances the unit-ratchet one notch, and returns again to place. The special arrangement of springs, lever, and pawl to move these registering-wheels constitutes the alleged invention.

The reference cited by the Examiner presents a register for stilts constructed upon the same principle and accomplishing essentially the same results so far as mere registration is concerned. The specific construction and arrangement of the parts of the respective devices for moving the registering-wheels are, however, materially different. They accomplish the same result in the same general way, just as the different sewing-machines forming the same stitch do; but in their details they are as different as are the details of such machines for performing the same minor functions in the operation of sewing.

The claim covers a specific construction and arrangement of parts which operate together to cause the registration. Although the same general result is accomplished by the mechanism shown in the reference, that mechanism is not the same, and, I think, not the mechanical equivalent of what is claimed. It may be better or worse, but at any rate it is materially different, and I think the applicant is entitled to a claim for it.

Had he embraced in his claim the spring that retracts the lever, which is really essential to the operation of the combination he specifies, there would be no doubt but that his claim should be allowed. With this suggestion of amendment the decision of the Board is overruled.

B. B. KEYES.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of B. B. Keyes for patent for* MODE OF TESTING PRESSURE-GAGES.—*Decided March* 21, 1873.]

NOVELTY.

Bourdon's pressure-gages have usually been tested by applying weights to them while under steam-pressure; and there is no novelty in testing them by weights while they are not under such pressure.

LEGGETT, *Commissioner:*

The only difference between applicant's method and that shown in the reference cited by the Examiner is, that applicant proposes to test the pressure of the well-known Bourdon pressure-gage by means of weights when no steam pressure is being exerted, while the old method is to apply the weights while the steam pressure is being exerted. The method in each case is precisely the same, but the condition of the gage to be tested is different, as it is effected in one case or the other by the presence or absence of the steam pressure. It is asserted that by the old method the results of measurements or tests are inaccurate; but I am unable to understand upon what principle applicant's method is calculated to remedy such inaccuracy.

If the steam pressure is counterbalanced or taken into account in connection with the weights, as indicated upon the dial-plate, the result, it would seem, must be substantially the same as if there were no steam pressure. The test in either case, I presume, could only be approximately accurate; but I see no reason why it would not be as accurate in one case as the other, as the two methods are substantially the same. I concur with the opinion of the Board that the reference anticipates the claim.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

GEORGE C. ROBERTS *vs.* JOSEPH BLAKE, JR.

[*In Equity.—Before Shepley, J.—Decision March* 11, 1873.]

EVIDENCE: NOTICE UNDER THE STATUTE.

Where evidence that the invention was not new was taken under objection because no notice was given of it in the answer, it will not be received, although the answer is afterward amended so as to include such a notice.

The parties having agreed that if the amendment were allowed the testimony might be received as if taken under the amended answer, it was admitted upon terms that the defendant should tax no costs up to the hearing.

Roberts vs. Herndon, 2 Cliff., 503, and *Roberts vs. Dodge*, U. S. Cir. Ct., So. D. N. Y., cited and approved.

The patent of D. W. C. Sanford, November 13, 1855, reissued April 21, 1857, and extended for seven years, held void for want of novelty.

[*Thomas A. Jenckes* and *Richard Stone*, for complainant.
Causten Browne and *Jabez S. Holmes* for defendant.]

SHEPLEY, *J.:*

This is a bill in equity to recover profits and damages for alleged infringement of letters patent granted to D. W. C. Sanford, November 13, 1855, reissued April 21, 1857, and extended October 21, 1869, for an improvement in refrigerators, the interest in the letters patent being now owned by the complainant.

The principal question in the case is as to the novelty of Sanford's invention. A preliminary question arises, and must first be determined, on the motion to amend the answer. Evidence had been taken in the case of the caveat of A. S. Lyman in 1852, of the grant of a patent to him in 1856, and as to the use of the Lyman patent before the date of the invention by Sanford. The answer was defective in not naming the caveat or the grant of letters patent to Lyman, or in stating, as required by the act of 1870, section 61, *by whom* the alleged invention of Lyman had been used. A motion was made to amend the answer to let in this evidence. The Court ruled, correctly, that such amendment would not make that testimony admissible which was taken under objection before the answer was amended. When the evidence was taken, which was inadmissible under the answer as it originally stood, the adverse party had a right to rely upon his objections and elect not to cross-examine or offer rebutting proofs. Parties agree, however, in this case, if the Court decides to grant the amendment, that the testimony taken before the allowance of the amendment may be considered as in the case to the same extent as if taken under the amended answer. Considering that the omission in the answer was evidently by inadvertence of the counsel in New York, and that the complainant is not taken by surprise, under all the circumstances of the case, the amendment is allowed upon terms, but as it was offered at so late a stage of the proceedings in the cause, the defendant is not in any case to recover costs up to the time of the hearing in the case.

The claims in the Sanford patent have been fully and clearly construed by the Court in the case of *Roberts* vs. *Herndon*, 2 Clifford, p. 503. Upon a careful examination of the evidence in this case, I am of opinion that the conclusion of Judge Blatchford in the case of *Roberts* vs. *Dodge*, in the Second Circuit and Southern District of New York, is correct; that the inventions of Sanford and the claims of his patent are fully anticipated, on the point of novelty, by the refrigerators constructed under Lyman's direction, at the Novelty Works in New York, in 1854.

These refrigerators, including also Exhibit Hedden No. 1, contain the same combination of elements named in Sanford's first claim. There are some slight structural differences. The elements of the combination are somewhat modified in their form, but the combination of the same elements produces in substance all the results and the same results claimed by Sanford.

Bill dismissed without costs.

U. S. CIRCUIT COURT—EASTERN DISTRICT OF NEW YORK.

WM. H. BLISS *vs.* THE CITY OF BROOKLYN.

[*In Equity.—Before Benedict, Judge.—Decision March* 13, 1873.].

COMBINATIONS NON-EFFECTIVE.—EFFECTIVE.

A patent for a combination of devices which proves to be inoperative and worthless is void.

The addition to a combination which is inoperative and worthless in itself, of an element which renders it practicable and valuable, constitutes a new combination, and is something more than a mere improvement upon the old one.

The use of a patented combination which is in itself inoperative and worthless, in connection with a new element which renders it practical and useful, cannot be punished as an infringement.

[*George Gifford*, for complainant.
B. F. Valentine, for defendant.]

BENEDICT, *Judge:*

This action, which has been before me on a former occasion upon other pleadings and proofs having been reopened, now comes up for determination upon new pleadings and different proofs. It is an action to recover damages of the city of Brooklyn for using certain hose-couplings, which are claimed to be an infringement upon a certain patent for hose-couplings originally issued to Robert B. Lawton and William H. Bliss, on the 22d day of February, 1859; reissued December 21, 1869; and now owned by the plaintiff.

The object of the invention is stated in the original patent, as follows:

"The object of this invention is to connect hose together in such a manner that a swivel-joint will be attained, and at the same time certain provision made for compensating for the wear attending such connection, so that the coupling may always be kept water-tight by the mere act of adjusting or connecting the parts together."

The claim of the original patent is as follows:

"The two thimbles C D, attached to the end of the hose A B, the thimble C being provided with the shoulder *b* and ground seat or packing *c*, and the thimble D provided with the groove *e* with inclined sides and fitted within thimble C, the above parts being used in connection with the conical roller or rollers *g* fitted in the screw-cap *f*, and the whole arranged to operate as and for the purposes set forth."

In the reissue, upon which this suit is based, the object of the invention is stated as follows:

"The object of this invention is to connect hose together in such a manner as to secure a tight joint, and admit of their being connected with greater facility than was previously done."

The claim in this reissue, which is the object of this controversy, is as follows:

"The combination of the two thimbles C and D, by means of a pin operating longitudinally through the outer thimble C and against the inclined side of the groove in the thimble D, so that the two thimbles will be forced together by the inward movement of the pin and be liberated by its outward movement, substantially as described."

It will be observed that the idea which is put forth in the original patent as the new idea embodied as there described—namely, the formation of a hose-joint which, by means of a revolving pin, could swivel and at the

same time remain tight—is omitted from the reissued patent.

In the reissue the only object of the invention as there stated, is the formation of a tight hose-joint, by means of the combination of certain old and well-known devices, in the manner described.

In opposition to the patent as thus reissued, several grounds of defense have been here taken. One of them is that the invention which the reissued patent describes is worthless and the patent invalid; and this defense appears to me to be supported by the proof. The law upon the subject of utility is not in doubt. No particular amount of utility is required to render an invention patentable, but there must be some. When the invention is shown to be worthless the patent must fail. Such appears to be the case in the present instance. The evidence fails to disclose any instance where the combination described in the reissued patent of 1869 has been successfully used. The plaintiff himself testifies that he does not know of any such coupling having been found to be of practical use. Although he sells couplings, he never sold *any such*, and only recollects three instances where their use has been attempted. His testimony satisfies me that the combination described in the patent here relied on proved inoperative and worthless.

It is true that couplings containing all the elements in combination which are described in the plaintiff's reissue of 1869 are in use, and such are those used by the defendant, but in these couplings another essential element is present in the combination, which additional element is not to be found in the plaintiff's reissue of 1869.

This additional feature is a lug, which is placed upon the inside of the outer thimble opposite to the pin in such a manner that when the pin is forced inward upon the inner thimble the inclined side of the groove of that thimble is pressed upon the lug, and that part of the inner thimble thus forced up to the shoulder of the outer thimble, at the same time that the pin itself, by pressing the inclined groove when it is touched by the pin, forces that side of the inner thimble up to the shoulder of the outer thimble, thus making a tight joint which cannot tilt, although the inner thimble be smaller than the inside of the outer thimble, and which cannot swivel or turn and be tight.

The introduction of this element makes the combination a different combination from that described in the plaintiff's patent of 1869. This combination, in which the lug enters as an element, is the subject of another patent obtained by the plaintiff in 1862, which he has not proved here, and in which he states that the lug is "*very essential.*"

This latter patent of 1862 has been put in evidence by the defense, and it affords strong support to the position that the combination described in the reissue of 1869 proved worthless.

But it is said the introduction of the lug is simply an improvement. I cannot so consider it. The two combinations are distinct, because they have different elements and attain a different result. In the one combination no lug appears, and no practical result is attained. The introduction of the lug for the first time produced a combination which accomplished any useful result. An added element which increases the efficiency of a combination, of itself effective, is of the nature of an improvement; but when the added element is essential to the production of any useful result such an addition is not an improvement, but its use gives birth to the only patentable (because the first useful) combination. Notwithstanding, then, the conceded fact that the combination which includes the lug, with other elements, which are described in the reissue of 1869, is useful, it is nevertheless necessary, in order to sustain the reissue, that it should appear that the device there described, which does not contain the lug, is of some utility. As before stated, the contrary here appears, and for this reason the patent must be declared invalid.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,291.—*Metallic Bands for Baling.*—Granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869. Hearing March 5, 1873.

23,309.—*Bredopes.*—Granted to SIMON E. PETTES, March 22, 1859. Hearing March 5, 1873.

23,316.—*Instruments for Enlarging Photographs.*—Granted to DAVID SHIVE, March 22, 1859. Hearing March 5, 1873.

23,320.—*Apparatus for Skimming the Surface of the Water in Steam-Boilers.*—Granted to A. M. SPRAGUE, March 22, 1859. Hearing March 5, 1873.

23,344.—*Mode of Fastening Skates.*—Granted to EDWARD BEHR, March 29, 1859. Hearing March 12, 1873.

23,361.—*Machines for Pegging Boots and Shoes.*—Granted to ALPHEUS C. GALLAHUE, March 29, 1859; reissued June 22, 1869. Hearing March 12, 1873.

23,364.—*Tools for Cutting Metal.*—Granted to L. F. GOODYEAR, March 29, 1859. Hearing March 12, 1873.

23,396.—*Stoves.*—Granted to HENRY R. ROBBINS, March 29, 1859. Hearing March 12, 1873.

23,399.—*Harvesters.*—Granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859. Hearing March 12, 1873.

23,416.—*Sausage-Stuffers.*—Granted to JOHN WAGNER, March 29, 1859. Hearing March 12, 1873.

23,425.—*Machine for Rolling Iron.*—Granted to HENRY B. COMER, March 29, 1859. Hearing March 12, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859. Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 29, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTUCK, April 19, 1859; reissued April 17, 1866, again in three divisions, Nos. 4,894, 4,895, and 4,896, March 26, 1872. Hearing April 2, 1873.

23,716.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,631 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,735.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,736.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 2, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,980, 1,981, 1,982, and 1,983, June 6, 1865; No. 1,980 having been ordered to again reissue, No. 5,250, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERSHON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,860.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,029.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS R. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.*—Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sawing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,169.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 21, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABATON, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMENT, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

8,589.—*Improvement in Machines for Making Kettles*, granted to HIRAM W. HAYDEN, December 16, 1851; extended seven years; reissued February 13, 1866, numbered 2,171; reissued May 24, 1870, numbered 3,995; extended by act of Congress, approved March 3, 1873.—Division A.

Claim.—1. The application of a rotary metallic form or mold, or successive forms or molds, in combination with a proper tool or tools, roller or rollers, sustained, moved, and directed, in a proper path, by competent mechanical means, for the purpose of operating on a disk, blank, or plate of metal, so as to reduce it gradually

from the center to the edge, at the same time forming it with straight sides, by successive stages, into a complete kettle, or into any similar articles to the forming of which this apparatus can be applied, substantially as described and shown.

2. The construction of the mandrel f^3, part of which is cylindrical and part fitted with a short screw, 13, to take the screw of the hand-wheel f^4, so that great pressure may be made at the point desired, while, at the same time, the mandrel can be easily and quickly moved through a long distance, for the purposes, and as described and shown.

8,589.—*Improvement in Brass Kettles*, granted to HIRAM W. HAYDEN, December 16, 1851; extended seven years; reissued February 13, 1866, numbered 2,171; reissued May 24, 1870, numbered 3,996; extended by act of Congress, approved March 3, 1873.—Division B.

Claim.—1. A kettle or other similar metallic article or vessel made from a single sheet or flat disk or blank of metal, stretched and compressed so as to extend the sheet into its ultimate form, by the process, substantially as herein set forth.

2. A kettle, or other similar metallic article or vessel, having its greatest thickness at the bottom, and thinned or gradually reduced in thickness toward the top by the process, substantially as set forth.

23,320.—*Improved Apparatus for Skimming the Surface of the Water in Steam-Boilers*, granted to A. M. STRAGUE, March 22, 1859. (CHARLOTTE SPRAGUE, administratrix.)

Claim.—The surface-skimmer B, constructed, arranged, and operating substantially as and for the purpose of removing the sedimentary water from the upper water surface of steam-boilers.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 11, 1873.]

6,490.—*Lamp-Stand.*—DAVID MOSMAN, West Meriden, Conn.

6,491.—*Work-Holder.*—RUSSELL W. PERKINS, West Meriden, assignor to himself and JAMES H. HOLMES, Wallingford, Conn.

6,492.—*Lounge.*—JOHN B. ROHRER, Philadelphia, Pa., assignor to SAMUEL COOPER and JOHN HALL, same place.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date March 11, 1873.]

1,160.—*Soap.*—JOSEPH S. & THOMAS ELKINTON, Philadelphia, Pa.

1,161.—*Linen and Muslin Shirts.*—T. J. IRVING & Co., Baltimore, Md.

1,162.—*Rubber Hose and Belting.*—NATIONAL RUBBER COMPANY, Bristol, R. I.

1,163.—*Printed Publications.*—F. and J. RIVES and GEORGE A. BAILEY, Washington, D. C.

1,164.—*Boots and Shoes.*—THOMAS W. SEAVERNS, Jr., West Roxbury, Mass.

1,165.—*Meizola, a Product of Corn.*—WARDER & COOPER, Valley Junction, Ohio.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date March 11, 1873.]

ORIGINAL PATENTS.

136,578.—*Dumping-Scow.*—JOSEPH E. BARTLETT, Boston, Mass.

The discharge-gates are free to swing out farther than to a perpendicular position when fully open, so as to allow the contents to spread out and discharge itself evenly, and on less depth of water than usual.

Claim.—A mud-scow with air-chambers *f f* on each side of the mud-room *a*, and having its gate-space *d* made wider at the bottom than at the top, in combination with doors *b b*, not projecting below the bottom of the scow, for the purpose of allowing the mud to spread out and discharge itself to a level as soon as the doors *b b* are opened, as herein set forth.

136,579.—*Lathe Rest.*—CHARLES A. BAUER, Hamilton, Ohio.

The ordinary flange on the bottom of the tool-post has situated between it and the ledges above, a square washer in which is an annular groove. The flange fits in the groove and forms a wide bearing for steadying the post when the tool is clamped in the same. The square washer can be moved along with the tool laterally.

Claim.—In combination with the tool-post B *b* and grooved rest A G *g* of a lathe, I claim the loose ring or washer H, constructed and operating substantially as and for the purpose specified.

136,580.—*Elevator.*—JAMES M. BEAN, Watertown, Mass.

Two endless chains running upon grooved wheels, and carrying a series of revolving platforms and intervening seats for passengers for the various landings of a building.

Claim.—1. A revolving platform, as C, constructed and arranged upon a rod or hinge, as I, in combination with the endless chains, as E E, and stays, as G G, &c., substantially as and for the purpose described.

2. A revolving seat, as D, constructed and arranged upon a rod or hinge, as I, in combination with the endless chains, as E E, stays, as G G, &c., substantially as and for the purposes described.

3. The hooks H H, &c., as combined and arranged with the chain-links F F, &c., and for the purposes substantially as described.

4. The rollers M M, &c., combined and in arrangement with the endless chains E E, the stays G G, &c., the guides L L, and the hooks H H, &c., substantially as and for the purposes described.

5. A passenger-elevator provided with a series of revolving and self-adjusting platforms, as C C, &c., and a series of revolving and self-adjusting seats, as D D, &c., in combination and arranged with an endless belt whose edges run in continuous grooves, as K K, or other suitable guides, said belt being composed of chains, as E E, stays, as G G, &c., and operated by two or more sprocket-wheels, as B B, substantially as described.

6. Operating two or more gates or doors, as N N, &c., by one movement, the same being operated by pulleys, as R R P P, &c., cords, as X X X' X' Z Z Z' Z', rollers, as S S, lever, as T, the whole being combined and arranged substantially as and for the purposes described.

136,581.—*Car-Brake.*—WILLIAM HAND BROWNE and WILLIAM M. PEGRAM, Baltimore, Md.

A cam or snail is attached to the brake-rod, by means of which the slack-chain of the brakes is quickly taken up.

Claim.—The use, upon a car-brake shaft or rod, or its equivalent, of a disk of any required dimensions, having a snail, or helix, or cam, as described, substantially as and for the purpose set forth.

136,582.—*Foot-Warming Attachment for Sewing-Machine Treadles.*—ANNIE R. BUSS, Chicago, Ill.

The treadle has a chamber provided with a hinged cover. A warming-iron fits into this chamber.

Claim.—A hollow or box treadle for sewing-machines, provided with a receptacle for a heated iron, substantially as and for the purpose set forth.

136,583.—*Construction of Houses.*—OLIVER C. CAMPBELL, Omaha, Neb.

The facing-tiles are formed with a dovetailed recess for the reception of the prismoidal attaching block. The beveled flange overlaps on two sides, thus covering both the joint and the attaching block. An appearance of cut stone is given to a wooden house.

Claim.—1. The block or tile A for facing the walls of buildings, formed with the beveled covering-flange *c* and the dovetailed recess *a* for the purpose of attachment, all substantially as shown and described.

2. The prismoidal block B and screw *b*, in combination with the tile A having the dovetailed recess *a*, substantially as specified.

136,584.—*Milk-Cooler.*—WARREN O. CAMPBELL, Montgomery Centre, Vt.

The milk-pan is constructed with a movable partition, and it is arranged in a suitable frame with a water-reservoir below which may be raised, by means of suitable mechanism, so that the same may be brought up against the bottom of the milk-pan when it is desired to cool the milk.

Claim.—1. The milk pan A, provided with one or more movable transverse partitions, *a*, and one or more tubes, *b*, each tube having washers *d* and *e*, all substantially as and for the purposes herein set forth.

2. The combination of the movable frame D, bars E E, levers G G, cords or chains *p p*, roller *s*, and wheel H, all arranged in the main frame C, and used with the pan A and cooler B, substantially as and for the purposes herein set forth.

136,585.—*Machine for Re-rolling Metallic Bands.*—CHARLES WALLACE CHAPMAN, Liverpool, England.

The strips of metal are fed to the rolls between guides, which can be adjusted to suit any width of strip, and in the rear of the rolls is a receiving table. Under the ordinary screws that raise and lower the boxes of the rolls are placed elastic buffers, which cause the upper roll to conform to any inequality in the metal.

Claim.—The machine herein described, consisting of the steering or directing guide *k*, the elastic buffer *d*, and delivery-table *e*, combined with the horizontal rollers *b* and *b'* and frame *a a'* to roll and re-form the banding, substantially as described, for the purpose specified.

136,586.—*Lamp-Burner.*—BENJAMIN F. CHAPPELL, Hartford, Conn., assignor to himself and NORMAN SMITH, same place.

Opposite the ratchet-spindle is secured a tube having an enlarged hollow head, a portion of which is cut away. In this tube moves a rod having on its head a narrow projection, and on its inner end a clutch adapted to engage with the clutch on the end of the ratchet-spindle. The two clutches being engaged, the motion of the spur-wheel is limited; when out of gear the wheel is free.

Claim.—1. The mechanism, constructed substantially in the manner described, which, when clutched with the ordinary spindle for operating the wick, limits its motion, and when unclutched allows it to move freely, as herein specified.

2. The devices *f g A i j k*, for regulating the motion of the wick, substantially in the manner described.

3. The combination of the regulating mechanism for limiting the motion of the wick with the ordinary spindle and spur-wheel for operating a lamp-wick, substantially as herein specified.

136,587.—*Hat and Parcel Holder.*—ALFRED CLARKE, Philadelphia, Pa.

The free ends of the straps are provided with hooks, so that after the straps are brought around a parcel the hooks may be locked together to hold it securely; or the hooks may be used for holding the article and suspending it.

Claim.—1. The spring-clasp A, made of a single strip of metal, bent into a circular form, and provided with a hook, D, substantially in the manner and for the purpose above described.

2. The combination of the elastic straps E E with the spring-clasp A, the straps having hooks *b b*, substantially as and for the purpose set forth.

136,588.—*Vessel for Steaming Oysters.*—CHARLES S. COLLINS, Baltimore, Md., assignor of one-half his right to JOHN T. FLEEHEARTY, same place.

A greater perforated surface is given to the vessel wherein the articles to be steamed are placed, and it is so arranged as to be kept steadily in proper position.

Claim.—In combination with the cylindrical perforated dish B supported within the steamer, as described, the flange *b*, bracing-pieces *c*, and handles *d'*, substantially as herein set forth.

136,589.—*Stove-Platform.*—WALTER M. CONGER, Newark, N. J.

Under the central dome a shield (or two) is suitably supported on lugs, or by a screw-bolt passing through the center.

Claim.—The continuous sheet A *a* formed with a dome where the heat is received, in combination with the shield or shields B held between the dome and floor, with a space above and below, and adapted to serve as herein set forth.

136,590.—*Pencil-Sharpener.*—EDWARD M. CRANDALL, Chicago, Ill.

The end of the pencil, being introduced into the socket and turned, is acted upon simultaneously by all the teeth of the different file-blades. The particles removed escape through the openings.

Claim.—The herein-described device for sharpening slate-pencils, consisting of the conical body A having the file-blades B and the openings C, constructed and arranged to operate as herein set forth.

136,591.—*Slate.*—CHARLES DRASSER, Chicago, Ill.

Claim.—1. The metallic plate P, covered with any suitable composition to form a penciling-surface, and provided with a hollow frame, A, as set forth.

2. The combination of the plate P, coated as set forth, and provided with a hollow frame, A, and pencil-receptacle, substantially as set forth.

136,592.—*Process for Making Coke from Lignites.*—HENRY ENGELMAN, Salt Lake City, Utah Ter.

To the lignite add coal-tar, bitumen, or analogous substances, and subject to an initial heat above a "cherry-red," laterally applied, so as to volatilize and decompose the hydrocarbons and to cement the particles or fragments of lignite, producing a compact coke.

Claim.—1. The process of coking brown coal, lignite, and analogous coal-like material incapable of effective coking by the usual practice with ordinary coking-ovens by mingling the same with coal-tar, asphaltum, or analogous substances, or with bituminous coking coal, or with coal-tar and coking coal together, and subjecting the whole to an initial and sustained heat above a "cherry-red," so termed, and applied laterally throughout the mass, substantially as herein set forth.

2. The process herein described of solidifying by pressure the coked product formed by mingling coal tar or equivalent material and subjecting the same to a heat above a cherry-red, for the purpose specified.

136,593.—*Ice-Tongs.*—WILLIAM THEODAR FARRE, Montreal, Canada.

A handle provided with two hooks pivoted near its ends, and arranged so as to cross each other in such a manner as to increase their gripe.

Claim.—The ice-tongs consisting of the handle A and hooks B B, substantially as described and shown.

136,594.—*Link for Ornamental Chains.*—JOSEPH J. FREEMAN, Attleborough, Mass., assignor to FREEMAN & CO., same place.

A chain-link, formed of wire, bent around a suitable form and then having the ends turned inwardly, forming two loops and an eye, by which any desired number of such links may be readily grouped into a chain for jewelry.

Claim.—The chain-link A, formed of wire, bent around as shown, and having its ends turned inwardly so as to form the two loops *a a* and the eye *a'*, substantially as described.

136,595.—*Mechanism for Heading Barrels.*—JAMES GRIFFING, Ipswich, Mass., assignor to himself and BENJAMIN H. SMITH, same place.

By pressing the lever downward the barrel head is forced down to the crease of the staves. The cooper next puts one foot through the stirrup and holds the parts in position, or he effects such by driving the spur into the head of the barrel.

Claim.—The lever A, the bearer B, the hooked arm C, the hanger D, and the spur E or the stirrup F, or both, all combined and arranged together substantially as and for use as specified.

136,596.—*Stew-Pan.*—GEORGE W. GRISWOLD, Factoryville, Pa.

The pan being permanently attached to the cylindrical vessel, a continuous circulation of water is kept up through the passages.

Claim.—In combination with a stew-pan or culinary vessel composed of an inner and outer jacket or vessel with water or steam space between them, and with a lip, the upper and under openings *c d* extending from such lip into the water and steam chamber, for the several purposes of filling and emptying said chamber, allowing the steam to escape into said lip, and its water of condensation to flow back into said chamber through the lower opening, permitting circulation of the water, greater uniformity of temperature, and more rapid heat, as described and represented.

136,597.—*Drip-Collecting Device.*—WILLIAM A. HARRIS, Providence, R. I.

Claim.—The combination of the pedestal or standard C, constructed with lip A, to serve as a drip collector and conductor, as described, with tubes *a* and drip-box B, or other receptacle for the drippings, as specified.

136,598.—*Knife-Scourer.*—EZRA W. HAVEN, Brandon, Vt.

In the shallow pan an inclined bar, with the ends bent at right angles, is permanently fixed. It is supported in the middle by an upright piece.

Claim.—The arrangement and combination of the disk D, bar B, and support *a*, substantially as and for the purposes set forth.

136,599.—*Garter.*—HENRY A. HOUSE, Bridgeport, Conn.

Two metallic bands pass through a flat helical spring, and have their inner ends secured to opposite ends of the spring, so that when their outer ends are drawn outward the spring is contracted.

Claim.—1. The garter-spring A, having its ends connected to internal strips B B, substantially as described.

2. The strips B B, perforated as described, and having T-shaped fastenings *b* on one or both ends, in combination with the spring A, substantially as described.

136,600.—*Water and Beer Cooler.*—CHARLES HUBBIG, Philadelphia, Pa.

When liquid is drawn from the cask, which is connected with the cold-air pipe of the water-cooler, the cold air immediately passes through said pipe to supply its place, and thereby cools the liquid within the cask.

Claim.—1. The water-cooler A, so constructed that, by the withdrawal of beer or other liquid from a separate receptacle communicating therewith, air entering the cooler will permit cold air in the cooler to pass into the said receptacle, substantially in the manner and for the purpose set forth.

2. The water-cooler A, cold-air exit 5, overflow 4, and partition or perforated ice-supporter *a'*, combined and operating substantially as described.

136,601.—*Compound Implement.*—ANTHONY ISKE, Lancaster, Pa.

Claim.—A compound implement consisting of a hand corn-sheller, boot-jack, hammer, and its appendages, formed by the combination of the parts A B C and pivot D, all constructed substantially in the manner and for the purposes specified and shown.

136,602.—*Cloth-Cutting Machine.*—JOHN KENT, New York, N. Y.

To regulate the length of material cut off at each stroke of the knife a graduated sliding wedge or abutment is so arranged as to determine the movement of the pawl-lever of the take-up mechanism; and to adapt the stroke of the knife to the quality of the material the connection with the actuating-crank is made adjustable.

Claim.—1. The combination of the adjustable graduated abutment *g*, lever D, springs G and *h*, pawl F, ratchet wheel H, cam E and rollers I and I', as and for the purposes herein set forth.

2. The combination of the lever D, springs G and *h*, ratchet-wheel H, pawl F, cam E, and abutment *g*, with the knife M and crank P, substantially as herein shown and described, and for the purposes set forth.

136,603.—*Treadle.*—GEORGE B. KIRKHAM, New York, N. Y.

Foot-power to turn a fly-wheel constantly in the same direction, with noiseless and positive motion. The fly-wheel kept in motion by the alternate pressure of two bearing arms, one above and one below. The bearing-arms attached to a pitman, operated in turn by the treadle. The pitman steadied by friction-clutches hinged to the treadle, which act as a shifting apparatus, and, by pressure against the pitman, increase the traction of the bearing-arms against the fly-wheel. Applicable to sewing-machines, jig-saws, hand-lathes, and the like.

Claim.—1. The arrangement of the bearing-arms B B' with the pitman C and the set-screws *a a*, substantially as and for the purpose hereinbefore set forth.

2. The combination of friction clutches F F G and H I J K with the pitman and treadle, substantially as and for the purpose hereinbefore set forth.

3. The arrangement of the curved arms B B', set-screws *b b* and double pitman C C', substantially as and for the purpose hereinbefore set forth.

4. The arrangement of the two halves of the wheel A A', disks *c c*, screws *d d*, with grooves, bevels, curved or flat surfaces to the arms B B' and wheel A A', substantially as and for the purpose hereinbefore set forth.

136,604.—*Artificial Stone.*—RICHARD LEMARE, New York, N. Y.

Claim.—A composition of the above-mentioned materials, to wit, hydraulic cement and gas-retort breeze or dust.

136,605.—*Brush-Ferrule.*—WILLIAM F. LOREY, Mendon, N. Y.

The ferrule has an opening in the top for the handle. The sides are in two parts, the edges lapping each other, and have a flaring band to slip over them.

Claim.—The metallic cup-ferrule B with two or more slip-joints *a a*, in combination with the metal band C, as and for the purposes herein described and specified.

136,606.—*Combination Lock.*—WILLIAM C. MCGILL, Cincinnati, Ohio.

The outer ends of the tubes or sleeves are provided with hands or pointers, and the inner ends with cranks or disks having pins, which, when properly adjusted, enter corresponding holes in the gear-disk which operates the bolt.

Claim.—The arrangement of the shaft C with the tubes or sleeves D and E, provided with their respective pins c^1, d^2, and e^3, in combination with gear-disk G, as and for the purpose herein described.

136,607.—*Baby-Carriage.*—SAMUEL MCINTIRE, Brooklyn, N. Y.

Claim.—1. The castings E, receiving and connecting the axle B, perch C, and spring *m*, as herein specified.

2. In combination with the body A and axles B, the spiral springs *m*, connected to castings above and below by screw-threads corresponding therewith, substantially as herein specified.

3. The bent supports *p*, in combination with the parasol T and two sockets, P, fixed in the opposite sides of the body A, as herein specified.

4. The casting R, connecting the shank *t* of the parasol with the side supports *p*, the connections being formed by screw-threads arranged to serve as herein specified.

136,608.—*Sediment-Drain.*—GEORGE R. MOORE, Lyons, Iowa.

The sediment receptacle and container is provided with a perforated top, and is placed above the bottom of the inlet-pipe so as to intercept any floating substances passing upward. Near the bottom of the receptacle is provided means for clearing out the same.

Claim.—1. The strainer C, or its equivalent, placed above the bottom of the inlet-pipe, substantially as and for the purpose herein set forth.

2. The arrangement of the several parts A, B, C, E, F, and G, as herein shown.

136,609.—*Ash-Screener and Commode.*—JAMES C. MORRELL, Manchester, England.

Within a box attached to the commode is arranged an ash-screen and cinder-sifter. By the depression of the seat or the movement of a handle motion is given to the screener and its attachments, by which the cinders are carried down the inclined screen and the ash-dust onto the inclined planes forming the hopper below, and thence into the measure. Upon the seat being released the screener and hopper resume their original position, and in the act of doing so a notch upon the hopper-funnel sends before it the dust collected in the trough and distributes it.

Claim.—1. The ash screener *c* hung at rear of a closet for receiving motion, as described, the same with inclined planes forming hopper c^1 and funnel *f* and notch *h* attached thereto, as described.

2. The combination of the above with pent-house *a* and commode-seat *b*, forming a combined ash-screener and commode, substantially as hereinbefore described and set forth.

136,610.—*Car-Coupling.*—JOHN MOULTON, Moultonville, N. H., assignor to himself and WILLIAM P. B. BROOKS, Chelsea, Mass.

The jaws are opened by levers, which are pivoted at each side of the draw-head, and which are retained, when depressed, to hold the jaw up, by catches. The springs guide the link into the approaching draw-head.

Claim.—1. The combination and arrangement of the two levers D D with the chambered parts *a b*, hinged together, and provided with a closing-spring, as set forth.

2. The combination and arrangement of the two catches E E with the levers D D and the chambered parts *a b*, hinged together, and provided with a closing-spring, as explained.

3. The combination and arrangement of the series *o o* of springs with the parts *a b*, chambered, hinged together, and provided with the closing-spring, substantially as explained.

4. The draw-bar as constructed of the two parts *a b*, hinged and provided with the closing-spring, and chambered, and furnished with a conical mouth to such chamber and with the set of levers D D, and as having the link-pin hole *m'* arranged in such parts *a b* and with respect to the mouth *e* of the chamber, all substantially as shown and described.

136,611.—*Bird-Cage.*—GEORGE J. MUNSCHAUER, Buffalo, N. Y.

The detachable bottom is provided with a sliding self-locking device, which prevents the catch from becoming accidentally unclasped and detached.

Claim.—The plate E formed with the end *c c'* for attachment to the clasp D, and with the point *d* for working between the wires *e e'* of the clasp, as set forth, the several parts operating in respect to each other and to the cage A and the bottom B, as herein shown and described.

136,612.—*Sad-Iron.*—FREDERICK MYERS, New York, N. Y.

A sad-iron of the common form has a vertical standard at the front end. To this a long handle is riveted. At the heel of the sad-iron are two legs, which extend far enough to meet the length of the prolonged handle, so that the iron can rest upon them when raised from the flat surface.

Claim.—The combination of the sad-iron A, standard B, handle D, and legs E, the handle being extended to form a leg, substantially as specified.

136,613.—*Sad and Embossing Iron Combined.*—FREDERICK MYERS, New York, N. Y.

In a sad-iron constructed of a lower polishing-plate and an upper detachable handle-plate, embossing-surfaces are arranged on the inner faces of the upper and lower plates, respectively.

Claim.—The combination of the base-plate A, handle-plate B, embossing-surface L of plate A, and embossing-surface M of plate B, the said plates being pivoted together as at G, and provided with locking devices F H, substantially as specified.

136,614.—*Reed-Organ.*—EDWARD OAKES, Danville, Ill.

The reed-board is suspended upon wires and connected with the wind-chest by flexible tubing for alleged freedom of vibration. The flexible tubes contain springs to prevent collapse, and the reed-blocks are made angle-shaped to carry two reeds to each block.

Claim.—1. The vibrating reed-case D, separate and apart from the keys and the body of the instrument, and suspended by means of cords or wires and springs, substantially as specified.

2. The adjustable springs *f f f f*, in combination with the wires *e e e e* and the vibrating reed-case D, substantially as specified.

3. The flexible tubes I I, with the ribs *i i*, or with a spiral spring, i^2, as described, and in combination with the nipples J J, substantially as specified, and for the purpose set forth.

4. The combination of the swell-box B and cover C, said cover operated with the toggle-lever *c*, lever c^1, and rod c^2, or other equivalent devices, with the vibrating reed-case D, substantially as described, and for the purpose set forth.

5. The arched reed-block K, as shown in Fig. 3, substantially as described, and for the purpose set forth.

136,615.—*Cigar-Mold.*—CHARLES H. PALMER, New York, N. Y.

The two hollow jaws of the mold are hinged together at one end, and at the other end have clasps fitting into each other, and at the sides logs for guiding the jaws while shutting and for holding them in place.

Claim.—A sheet-metal mold for drying cigars, consisting of two hollow jaws hinged together at one end, and provided with male and female clasps at their tips, and lips at their sides for guiding and holding the jaws in place, as set forth.

136,616.—*Sewing-Machine.*—WILLIAM C. PICKERSGILL, Providence, R. I., assignor to PROVIDENCE TOOL COMPANY, same place.

The feeding device is moved horizontally through the rocking-shaft, on which is the "presser arm," and which is adjustable with reference to the inclined vibrating cam-face to vary the length of feeding movement. The feed is raised by the vibrating cam or toe on the shaft that carries the vibrating shuttle-lever actuating bell-crank.

Claim.—1. The combination of devices for giving to the shuttle-lever a horizontally vibrating movement, and also for giving vertical movement to the feed-bar, the same consisting of the eccentric on the main shaft, its pitman or link D, and the vertically-vibrating bell-crank lever, connected with the shuttle-lever by means of a spheroidal tip embraced within a bifurcation, and operating a toe-cam below and adjacent to the feed-bar, substantially as described.

2. The combination of the vibrating cam-face I, adjustable presser-arm K, rocker shaft L, and feed-bar O, substantially as described.

3. The combination, with the feed-bar, of the vibrating toe T, the vibrating cam-face I, both of which are respectively operated by the eccentrics B and C, and the presser-arm K, made adjustable with relation to the cam-face, substantially as and for the purposes specified.

136,617.—*Hydraulic Railway Brake.*—GEORGE PEARSON RENSHAW, Park Valley, England.

By means of water admitted to cylinders or chambers with flexible diaphragms the brakes are actuated and set against the wheels. Raises the water so applied by fans or arms secured upon the axles, whereby the water, after having actuated the brakes, can be returned to the reservoir. Also arranges suitable valves which operate the brakes, so that by means of cords or other flexible connections they shall be under the control of the engineer.

Claim.—1. The chambers E provided with the disks G and diaphragms *d*, operated by the pressure of a head of water through the medium of the cistern A and pipe F, in combination with the brake-block I, substantially as herein shown and described.

2. The fans Q clamped on the axle O, and operating within the casing N by the motion of the carriage, in combination with the inclined aprons R R, cistern A, receiver C, and pipe D, substantially as and for the purposes set forth.

3. The combination of the cords *g*, spring or weight *f*, and valves K and L with the chambers E and brake-block I, all being arranged and operated substantially as and for the purposes herein set forth.

136,618.—*Relief-Valve for Locomotives.*—GEORGE W. RICHARDSON, Troy, N. Y.

Provides the valves with spiral wings to keep the seat from wearing uneven; also heats the air before entering the cylinder to prevent condensation.

Claim.—1. A relief-valve constructed with spiral wings in the bush or seat or on the valve-stem, substantially as and for the purpose hereinbefore set forth.

2. The combination of a relief-valve with the steam-pipe, or with the dry-pipe and steam-pipe of a locomotive, substantially as and for the purpose hereinbefore set forth.

3. A relief-valve connected to the steam-chest or cylinder of a locomotive-engine by a pipe, arranged substantially as described, so that atmospheric air introduced therein by means of said relief-valve may be heated while passing through said pipe before entering the steam-chest or cylinder, for the purpose hereinbefore set forth.

136,619.—*Exhaust-Nozzle for Locomotives.*—GEORGE W. RICHARDSON, Troy, N. Y.

Arranges small tips inside of the common exhaust-nozzles to prevent cinders from falling back into nozzles.

Claim.—The tip or tips of a blower-pipe within the exhaust pipe or pipes of a locomotive-engine, substantially as and for the purpose hereinbefore set forth.

136,620.—*Machine for Rolling Carriage-Axles.*—JULIUS C. RICHARDSON, New Haven, Conn.

The walls of the grooves, at the parting of the rolls, are chamfered, in order that the fins, which are inevitable, may, by being greatly thickened, be the more readily rolled back into the bar at the next pass. The ends of the rolls are plain, but possess, nevertheless, the same varied eccentricities as the grooves.

Claim.—1. The upper roll made with two diameters, one smaller than the other, such roll presenting a concentric-grooved rolling surface, *d'*, and a plain concentric surface, *d*, and also having shoulders *g g*, in combination with the lower roller D', which has an eccentric-grooved rolling-surface and a shoulder, g^2, the groove *a a'* commencing at the highest point of the shoulder and terminating at the base of the same, substantially in the manner and for the purpose described.

2. Elongated or beveled grooves *r' r'* formed in the rolls, for the purpose of forming fins *e' e'* on the bars and rolling down these fins, substantially as described.

136,621.—*Machine for Tapping Pipe Fittings.*—ETHAN ROGERS, Cleveland, Ohio.

An intermittingly-revolving wheel, provided with clamping-jaws, presents the fittings to the action of a double system of taps, geared together. The taps are fed forward by screws attached to the ends of the mandrel, working in stationary nuts. The motion of the taps is automatically reversed by means of two pulleys and clutches, revolving in opposite directions, alternately connected by a centrally-pivoted lever, oscillated by adjustable collars on a screw, fed to and fro by a revolving nut.

Claim.—1. The upper system of taps D E F and the lower system G H I, as arranged to co-operate in relation to each other and in combination with the clamp-wheel I'', substantially in the manner and for the purpose set forth.

2. The screw F' and lever D', in combination with the clutch U and pulley V and clutch X and pulley W, substantially in the manner as and for the purpose specified.

3. The spring Q', arm M', and roller O', as arranged in combination with the lever D', in the manner as and for the purpose set forth.

4. The adjusting-collars L', as arranged in combination with the screw F' and lever D', for the purpose specified.

5. The slide R', as arranged in combination with the lever D', wheel T', and clamp-wheel I'', substantially in the manner as and for the purpose set forth.

6. The shaft B'', clutch A'', collar *m*, spring Y, slide R', lug *n*, and pinion V', as arranged to operate in combination with the wheel T' and clamp-wheel I'', in the manner as and for the purpose set forth.

7. The spring D'', shoulder *a*, pawl H'', and arm E'', as arranged to operate in combination with the clutch A'' and shaft B'', substantially in the manner as and for the purpose set forth.

8. The clamping-wheel I'', consisting of the series of rigid jaws J'' and movable jaws K'', and operated in relation thereto by means of the links L'', cams *c*, handles M'', and trip O'', substantially in the manner as described, and for the purpose specified.

9. The bolt *f*, sleeve *g*, and jam-nuts *h*, as arranged in combination with the movable jaw K'' and box *d*, in the manner as and for the purpose set forth.

136,622.—*Rotary Balanced Cut-Off Valve.*—PATER SHELLENBACK and FERDINAND EHLMAYER, Hamilton, Ohio.

A hollow rotary balanced cut-off valve having suitable induction and eduction ports is arranged longitudinally with the cylinder, and is operated by bevel-wheels, one keyed on the end of the valve-stem and the other on the crank-shaft of the engine. By a hand-wheel on the valve-stem the engine is reversed.

Claim.—The hollow rotary balanced cut-off valve *d* having induct-ports *y y* and exhaust ports *z z*, in combination with valve-shaft 10, bevel-wheels *f f*, and hand-wheel 8, all constructed and arranged for operation, substantially as and for the purposes set forth.

136,623.—*Preparing Camphor.*—WILLIAM F. SIMES, Philadelphia, Pa.

For preserving furs, medicinal uses, &c.

Claim.—As a new article of manufacture, cakes, blocks, or tablets of distilled or refined camphor, formed by pressure, for medicinal and other uses as set forth.

136,624.—*Meat-Chopping Machine.*—GEORGE SPIEHLMAN, Strasburg, Pa.

A series of coiled springs are hinged to the top of the shafts which carry the cutting-blades, and are adjusted as to tension by a cross-bar, lever, and curved rack, the cutting-blades and shafts being operated by curved lifters arranged spirally on a power-shaft, which also carries an eccentric feeding device. On the revolving chopping-block and cylinder is arranged an inclined plane, which operates a bell mechanism for timing the revolutions.

Claim.—1. The coiled springs P, made adjustable by the cross-bar Q, lever R, and curved rack S, and catch A, in combination with the cross-heads *p*, hinged to the top of the vertical shafts of the cutting-blades or choppers U, arranged and operating substantially in the manner and for the purpose specified.

2. The attachment of the bell *r*, hammer *z*, and appliances, when actuated by means of an inclined plane on the upper and outer portion of the rim or cylinder C on the revolving block B, arranged substantially in the manner and for the purpose mentioned.

136,625.—*Car-Chock for Railroad Rails.*—WILLIAM O. STEPHENSON, Marion county, Ind., assignor to himself, HENRY C. LORD, and DILLARD RICKETS.

The device is clamped upon a railroad rail to prevent cars from being blown or maliciously run off the siding.

Claim.—A chock for rails composed of hinged jaws A A' *a* B and locking-pin C *c c'*, connected and operating substantially in the manner and for the purpose specified.

136,626.—*Tension-Indicator for Sewing-Machines.*—DAVID B. TIFFANY, Xenia, Ohio.

The normal position of the spring is at that end of the graduated slot furthest from the ratchet teeth. The knotted end of the thread is slipped into one of the notches in the end of the spring, and when moving the frame away from the spool the spring will move a certain distance before the spool will turn on its support, and the mark on the frame opposite the spring, when the spool turns, designates its tension. The tension required may, by the usual nuts, &c., and this device, be adjusted to any required degree.

Claim.—The combination of the frame A, constructed as described, with slot *b* and teeth *i i*, the spring C and pawl D, all substantially as and for the purpose herein set forth.

136,627.—*Car-Coupler.*—WAYLAND D. TISDALE, Cortland, N. Y., assignor to himself and CHESTER BABCOCK, same place.

A bail for lifting and guiding the link turning in ears depending from the buffers. This bail is capable of being drawn toward either side of the car, and is held in the center by springs coiled around it and bearing against the ears.

Claim.—The combination of the rod *b* when bent as described, and having the loop or projection *a* thereon, with the coiled springs *c c* and eyes *d d*, substantially as and for the purposes set forth.

136,628.—*Harvester.*—JOHN S. TRUXELL, Greensburg, Pa.

The finger bar is connected to the main frame by jointed bars, which admit of a ready removal of the cutting apparatus and its transfer from front to rear for the purpose of admitting the machine to be used either as a front or rear cut.

Claim.—The jointed bars A combined with a harvester-frame and cutter-bar in the manner described, so as to allow the cutter-bar to be placed either at the front or rear end of the frame.

136,629.—*Door for Refrigerators.*—PETER A. VOOT, Buffalo, N. Y.

A strip of India rubber is arranged between the main portion of the door and the metallic lining of the same in such a manner as to form a packing for the door when the same is closed.

Claim.—In combination with a refrigerator-door, the rubber packing-tongue C, arranged between the door and its lining in the manner described, so that the closing of the door will cause the tongue to turn at the hinge-side in a reverse direction to that taken at the other three sides, thus relieving the hinges from unnecessary strain.

136,630.—*Portable Fence.*—DAVID S. WATTS, Canton, Miss.

Uprights and braces meet and are secured by a cap. They are let into the ground-sill, as shown, forming a portable fence-post.

Claim.—The portable fence-post herein described, wherein the uprights B and diagonal braces D abut against and are secured to and covered by the cap-sill C, the whole being founded on the ground-sill A, provided with the mortises *a* and recesses *d d*, constructed, arranged, and operating in the manner substantially as set forth.

136,631.—*Steam-Power-Brake Coupling.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.

Each half of the coupling has a nozzle and socket at its inner end to fit on and in a corresponding socket and nozzle of the next coupling, so that the half coupling on either end of either car will couple onto any other half-coupling on the train. Spring-hooks and hand-levers are used on the coupling to hold the two halves together, and are duplicated in each half and arranged opposite each other in each half of the coupling.

Claim.—1. A pipe-coupling for air, steam, or other fluid brakes, in which each half is supplied with, first, a male and female part; second, a spring-hook, *m*, on one side of the outer face to engage a catch on the corresponding side of the other half; and third, a catch, *n*, opposite the spring-hook, on which to engage the spring-hook of the other half, substantially as set forth.

2. In combination with the male and female parts of a coupling, the metallic spring *t* and packing-ring *s* arranged with reference to securing an air-tight joint between the contiguous walls of the two, substantially as set forth.

136,632.—*Cooler for Wine.*—JOSEPH REED WHIPPLE, Boston, Mass.

The bottle is supported and held in a tub of ice and rapidly rotated.

Claim.—1. The combination and arrangement of the tub A A, the slab F, the shaft Q, and the devices for its rotation and securing the bottle to it, with the holder-shaft U, all substantially as described.

2. The combination and arrangement, with the above-named

devices, of the holder-shaft collar N with its set-screw P, the spikes T T or their equivalent, whether with or without the cone S², all substantially as described.

2. The combination and arrangement of the devices mentioned in the first claim with the standard-shaft D and the standard-projection C, all substantially as described.

136,633.—*Combined Carpet-Rag Looper, Button-Hole Cutter, and Press-Board.*—SETH M. WHITTEN, Algansee, Mich.

The looping-post may be turned down out of the way when not in use. The knife is adjustable for different sized button-holes, and it also may be turned down or removed when the board alone is to be used.

Claim.—The combination of the press board, button hole cutter, and carpet-rag looper, having all the parts constructed as described.

136,634.—*Nickel-Plating.*—ISAAC ADAMS, JR., Boston, Mass.

Claim.—The electro-deposition of nickel, or the electro-plating with nickel, by means of a solution of either of the soluble salts of nickel, such solution being prepared and being used, substantially, free from the presence of potash, soda, lime, alumina, and nitric acid, or either of them, and free from acid and alkaline reaction, or from either.

136,635.—*Rotating Hook for Sewing-Machines.*—ANDREW AIRD and JOHN AIRD, Troy, N. Y.

The reciprocating hook carried by the rotating hook, projects through a slit in its rim, and is moved in the arc of a circle by means of the link having a roller projecting into a cam-groove in a plate behind the hook. The reciprocating hook holds the loop of needle-thread from the time it passes over the bobbin until the new loop is taken, and this hook enables the "brush check" to be dispensed with.

Claim.—1. The reciprocating hook B attached to and working in connection with the rotating hook A, for straightening and holding the loop, substantially as described.

2. The cam C, in connection with pin *d*, link *e*, and friction-roller *f*, for the purpose of imparting the requisite motion to reciprocating hook B, substantially as set forth.

3. The combination of the hook B, rotating hook A, cam C, pin *d*, link *e*, and friction-roller *f*, substantially as specified.

136,636.—*Water-Proof Purse Fabric.*—SULLIVAN H. ATKINS, Melrose, Mass.

Claim.—1. As a new article of manufacture, felt formed with a meshed fabric backing and teaseled, as described, or so made and covered on the back with India rubber or a water-proof coating, all being essentially as set forth.

2. Felt teaseled on one side and backed on the other by rubber or a water-proof backing, as explained.

136,637.—*Bag-Tie.*—JOHN BANNISH, Hempstead, and DANIEL N. RHODES, Baldwinsville, N. Y.

One end of the cord is passed through a hole in each of two parallel plates and wedged securely between said plates by a lever, which is pressed down over the cord and secured by a hook.

Claim.—A bag-tie, consisting of the plates A B, lever C, hook E, and a string, combined substantially as specified.

136,638.—*Window-Sash Ventilator.*—JOHN C. BATES, Cold Spring, N. Y.

The cross-bar of the window is provided with holes, and attached to this cross bar is a slide moving upon headed pins. Upon this slide is also an outer slide, the inner slide having holes extending up through its upper edge in the form of transverse slots, and the outer slide provided with holes corresponding to those in the sash-bar, so that the slides may be so adjusted to admit the air directly or indirectly to the room, or the inner slide may be adjusted to cover the holes in the sash-bar and exclude the air.

Claim.—The application to a cross-bar of the window-sash A, having holes *a'*, of the slides E F, relatively slotted as shown in Fig. 3 of drawing and described, to admit the air directly or indirectly, in the manner set forth.

136,639.—*Knit Fabrics and Method of Knitting them.*—DANA BECKFORD, New York, N. Y.

Work is set up on enough needles to extend from the center of the circular part to the edge of the vertical part. The segments are produced by narrowing from the center to the circumference by raising the needles without dropping the stitches. They are then all depressed and another segment knit, and so on. By raveling the unwidened part a circular mat, fringed all around, will be produced.

Claim.—1. The process herein described of knitting by machinery a flat circular mat.

2. The process herein described of knitting by machinery a flat, circular, or square piece or mat continuously with and integral with a portion to form with such piece the sides of a hat, sack, or bag.

3. The described machine-knitted mat or tidy, whether fringed or not, made as and by the process herein set forth.

4. The described machine-knitted hat, sack, or bag, made as and by the process herein set forth.

136,640.—*Device for Coupling Cars.*—LESTER L. BOND, Chicago, Ill.

Extensions to the fingers and thumb for manipulating the link in coupling.

Claim.—1. A device for grasping and holding coupling-links extending from the head or arm and manipulated by the fingers so as to enable the operator to stand at a safe distance from the cars, substantially as specified.

2. The combination of a thumb-extension, *a*, and one or more finger-extensions, *b* or *c*, with a glove or other device for connecting them together at the hand, substantially as described.

136,641.—*Clothes-Line Pole.*—CHARLES B. BROWN, New Rochelle, N. Y.

To an upright or pole is attached, near its top by side clamps or connections, an arm operated by a coiled spring. The upper ends of both the pole and clamp are provided with half-round notches on their opposite faces to receive the cord, and by the aid of the spring is firmly held for its support.

Claim.—An improved clothes-line pole, formed by the combination of the hinged arm B and coiled spring C with the upper part of the pole A, said parts being provided with half-round notches a^1 b^1 and bevels a^2 b^2, substantially as herein shown and described, and for the purpose set forth.

136,642.—*Bee-Hive.*—ALMUS M. BRUBAKER and BENJAMIN R. WITMER, Millersville, Pa.

An attached bee-box has two or more ports registering with like ports in the side of the hive, a transparent tube conducting from the hive at the upper port far into said box, the box having a glass cover.

Claim.—A detachable swarming-cage, W, when the same is provided with a glass tube, Q, and sliding glass top *t*, so as to be applied to a bee box or hive, adapted to communicate at two or more points with said cage W and tube Q, in the manner and for the purpose specified.

136,643.—*Grain Measure and Register.*—ROYAL B. CLARK, Lyle, Minn.

A revolving measure receives through a suitable opening its supply of grain from a hopper fitting closely to its circumference. When filled, it is revolved by a hand-lever and engaging-dog until the opening is at its lowest position, and the grain discharged, while an opposite similar chamber is being filled. A suitable register and index geared to the revolving measure indicates the quantity discharged through the apparatus.

Claim.—The combination, with a partitioned cylinder, D d^1 d^2, pivoted on shaft E and within a cylinder, A, of the pinion I gear-wheel J, shaft K, lever L, and spring-pawl M, arranged as and for the purpose described.

136,644.—*Loom-Temple.*—FRANK J. DUTCHER, Hopedale, Mass., assignor to DUTCHER TEMPLE COMPANY, same place.

Claim.—A toothed temple-roller provided with a wooden body and a horn or anti-friction cap or disk applied to its end, substantially as specified.

136,645.—*Toy-Puzzle.*—BENJAMIN F. ELLIS, Newton, Pa.

A wire ring jointed upon two sides is to be worked through swinging half hoops, one or more, each having a cross-bar top-piece, and back again.

Claim.—The combination of two or more bows and cross-bars and a ring, E, the bows and cross-bars having rings in the ends and connected together, as described, and the large ring E being made in two parts jointed together, substantially as specified.

136,646.—*Indicator and Low-Water Alarm for Boilers.*—MARK ELLWOOD, Girard, Ohio.

Upon the falling of the water the float, by means of a rack and segment, opens a valve and permits the steam through a side pipe to blow the whistle; at the same time through a rod connecting with said valve an index-hand is moved over a dial, denoting the height of the water.

Claim.—1. A water-indicator and low-water alarm, consisting of the float D, sector-lever G I, rack J with arms P and X, tube M, rod O, dial R, steam-pipe S, and whistle T, the apparatus being partly within and partly without the boiler, all constructed and arranged substantially as described.

2. The combination of the sector I, rack J, rod O, and the tube S, as and for the purposes described.

136,647.—*Colter.*—RALPH EMERSON, Rockford, Ill.

A revolving colter is swiveled to a reversible standard, thus giving more or less land to the furrow.

Claim.—1. The standard D, constructed as described, in combination with the yoke C, wheel B, and key *e*, substantially as and for the purpose herein specified.

2. The yoke *C*, constructed as described, and section *b*, forming the back, in combination with a standard, D, and wheel B, substantially as and for the purpose described.

136,648.—*Clasp-Button.*—ANDREW FLATLEY, Brooklyn, N. Y.

The clasp is made in two parts. One of the parts has a spring-catch which engages in the other part. Both parts are attachable to clothing and other articles by spiral fastenings.

Claim.—A clasp-button, A B C, provided with spiral-wire fasteners D upon the inner side of its two parts A B, to adapt it to be conveniently attached and detached, substantially as herein shown and described.

136,649.—*Shoe-Fastening.*—CHARLES GOLDTHWAIT, South Weymouth, Mass.

A tape or band is secured to the inside of one of the quarters, passed through a loop attached to the lining of the shoe at the heel, brought around the heel of the foot and across the instep, and is secured to the other quarter by a button or otherwise.

Claim.—The shoe as provided with the loop *a* at the heel, and with the band A fixed to one of the quarters and extended through the said loop *a*, as set forth, and having means of fastening it to the other quarter, whether such means be a button, B, and button-hole *c*, arranged with the band and quarter as explained, or any other suitable device or devices, all being essentially as and for the purpose or objects as specified.

136,650.—*Wrought-Iron Blind-Hinge.*—WILLIAM R. GOODRICH, Utica, N. Y.

The ordinary rising-and-falling lock-hinge for blinds is usually constructed of cast metal. The present invention makes the leaves and locking parts entirely of wrought metal, and rivets to one leaf a conical pintle. This hinge is, of course, much less liable to be broken in a high wind than the cast-iron one.

Claim.—A wrought-metal hinge, formed of parts C D, the former having the notch c^1 and the flange c^2, with hole c^3 and stop c^4 in rear, while the latter has the catch d^1 and the flange d^2, with conically-enlarged pintle d^3 riveted thereto, and a catch, d^4, as and for the purpose described.

136,651.—*Attachment for Sewing-Machines.*—JOHN M. GRIEST, Plainfield, Ind.

Designed for turning hems of different widths, and turning both edges of a strip of cloth to be used for trimming, sewing one edge on the cloth and turning and creasing the other at the same time, so that it may be easily sewn by hand or otherwise. The gage mentioned in the last clause bears on the fabric being trimmed, and forms a mark to designate the proper position for a new line of trimming.

Claim.—1. The scroll B, plates A, C, D, and E, and the adjustable scroll G, constructed and arranged and attached to the presser-foot, substantially as specified.

2. The combination, with the subject-matter of the foregoing claim, of the adjustable and detachable plates C', D', and E', substantially as specified.

3. The combination, with a hemming and trimming device, substantially as herein described, of a presser, Q R T, attached to the presser-foot, and relatively arranged therewith and with the said hemming and trimming device substantially as specified.

4. The combination, with the trimming and hemming device herein described, of the gage U V, substantially as specified.

136,652.—*Hand-Car.*—DANIEL M. HUNT, Southampton Mills, Pa.

A hand-lever is jointed to the end of the crank-axle, so the same may be thrown either in or out of action with the car-axle.

Claim.—The crank-shaft F of a hand-car, connected by a joint, *g*, with a hand-lever, A, so that it may be laterally moved by a lever, *i*, in the manner described.

136,653.—*Attachment to Carpenter's Square.*—JOHN HYMAN, Belvidere, N. J., assignor to himself and SAMUEL SHERRERD, same place.

A slotted scale or rule is attached to an ordinary carpenter's metallic square by an intermediate slotted link, which is secured in any desired position by a clamp or thumb-screw passing through a hole in the angle of the square, another thumb-screw serving to hold the slotted pieces together.

Claim.—The combination of the square, the slotted rule, and the slotted adjusting-arm, substantially as set forth.

136,654.—*Die for Forming Tubes.*—JOSEPH KINTZ, Meriden, assignor to himself and P. J. CLARK, West Meriden, Conn.

A die-block with two dies, which, in conjunction with a follower and a concave die, and at three successive operations, bends the skelp to the form of a tube with overlapping edges, which edges are afterward locked together by being forced into a groove in the mandrel.

Claim.—1. The dies A, B, and C, with the removable cleats F F and H, substantially as and for the purposes described.

2. The guides G G and I I, in combination with the dies A, B, and C, as and for the purposes described.

3. The mandrel D, with the groove J, in combination with the dies A and C, as and for the purposes described.

136,655.—*Car-Coupling.*—AARON K. KLINE, Readington, N. J.

The cars can be uncoupled without being separated, and the connecting-rods are adjusted automatically when separated.

Claim.—A draw-head having rear piece K backwardly-inclined on its top surface to receive and hold the coupling-rod when not in use.

136,656.—*Head-Block for Saw-Mills.*—DENNIS LANE, Montpelier, Vt., assignor to himself, PERLY P. PITKIN, and JAMES W. BROCK, same place.

The dog, after being driven into the log, is secured in that position by a cam.

Claim.—In combination with the log-rests P of a saw-mill carriage, a dog, H, having combined therewith an eccentric cam-lever, N, for locking the dog upon the rest P, constructed and operated substantially as shown and described.

136,657.—*Head-Block for Saw-Mills.*—DENNIS LANE, Montpelier, Vt., assignor to himself, PERLY P. PITKIN, and JAMES W. BROCK, same place.

A variety of holding-dogs are placed upon the setting-bar, so as to secure the timber to be operated upon under the many different shapes in which it is presented.

Claim.—1. In combination with the setting-up bar of a saw-mill carriage, the slide B, lever D, pawls E and F, ratchets A^2 and B^4, and dog *c*, substantially as and for the purpose specified.

2. The combination of the sliding dog P^4 on the post O with the upright N and setting-up bar A, substantially in the manner shown and described.

3. The combination and arrangement, with the upright support H, of the slide I^2, ratchet *z*, and locking devices, substantially in the manner shown and described.

136,658.—*Composition for Molding Plastic Articles.*—CHARLES LEGG, Malcom, assignor of one-half his right to HARRISON W. WIGTON, De Soto, Iowa.

Alum, sulphate of copper, and plaster of Paris.

Claim.—A composition for stove-pipe safes and other non-conductors of heat, prepared of the materials and proportions named, and in the manner set forth.

136,659.—*Step-Ladder.*—MELVIN N. LOVELL, Erie, Pa., assignor of one-half his right to FRANK F. ADAMS, same place.

The leg of the ladder when extended moves upward into a recess, and becomes there locked. The device is made in a single bracket-casting.

Claim.—1. A device for hinging the props or legs of step-ladders, whereby the said props are automatically locked when extended by changing the position of the center of motion of the said props, substantially as shown and described.

2. A device for hinging the props of step-ladders and automatically locking the same, substantially as herein shown, the same forming a part of the attaching-bracket, as set forth.

136,660.—*Magazine Fire-Arm.*—GEORGE D. LUCE, New Orleans, La.

Claim.—1. The spring-stud *m*, pivoted to the side of the carrier G, and having a point, *n*, projecting through a slot in the same, as shown and described, whereby it is adapted to swing with the carrier and exert a yielding pressure on the incoming cartridge, tending to arrest it against the action of the spring in the magazine, as specified.

2. The carrier G, arranged to swing on an arm, *g*, between the barrel and the magazine, and provided with a spring, *h*, for throwing it back, substantially as specified.

3. The combination of the guard-lever S, link V, and notched slide P with the pivoted carrier G, substantially as specified, whereby the cartridge may be withdrawn and the carrier swung down, as described.

4. The arrangement of a sliding retractor, P, provided with notches *e f*, with a pivoted carrier, G, whereby the flange of the cartridge is caused to drop into the notch *e* of the retractor as the cartridge is carried to the barrel by the carrier, and the flange of the shell is caused to escape from the said notch as the shell is carried down to the discharging tube, substantially as specified.

5. The retractor provided with the notch *q*, and the carrier with the stud *r*, in such manner as to retain the retractor during a portion of the return movement of the carrier, substantially as specified.

6. The combination of the breech-plate L, lever R provided with notch *s*, stud-pin Z and guard-lever for actuating said plate, substantially as specified.

7. The combination of retractor P, slotted link V, and guard-lever S, pivoted and arranged as shown and described, whereby the extremity of the inner or shorter arm of the lever may be brought nearer the retractor before the movement of the latter is commenced, and the rear or notched end of the retractor be thrown down to swing the carrier, as specified.

136,661.—*Swivel Hoisting Apparatus for Mines.*—THOMAS M. MARTIN, San Francisco, Cal., assignor to himself and ANDREW S. HALLIDIE, same place.

A revolving disk or drum has a pulley attached for the hoisting-rope to pass over.

Claim.—The frame A, with its shaft or drum B, in combination with the turn-table D, with its pulley *f*, substantially as and for the purpose above described.

136,662.—*Sample-Fastener.*—CHARLES MASON, New York, N. Y.

The wire is so bent as to form a spring-supporting frame with holding-pins projecting from each side, one to secure the device to the card, and the other to retain the goods to be displayed.

Claim.—The wire sample-fastener, consisting of spring *a*, base *b*, sides *b'*, and extensions *f*, placed on card-paper B, and applicable as and for the purpose described.

136,663.—*Arrangement of Couch.*—ELIZA LAVINIA MOORE, San Francisco, Cal.

To the middle portion of the chair is hinged the back, having hinged legs or supports, and held in any desired position by a circular rack-bar. The leg-rest is hinged to an upright standard at the side farthest from the chair, and the other side of the rest is connected to the chair-body by hooks. Over the middle portion of the chair is a frame composed of two uprights and a cross-bar, and rendered adjustable in inclination by two inclined supports, which are connected to the uprights by pins passing through holes in both the uprights and inclined supports. A suitable sling is attached to the cross-bar of the frame.

Claim.—1. The table or middle portion B of the couch, with its hinged extension C having the hinged legs *d d*, and arranged to be supported at any desired angle by the circular rack E and staple *f*, in combination with the end board G, with its angular braces *j j* and hinged leaf *k*, substantially as and for the purpose above described.

2. The frame, consisting of the upright timbers *n* and cross-timber *o* with its sling *t*, in combination with the couch B C *k*, substantially as and for the purpose above described.

3. The adjustable frame, consisting of the upright timbers *n* and cross-timber *o* secured in sockets *m* by pins *z*, in combination with the braces *p* provided with pin-holes so as to permit of the frame being braced at the desired angle for the purpose described, all combined with the couch B C *k*, as and for the purpose set forth.

136,664.—*Operating the Stops of Organs.*—HARTWELL R. MOORE, Erie, Pa.

The stop-handle being drawn, a toggle-lever attached is arrested by a stop-pin placed just beyond the axial line of the arms of said toggle; it returns at a touch, owing to the spring of the swell-valve against which it operates.

Claim.—The combination of the connecting-link B' with the

actuating-levers B and b, and the stop-pin H or its equivalent, for the purposes shown and described.

136,665.—*Spring for Bed-Bottoms.*—HARRISON OSBORN, Richmond, Ind., and ANDREW W. KENDRICK, Brooklyn, N. Y.

The top and bottom coils of the springs are made with a shoulder or indentation, into which the end of the coil is wound. The clasp is oval, forming a concave tube, into which the convex portion of the coil fits, so that the clasp operates as a flexible hinge.

Claim.—1. A metallic spiral spring, constructed with an indentation in one or both of its outer coils to receive the wrapped ends thereof, as described.

2. A connecting-clasp, D, bent so as to form an oval tube at each side thereof, for the purposes and uses, and in the manner described.

3. A mattress constructed of the springs A and clasps D, in the manner described, with a head or bolster elevation formed by graduating the length of the springs.

4. The springs A, constructed as described, in combination with the clasp D, when made and used in the manner and for the purposes set forth.

136,666.—*Combined Letter Sheet and Envelope.*—THOMAS ORTON, Chicago, Ill.

The end of a rectangular sheet is provided with side-sealing flaps and a printed head, which, when folded upon the body portion, presents an address form and a pendent sheet for the letter, which latter is folded within the lap of the former and sealed.

Claim.—A letter sheet and envelope combined, consisting of a rectangular sheet provided with side-sealing flaps at its extreme end, whereby it is adapted to be folded and sealed, as herein set forth.

136,667.—*Furnaces for Heating Iron Bars, &c.*—JOSEPH PARDOE, Worcester, Mass.

The fires are fed alternately, so that the gas from the fresh coal of one fire is consumed on the hearth by the heat of the incandescent coal on the opposite grate.

Claim.—The combination of the furnaces B B with the hearth A, arranged substantially as shown and described, for the purposes set forth.

136,668.—*Paper-Feeding Machine.*—MIGUEL PIEDRA, Williamsburg, N. Y.

As the cylinder is moved toward the right the plunger therein travels in an opposite direction, through means of suitable lever, until the orifice in the pipe attached to the cylinder is over the paper table, when the latter and a slide which opens a valve in the pipe are simultaneously operated through cam-shaft, slide, bearing-foot, and shaft. The atmosphere then presses the sheet against pipe, during movement of cylinder toward the left, until a pivoted lever closes the valve; pins which have held the plunger in its outward position during this movement being raised, and plunger forced back into cylinder by springs.

Claim.—1. The cylinder G, provided with pipe *g*, plunger H, and valve A, combined with the table J, all arranged to operate substantially as and for the purpose described.

2. The combination, with plunger H and notched rods *t*, of the spring-pins *s s*, arranged as and for the purpose set forth.

3. The spring *m*, arranged in combination with the yoke F, and spring-pins *s s*, and slides *t*, for forcing the plunger into the cylinder as soon as the latter has reached its forward position, as set forth.

4. The crank-shaft L, provided with projections a^1 i^3, and d^3, in combination with the table J and slide *m*, to raise the two latter simultaneously, as set forth.

5. The oscillating frame E and uprights *f*, arranged in conjunction with the yoke F, cylinder G, rock-shaft *e*, and connecting-rod D, to operate substantially as described.

6. The combination, with slide g^2 arranged in upright *f* and provided with a bearing-foot f^3, of the shaft I, and crank d^3, and shaft L, in the manner described.

7. The combination of the lever N, the plunger H, the lever P, and the valve A, to move the latter at the end of the forward motion of the cylinder G, as set forth.

136,669.—*Wheel for Vehicles.*—HIRAM PITCHER, Fond du Lac, Wis.

Claim.—The end-squared axle A provided with nut K and collar I, the sleeve C fast thereto and having the wearing-surfaces E F with intermediate oil-chamber Q, and the hub B having collar J and nut L, all constructed, arranged, and put together as and for the purpose described.

136,670.—*Fruit-Drier.*—JOHN L. POST, Ashley, Ill.

Several distinct drying-chambers are arranged around a central compartment, which is heated by steam-pipes, and in which a vertical fan revolves. Each chamber has shelves and an outer and inner door, the latter sliding in vertical grooves.

Claim.—1. A fan, or its equivalent, arranged in the central compartment so as to drive the air through the chambers, substantially as described.

2. The combination of the chambers a, compartments *b d*, pipes *c*, and fan *f*, when arranged as specified.

3. The chambers a, provided with inner doors communicating with the compartment *b*, so that when the doors are opened the heated air will pass up through the whole mass from the bottom, substantially as shown and described.

136,671.—*Treating Pine Leaves for Use in the Arts.*—CHARLES E. RAMUS, Lawrence, Kans.

Treating pine leaves and other similar articles by the use of chemical ingredients.

Claim.—1. The process herein described, or its equivalent, for treating pine leaves and other similar articles to render them fit for use in the arts.

2. Pine leaves and other similar articles treated by the chemical ingredients herein described, or their equivalent, for the purpose described.

3. The new material herein described.

136,672.—*Die for Forging Hoe-Plates.*—LOVELL T. RICHARDSON, Auburn, N. Y.

The back end of the bottom die is a flat surface, and the rest of the face is rounded off. The whole surface of the upper die is flat, but the edge is beveled on each side, the bevel increasing from the back to the front so as to taper the face of the die.

Claim.—The dies E and F, constructed and arranged, substantially as shown and described, for plating planters' hoes, as specified.

136,673.—*Grate for Furnaces.*—HENRY RYDER, Somerville, Mass.

A combination of a series of stationary grate-bars, and a series of movable grate-bars alternating with the stationary bars, with inclined guard at each end of the grates and mechanism for operating the said movable bars, all arranged to form a furnace for steam-generator.

Claim.—The combination of the series of stationary grate-bars *a*, the series of movable grate-bars *b*, the fire-place A, the inclined guards B, and the mechanism for operating the movable bars, all being constructed and arranged substantially in manner as explained and represented.

136,674.—*Wheel-Plow.*—LOUIS SACHSE, Monmouth, Oregon.

The spur-wheel revolves freely on the end of the axle, but when held fast by a lever, while the machine is in motion, causes the short arm to revolve around the said spur-wheel, thereby causing the axle to revolve. An arm on the axle is connected to an arm on rock-shaft, which, by means of connections and levers, raises the plows by the forward movement of the machine.

Claim.—The wheels O R, having axles N Q, connected by crank arm P, and provided with spur-wheels S T and lever U, in combination with the plow-frame A, as and for the purpose described.

136,675.—*Converting Rotary Motion of a Shaft into Reciprocating Motion.*—JAMES B. SINER, Lawrence, Mass., assignor to PARKER C. KIRK and MICHAEL PENDERGRAST, same place.

The shaft in its revolution revolves the screw and the gear-wheel, which, by means of the pin and the slotted lever, produces reciprocating motion of the shaft.

Claim.—The combination of the screw D, the gear C, the crank-pin E, the slotted lever G, the stud I, and groove K, all applied to the shaft A and its supporting-standard B, or the equivalent thereof, substantially in the manner and to operate as and for the purpose as specified.

136,676.—*Ruffling Attachment for Sewing-Machines.*—EDWARD STEWART, Fort Madison, Iowa.

By this device the gathers may be laid regularly, or when desired the strip may be left ungathered for a distance, according to the levers and projections on the ratchet-wheel. The feed-regulator is pivoted to the plate, is rocked in its bearings by the projections on the levers, and it carries a hinged pawl which may or may not project below the plate in the path of the actuating-lever. When the pawl is down a gather is formed, but when up the cloth is not gathered.

Claim.—1. The combination and arrangement of the levers *n*, provided with lateral projections *x*, with the feed-regulator *t*, substantially as shown and described.

2. The combination of the pawl *v* with the feed-regulator *t* and actuating-lever H, for operation as set forth.

136,677.—*Traction-Wheel.*—JOEL V. STRAIT, Litchfield, Ohio.

Between the outer peripheries of two wheels of the same diameter are arranged wrist-pins, which have projecting blades, which serve to exert traction when the wheels are revolved.

Claim.—1. The wrist-pins E E^1, rigidly connected to and in the wheels A and B, substantially as shown and set forth.

2. The connecting bars or blades F F, in combination with the wrist-pins E E^1 on wheels A and B, substantially as shown and set forth.

3. The construction of the wheels A B, by which the feet F F may be lifted up and set down on a vertical line, substantially in the manner and for the purpose set forth.

136,678.—*Medical Compound and Medicated Food.*—JEAN M. O. TAMIN, New York, N. Y.

Treats powdered peas, one part, with water at the ordinary temperature, two parts; decants or filters the mixture to a viscid consistency and adds gastric juice or finely-cut pieces of calf's stomach; dries by exposing to the air. Allows phosphoric vapors to slowly enter vegetable extracts until they are fully saturated with it.

Claim.—1. A medical compound formed of phosphorous united with gastric juice or comminuted portions of calf-stomach, dried and applicable in the manner and for the purpose described.

2. A liquid compound formed of phosphorous applied in a vaporous form to solutions of vegetable extracts, as and for the purpose described.

136,679.—*Wood Fence.*—DANIEL G. TEMPLE, Farmersville, La.

An upper and a lower horizontal rail are attached to the posts. Perpendicular pickets or boards are then fixed in place, wires secured to the far sides of the posts are extended outside of the pickets or boards in front and along the rails in the rear; in the center of each board and rail, or in each space between, enters a bolt, through the head of which the wire passes; and the wire is held by the clinched ends of the bolts in the rear, turned alternately up and down to make a zigzag line to keep the wire taut.

Claim.—The combination of the two wires D E and the clinched bolts or spikes F with the posts A, horizontal bars B, and pickets, boards, or planks C, in substantially the manner herein shown and described.

136,680.—*Medical Compound.*—HERMAN TREMEL, Escanaba, Mich.

Indian rhubarb, gentian, galangal root, wormwood, saffron.

Claim.—A compound formed of the proportions specified, of the five ingredients named, macerated in alcohol, and applied as set forth.

136,681.—*Sash-Holder.*—HENRY THOMAS, San Francisco, Cal.

Two or more loosely-fitting cams are arranged on a shaft running transverse the window-frames, and operated by a crank-handle lever.

Claim.—The combined sash stop and lock, consisting of the shaft *b*, with its loosely-fitting single cam or cams *d* and double cam *d'*, and the crank *f*, with or without a weighted handle, substantially as and for the purpose described.

136,682.—*Hot-Air Register.*—EDWARD A. TUTTLE, Brooklyn, N. Y.

Claim.—1. A top-valve hot-air extension pipe, A, passing through and a considerable distance above the floor, as and for the purpose described.

2. The screen-guard E, arranged with respect to a hot-air pipe, A, as and for the purpose set forth.

136,683.—*Fastening for Railroad-Rail Joints.*—SAMUEL VANSTONE, North Providence, assignor to HENRY LIPPITT, CHARLES H. MERRIMAN, and JAMES T. RHODES, trustees, Providence, R. I.

A device by which the joints of rails can be firmly fastened and easily tightened when worn by use, adapted to the fish-plates ordinarily used for this purpose, and avoids use of nuts on the bolts which hold the same.

Claim.—The fastening of joints of rails or other similar joints by means of slotted bolts with wedges extending through two or more bolts, the outer edges of which wedges shall form, when driven up, parallel, or nearly parallel, lines, producing a uniform bearing on the fish-plate, or either of the equivalent devices above referred to, the whole fastened substantially as described.

136,684.—*Fire-Proof Building-Block.*—WILLIAM T. VAN ZANDT and LUCIEN A. TABTIERE, New York, N. Y.

Claim.—The combination of asbestus and plaster of Paris with sawdust, coke-dust, cinders, sand, or other suitable material, to form fire-proof bricks or building-blocks.

136,685.—*Waist-Belt.*—JOHN H. VOGT and GEORGE DIETZEL, New York, N. Y.

A lady's waist-belt woven of fancy cord and gimp.

Claim.—As an improved article of manufacture, a waist-belt formed by a combination of fancy cord, B, for the warp and gimp C for the weft, with a binding-warp, E, and borders of fine warp, substantially as specified.

136,686.—*Wash-Boiler Attachment.*—NELSON C. WARNER, Hopewell Furnace, Mo.

An attachment for a wash-boiler, constructed concave in form with apertures, over which are cross-bars or supports for the clothing, with the apertures covered on its under side with valves to regulate the pressure of water, and an upright conductor in its center, with openings under a cap for the passage of the water and steam.

Claim.—The plate A, concave upon its lower side, convex upon its upper side, and having holes *a'* formed in it, the slightly-tapering central pipe B, having notches *b'* formed in its upper end and covered with a cap-plate, C, the guards D, and the valves E, constructed and operating in connection with each other, substantially as herein shown and described.

136,687.—*Hose Port-Hole for Partition-Walls.*—HENRY WOODMAN, Boston, Mass.

A boxed opening through a partition-wall, closed at ordinary times, to afford a means of inserting a hose-hoisle into a closed room in case of fire.

Claim.—The combination of the box A, the perforated partition B, the hinged doors C provided with locks D *d'*, hinged doors E, and springs F with each other, to adapt the device for use, substantially as herein shown and described, and for the purpose set forth.

136,688.—*Hand-Planter.*—RICHARD ARNY, Rock Falls, Ill., assignor to ALBERT M. PHELPS and FAYETTE DYER.

Forming the front of an oblong box is a vertical plunger, having pivoted to its back a segmental piece with a seed-cup on it, which deposits its contents into a cup on the outer face of a side of the box. The seed on the rise of the plunger is free to drop through the jaws at the bottom to the ground.

Claim.—The quadrantal-shaped slide C provided with opening *c* and extension A, and secured to the pivoted plate D, in combination with a seed-box, A, substantially as set forth.

136,689.—*Hoof-Spreader.*—THOMAS ARMSTRONG, Hamilton, Canada.

The spreader-arms and connecting-links are slotted and capable of fixed adjustment, so that the instrument can be used in various positions.

Claim.—The combination and arrangement of the levers *b' b'*, middle bar *c'*, tightening-screw *d*, spiral spring *e*, grooved washer *f*, handle nut *g*, and thumb-screws *h h*, substantially as described, and for the purposes set forth.

136,690.—*Pitman.*—HENRY AUFDEMBRINKE, Cincinnati, Ohio.

The pitman will, when any part of the mechanism it drives is suddenly checked by the displacement of a shuttle or other accidental obstruction, lengthen and shorten in such a way as to permit the machine to continue its motion without any corresponding movement of the mechanism the pitman drives.

Claim.—A pitman, composed of two sections, A A', secured together by a spring-clamp, and constructed, substantially as specified, so as to permit it either to shorten or lengthen in consequence of undue resistance to its endwise movement in one direction or the other.

136,691.—*Steam-Generator.*—GEORGE H. BABCOCK, Plainfield, N. J., and STEPHEN WILCOX, Brooklyn, N. Y.

Having a cylindrical shell between the outer shell of the boiler and a cluster of tubes within and a baffle-plate, whereby a circulation of water is kept up and the boiler prevented from foaming.

Claim.—1. The baffle-plate M, arranged relatively to the upright tubes D and boiler-shell A, as and for the purpose herein set forth.

2. The circulator G and baffle-plate M, in combination with the boiler-shell A, furnace B, and tubes D, all arranged for joint operation, as and for the purposes herein set forth.

136,692.—*Bed-Spring.*—JAMES H. BAKER and ASA DONEY, Saratoga Springs, N. Y.

A lower casting with flanges and a sleeve is secured to the bedstead-rail. An upper casting furnishes a rest for the slat, and a coiled spring works upon the pin.

Claim.—1. The casting A, provided with the flanges *a a* and sleeve *b*, in combination with the bushing *i*, wooden pin C, constructed and arranged as and for the purpose set forth.

2. The casting A, provided with the flanges *a a* and sleeve *b*, in combination with the leather bushing *i*, pin C, spring D, and casting B, all constructed and arranged as and for the purpose herein specified.

136,693.—*Combined Tool.*—WILLIAM BARTLE, Franklin, Pa.

Various small tools are arranged in a knife handle, with a spirit-level on one edge of the handle, the other edge being straight and parallel thereto.

Claim.—The pocket-tool described, consisting of the straight-backed case-handle, having a spirit-level in its front edge, and try-square, calipers, dividers, and cutting-blades pivoted to its ends, as specified.

136,694.—*Broom.*—CHARLES BOECKH, Toronto, Canada.

The brush or broom is made of slips of rattan, willow, or wire, collected in bunches and passed through tapering holes in a suitable block, the holes being widest at the upper ends. Each bunch is then twisted, and a tapering plug is driven into the center of the slips at their upper ends. The butt ends are then cut off, and a protecting-plate put on to prevent the plugs from working loose.

Claim.—The combination of bunches B of rattan or other suitable material with the back A, tapering plugs C, and a protecting-plate, D, said back being provided with tapering holes *a*, through the narrow ends of which the butt ends of the bunches are pressed, then twisted to admit the tapering plugs, while said plugs, after being driven home, are retained by the protecting-plate, substantially as set forth.

136,695.—*Smoking-Tube.*—ABEL BREAR, Saugatuck, Conn.

To prevent the loosening of the joint between the main tube and mouth-piece an elastic joint is introduced, into the front end of which a taper perforated smoke-tube is inserted, whereby the size of the joint may be slightly varied by forcing the taper tube in or out as desired.

Claim.—The combination, with the tube A and its mouth-piece D, of the elastic taper connecting-piece C and perforated stem S, substantially as and for the purpose set forth.

136,696.—*Bung-Bush.*—ORLANDO P. BRIGGS and LEWIS W. BRIGGS, Chicago, Ill., assignors of one-half their right to GEORGE W. GILLETT, same place.

The bush is provided with a circumferential flange to fit a corresponding recess formed in the stave around the bung-hole, and is threaded on its outer periphery about half way up, so as the bush is screwed down the unthreaded portion will crowd the wood outward, forming a tight joint. The bore of the bush is provided with an inwardly-projecting lug to enter a recess of a suitable wrench used in inserting the bush.

Claim.—1. A tapering bung-bush having a circumferential flange, D', with a downwardly-projecting annular bead, B, which, together with the tapering body D of the bush, set upon a raised seat, a, of the stave, substantially as and for the purpose specified.

2. The herein-described bung-bush, composed of the tapering body D, inwardly-projecting lug C, circumferential flange D', and downwardly-projecting annular bead B, substantially as specified.

136,697.—*Cotton-Press.*—JAMES M. BROOKS, Jr., Griffin, Ga.

Iron bands surround the press-box and pass over braces in such manner that when the press is ready for loading the openings are at right angles to the follower. The press also has a folding and portable frame and a foot-piece for the support of the spindle of the press-frame.

Claim.—1. The frame for holding the bale-box constructed as described, each side formed of the bars H H and I I, surrounded by a metal strap, G, and the two sides connected by the bars E and E', all substantially as herein set forth.

2. The exterior frame or support, consisting of the beam A with tenons *b b*, the legs B B with staples *a a*, and the brace-rods C C, all substantially as herein set forth.

136,698.—*Apparatus for Hoisting and Dumping Loaded Wagons.*—WILLIAM JAMES BROWN, Momence, Ill.

The differential hoisting-winch and the wagon are connected by two chains, the one for hoisting and the other for tilting it while it is suspended from the first chain.

Claim.—1. The winch-shaft D of varying diameters, connected by a cone, for operating successively the lifting and tilting chains O and R, substantially as described and shown.

2. The bail S, cord T, and pulley *g*, as and for the purpose set forth.

3. The construction and arrangement of the platform A, posts B B', beams G G', guide-pulleys *f f' d d'*, differential winch-shaft D, gears E K L M, counter-shaft J, crank-shaft N, ratchet I, pawl *b*, chains O R Q, pulley *c*, and bar P, substantially as and for the purposes set forth.

136,699.—*Lubrication of Clutch-Pulleys.*—AUGUSTUS CANIS and FREEMAN HIGGINS, Manchester, N. H.

The outer surfaces of the pulley are always free from oil, and no oil can be thrown in contact with the work upon the loom.

Claim.—The axial pin *k* with its pivot *i* and oil-passage *n*, and the clutch-pulley *a* with its oil-chamber A, oil-hole *f*, and tapering socket *g*, the form and arrangement of the parts being substantially as shown and described.

136,700.—*Apparatus for Comminuting Various Substances.*—GEORGE B. CARNING, Brooklyn N. Y.

The pestles are operated by means of tappets constructed upon the chains, one of which is arranged opposite each pestle respectively. These tappets while passing from the lower to the upper pulley engage with studs projecting from the shanks of the pestles, and thereby raise them until the tappets commence to pass over the upper pulley, when they disengage, and the pestles fall. A lifting-bar is so arranged that it will engage with a series of studs affixed to the pestle-shanks to raise them simultaneously when it is desired to remove the substance from the mortar. A series of steam-pipes is also arranged around the mortar to heat the same when desired.

Claim.—1. The combination, with the series of pestles B, of a series of chains and chain-pulleys arranged upon a common shaft, as shown, the chains being provided with tappets H, which act on the pestles by means of spurs I, which project therefrom, as described.

2. The combination, with the series of pestles, of a lifting-bar, K, arranged so as to raise the whole series out of the mortar simultaneously, substantially as described.

3. The combination, with a mortar, of steam-pipes J to heat the same and its contents, substantially as described.

136,701.—*Sewing-Machine Table.*—JAMES W. CHENEY, Detroit, Mich.

A sewing-machine table extension connected with the table by curved hooks and eyes, attached to the machine and extension, and by the form of the hook detached at will. The extension or box extends down, and is held in an upright position by a frame attached to the machine with an arm, which, when not in use, is held up by a spring-jaw.

Claim.—1. The plates D B, provided, respectively, with a pendent curved hook and a receiving-slot, when applied to the cover and table of a sewing-machine, for the purpose and in the manner specified.

2. In combination with the cover and table of a sewing-machine arranged as described, the hinged supporting-arm H, bracket G, spring-jaws K or equivalent device, as and for the purpose specified.

136,702.—*Clamp for Button-Hole Sewing-Machines.*—WILLIAM CHICKEN, Boston, Mass., assignor to AMOS L. WOOD, trustee, same place.

The "clamp-levers" are secured to a hinged block, and are moved to or from each other by means of a slotted lever that receives pins projecting from the levers. The levers are raised by means of an eccentric block pivoted to a standard and connected by link with a cross-head that receives the levers.

Claim.—1. In combination with the clamp-levers and the eccentric for depressing them, the link *p*, or its equivalent, for raising the levers, substantially as described.

2. In combination with the levers *b c*, the lever *e*, having the eccentric slots *q r* through which the lever-pins A extend, the lever *e* operating to spread the levers *b c*, or to draw them inward and to look them in position, all substantially as described.

3. In a clamp for button-hole stitching-machines, clamp-jaws combined with mechanism, substantially as described, whereby the jaws are positively moved laterally to any required extent, however slight, and are positively held in any position to which they are brought.

136,703.—*Coffee-Pot.*—HENRY J. CHILDS, New York, N. Y.

The coffee is introduced within a cylinder with a movable convex strainer and retaining perforated diaphragm at the bottom, by means of which the hot water is retained in contact with the coffee, and passes gradually into the pot, and the grounds and deleterious substances are retained in the cylinder.

Claim.—The cylinder *c*, hanging within the coffee-pot from the flange at its upper end, in combination with the convex diaphragm *h*, rim *i*, and strainers *l* and *n*, as and for the purposes set forth.

136,704.—*Lamp-Chimney Cleaner.*—BYRON E. CHOLLAR and JOHN G. JOHANNES, Leavenworth, Kan.

Near the end of the rod two disks are secured, at a little distance from each other. Each of these disks is serrated around its circumference in such a manner as to form a series of teeth, which are bent alternately forward and backward, forming hooks, which retain their hold on the cloth-wiper, whether the device be moved backward or forward or revolved in the chimney.

Claim.—The wiper-rod, provided with the double annular series of points *a*, alternately bent forward and backward to form hooks whereby the cloth will be held against any movements of the wiper, substantially as specified.

136,705.—*Extension Table.*—MATTHEW COLEMAN, Ionia, Mich.

The extension slides are provided with grooves and tongues; also central grooves containing horizontally-revolving rollers; and said slides are combined and secured together by means of cross-bars extending from the slides on one side of the table to the slides on the opposite side.

Claim.—The slides A and A, provided with the grooves *a* and *a''* and with the tongues *a'* and *a'''*, containing within their central grooves the horizontally-revolving rollers B, and combined by means of the cross-bars D, substantially as and for the purpose specified.

136,706.—*Machine for Pressing Soles.*—FREDERICK W. COY, East Cambridge, assignor to WILLIAM BUTTERFIELD, Boston, and CHARLES KENISTON, Somerville, Mass.

The mold-plate, resting upon an adjustable platen, receives vertical movement from an eccentric or cam gear. An arm, attached to the platen and actuated by the cam-gear, moves the platen forward as it descends, that the work may be readily removed.

Claim.—1. In combination with the movable platen *c*, the eccentric gear-wheel *i* and gear-pinion *k* having roller-rims *l m*, substantially as shown and described.

2. In combination with the movable platen *c*, the platen-slide *r*, automatically moved to the front, and vice versa, substantially as described.

136,707.—*Combined Rocking-Horse and Swing.*—BENJAMIN P. UMANDALL, Jr., and WILLIAM TWIDDY, Williamsburg, N. Y.

From the detachable seat of the hobby-horse project forward two arms surmounted by horses' heads, to which, and to the rear of the seat, are fastened eyes, by which to connect swing-ropes when the said seat is detached.

Claim.—1. A rocking horse or chair provided with a seat-board, F, formed with forwardly-projecting arms G for securing the same to the base or rocker frame D, as herein set forth.

2. In a rocking-horse, the detachable seat or upper portion F, formed as shown, secured to the base or rocker portion, substantially as described.

3. The combination with the detachable seat portion F, constructed as described, of suspension ropes or rods Q Q, as described, for converting the same into a swing, as herein set forth.

136,708.—*Cultivator.*—WILLIAM P. DALE, Agricultural College, Pa.

The forward part of the machine is mounted on guiding caster-wheels, which are controlled in their movement by the hand-lever b^3.

Claim.—1. In a cultivator, the caster-wheels B^2, brackets B^4, friction-rollers *a* and fifth-wheel B^1, substantially as specified.

2. The draw-hinges J, as described, connecting the laterally and vertically adjustable shovel-beams I to the transverse bars I', substantially as specified.

3. The perforated flanged cross-piece F', in combination with the perforated longitudinally-adjustable beam-braces K and adjustable shovel-beams I, substantially as and for the purpose set forth.

4. The bar *d*, arms d^1 *e*, bar *e'*, lever H, and rack H', in combination with the frame D and hounds B, substantially as specified.

136,709.—*Railway Snow-Plow.*—THOMAS A. DAVIES, New York, N. Y.

Claim.—The tubular snow-plow herein described, having the inclined bottom A made straight transversely and increasing in width from front to rear, the top or cover D of corresponding form, but placed at a less horizontal angle, the sides E inclining outward or from each other, from bottom to top and front to rear, and a discharging-section, F, all as shown and described, whereby the cubical capacity of the plow is greatest at the mouth and least at the rear end, and the same adapted for tunneling through or removing snow from a track, in the manner hereinbefore set forth.

136,710.—*Branding-Stamp.*—J. WESLEY DODGE, Malden, Mass., assignor to "THE SHOE-MACHINERY MANUFACTURING COMPANY OF CONNECTICUT."

The auxiliary type, representing fractional numbers, has a notched stem which fits into the recessed flange of the type-wheel, where it is sustained, when at the impression point, between the jaws of the holder.

Claim.—In combination with the recessed wheel *s*, the movable fraction or auxiliary type *r*, applied to the wheel, and locked and confined in place substantially as described.

136,711.—*Roller-Skates.*—OLIVER H. DODGE, Jackson, Tenn.

The truck is connected to the skate without springs.

Claim.—The combination, with the foot-pad A, of the rocking bolster B, pin *a*, swinging bolster C, screw *b*, rollers E E, and truck D, with projecting tongue *d* hinged by the pin *c* in the bifurcated and beveled end of the post G, all substantially as and for the purposes set forth.

136,712.—*Machine for Mining Coal.*—CHARLES L. DRIESSLEIN, Chicago, Ill.

The current discharged from the pipes impinges directly against the buckets upon the saw.

Claim.—In a machine for mining coal or for quarrying or channeling rock, fire-clay, or other similar substances, the combination of a directly-attached saw and driving-wheel, with the inlet and exit passages or pipes for the water or compressed air that drives them, and the bearings for sustaining them, substantially as and for the purpose described and represented.

136,713.—*Butter-Bucket.*—JOHN F. DUMONT, Kansas City, Mo.

A bucket with its body constructed of one piece bent to form, with an enlarged bottom having on its surface a projecting flange to which the body is closely fitted, with a cover having a flange projecting downward fitted to the upper end of the body of the bucket, and the parts held in position by wire braces passing over it and connected with the bottom, and serving to confine the top by passing over bent ends of the handle.

Claim.—1. A bucket composed of the detachable flanged disks B B and cylinder A, constructed to fit together as and for the purpose described.

2. The wires C C passing through and fastened to bottom B', and having parts *c c* movable over the top B, as and for the purpose set forth.

3. The handle D passing through staples *d d* in top and having two bends, one at right angles to the other, so as to form the ends *d' d'*, in combination with the bucket, as and for the purpose specified.

136,714.—*Carpenter's Bevel.*—HENRY FAIRBANKS and ISAIAH J. ROBINSON, St. Johnsbury, Vt.

Two slotted blades set on the same pivot in the stock are provided with separate clamps, by which, while one of the blades is held at a right angle, the other may be fixed at any desired angle.

Claim.—1. The two bladeq B C, arranged in the same slit in the handle, and provided with means for clamping both, combined with the plate D acting as an independent clamp for one blade, the whole constructed and operating substantially as specified.

2. In a bevel-square, the arrangement of the elastic plate D in the handle, the said plate rigidly attached to the handle at its lower end, its upper end so as to be set down to hold the blade of the square at the angle defined by the end of the said plate, or returned into the handle to leave the blade free for adjustment to other angles, substantially in the manner described.

3. In combination with the subject-matter of the second clause of claim, the slide F or equivalent for setting the plate D in a position to hold the blade B, substantially as set forth.

136,715.—*Loom-Shuttle.*—DAVID C. G. FIELD, Lowell, Mass.

The spring friction-brake is composed of a single piece of wire having two coils so arranged that the plate or pad pushes in a direct line toward the eye of the shuttle, or perpendicularly to the axis of the quill.

Claim.—1. The brake upon the quill B, composed of the spring C acting upon the plate G, said spring being constructed as herein shown and described.

2. The combination of the slotted stud H, spiral spring E, compression-nut F, with the spring C acting upon the plate G, constructed and arranged substantially as described.

136,716.—*Oil-Press.*—WILLIAM M. FORCE, Newark, N. J.

Claim.—An apparatus consisting of rack C, or its described equivalent, plates E, provided with ears or projections D, constructed in the manner, and in combination with any suitable motor or press, as and for the purpose substantially as described.

136,717.—*Harrow.*—LEANDER C. GIFFORD, Monticello, Ill.

Connecting harrow-frames by means of compound clevis-joints, by the use of which the harrow may be folded or laid one section on the other; also to allow either section to yield to obstructions.

Claim.—The compound clevis, consisting of the plates *a*, *b*, *c*, and *d*, constructed as described, in combination with the harrows A and B, substantially as and for the purpose set forth.

136,718.—*Sewing-Machine.*—EBENEZER A. GOODNE, Philadelphia, Pa.

The needle-bar is provided with two or more needles, and may be rotated or set, as required, to produce ornamental stitching of various kinds. The needle-bar is rotated by means of a cam-cylinder and sleeve thereon, operated by a fixed but adjustable pin, J. The feed-bar is provided with devices whereby the cloth is moved forward in a straight line or laterally either way from the needle, and for any number of stitches, this action being controlled by a cam, U, which in turn is moved slowly or rapidly by means of the toothed shell, which has teeth of different lengths, and may be adjusted on its shaft so that more or less teeth engage the wheel S at each revolution of the main shaft.

Claim.—1. The needle-bar, rotating by means of the cam-cylinder G and engaging-pin J, substantially as described.

2. The mechanism for causing the reverse rotation of the needle-bar, consisting of the sliding sleeve K, in combination with the cam-cylinder G and pin J, substantially as set forth.

3. The swivel-collar L and its set-screw, as described, in combination with the removable pin J and cam-cylinder G, for controlling the needle-bar as to rotation.

4. The take-up mechanism, consisting of arms M N, constructed as described, in combination with the pin *j* of the needle-arm, substantially as and for the purpose described.

5. Mechanism, substantially as herein described, for automatically controlling the feed movement for forming the ornamental stitches.

6. The slide W, cam U, and oscillating guide X, in combination with the feed-bar, substantially as and for the purpose described.

7. The adjustable toothed shell P, substantially as described, in connection with the feed-bar and intermediate mechanism, for imparting variable motion to the feed-bar.

8. The shell P, having differential teeth R, substantially as and for the purpose described.

9. The lever Z, in combination with the slide W, cam U, guide X, and the feed-bar, substantially as described, for controlling the feed movement by hand.

10. The lever V, in combination with the slide W, guide X, and laterally-yielding feed-bar, as described, for adjusting said slide to vary the extent of lateral inclination imparted through the guide X to the feed-bar.

136,719.—*Traveler for Spinning-Rings.*—JOHN GOULDING, Worcester, Mass.

For keeping the yarn, which is passing to the spindle or bobbin, always at the same angle therewith, whether the bobbin be nearly empty or whether it be nearly or quite filled. The tension is thereby made uniform and an even yarn produced.

Claim.—A traveler, consisting of the bar *f* secured loosely at its opposite ends to the rings *e*, substantially as and for the purpose set forth.

136,720.—*Artificial Curl.*—JOHN GRAHAM, New York, N. Y.

The method of weaving causes even a single curl to hang without twist or exposure of the woven portion.

Claim.—An artificial curl of a single coil united by the warps and interwoven in the manner and for the purposes set forth.

136,721.—*Apparatus for Crushing, Grinding, and Mixing Molding-Sand, &c.*—JEAN OCTAVE HANCIN, Paris, France.

The furrows made by one crusher are divided by the second. Two conical-toothed scrapers, mounted on the shaft carrying the crushers, clear the sand and prevent the clogging of the grooves.

Claim.—1. In an ordinary crushing-mill, the combination of a plain bed with the conical grooved and multiple crushers A A, arranged to operate substantially as set forth.

2. The combination, with the crushers A A, of the conical-toothed scrapers M M, substantially as and for the purposes hereinbefore set forth.

136,722.—*Composite Roofing.*—SAMUEL C. HOGUE, Oskaloosa Iowa.

The roof is formed of the two compositions named in the claims, laid in layers, the latter above the former, preparations being first made by a covering of felt over the roof-boards, upon which an adhesive paste of flour and water and plaster of Paris is spread.

Claim.—1. The combination of coal-tar or crude benzine, linseed-oil, gum-parra, gypsum or soft stone, and crude glycerine to form a roofing-cement, substantially as specified.

2. The combination of gypsum or plaster of Paris, flour, gum-arabic, substantially as and for the purpose specified.

3. The compound roofing composed of the layers formed in the manner and applied to a roof substantially as described.

136,723.—*Combined Latch and Lock.*—ANDREW J. HOLLENBACK, North Bangor, N. Y.

This invention consists in giving such shape to the common pivoted and balanced tumbler and to the weighted latch that both may be used together in the same case. The tumblers are inclosed between the three sides of the weighted latch.

Claim.—The pivoted and weighted latch B occupying three sides of the chamber, as shown, and provided with the arm A, the balanced pivoted tumbler E, constructed as described, and arranged within the space inclosed by the latch, and the elevator C acting under and against the upper arm of the latch, all constructed, arranged, and operating substantially as and for the purposes set forth.

136,724.—*Cylinder-Cock for Locomotives, &c.*—CHARLES H. HOPKINS, Lyndonville, Vt.

Claim.—An improved steam-cylinder cock, consisting of the reservoir B, provided with the guide C and internal longitudinal ribs *a*, the spring A, plunger *f* provided with its stem or rod E, the finger *n*, and the longitudinally-sliding rod *g*, all constructed, arranged, and operating substantially as described.

136,725.—*Cotton-Press.*—CHARTER CAMPBELL HOWARD, Lowndesborough, Ala.

Two rack-bars fixed to the top of the press, that when the follower-head is on a level with the top of the press an additional lever or levers may be used to press the follower-bar further down.

Claim.—1. In combination with the follower-rod or bar D, the toothed bars A A and the levers H H operating on the end of the follower-bar, substantially as and for the purposes herein set forth.

2. The combination of the frame A with bale-box B, follower C, bar D with toothed bars *b*, rollers *c c*, stirrups G, pawls *f*, toothed bars A, and levers E H, all constructed and arranged substantially as and for the purposes herein set forth.

136,726.—*Subsoil-Plow.*—JOHN W. HOWARD, Greenville, Ala.

A wing is attached to the lower rear part of the plow-colter at an oblique angle and extending behind it, so that in its operation a small portion only of the subsoil is raised and mixed with the surface-soil.

Claim.—1. The wing G, constructed as shown and described, and attached to the blade C so that the point of the wing will be nearly in rear of the cutting-edge of the blade, substantially as and for the purposes herein set forth.

2. The combination of the plate C, strip D, rest E, and wing G, all constructed and arranged substantially as and for the purposes herein set forth.

136,727.—*Cylinder for Sole-Buffing Machines.*—JARVIS HOWE, Milford, Mass., assignor to THE SHOE-MACHINERY MANUFACTURING COMPANY, Connecticut.

The cylinder is constructed in halves and encompasses a shaft, its outer surface of sand-paper, which is secured to the inner faces of the cylinder by means of wire springs. The ends where the halves are united are cone-shaped, one end slipping into a conical socket, while the other, provided with a screw-thread, is rigidly held by means of a nut.

Claim.—1. The cylinder or rolls formed of the halves *b c*, and having the sand-paper or abrasive cover *e*, the halves being held together and upon the roll by the socket *n* and nut-ring *o* that encompass and clamp the cones *l m*, all substantially as shown and described.

2. The springs *s*, holding the sand-paper *r* by their stress, and pressing into the surfaces beyond the working-surface of the cylinder, substantially as shown and described.

136,728.—*Snap-Hook.*—GEORGE M. HUBBARD, New Haven, Conn., assignor to W. & E. T. FITCH, same place.

A hook is combined with an elastic or spring tongue to automatically close the mouth of the hook.

Claim.—The hook A, constructed with the opening *b* through the shank and between the cheeks for the insertion of the tongue C, and with a seat, *f*, upon each side of said opening for the trunnions *n* of the tongue, and provided with a spring to hold said trunnions in said seats and act to close the tongue, all substantially as set forth.

136,729.—*Locomotive.*—WILLIAM S. HUDSON, Paterson, N. J.

The steam from the high pressure cylinder passes through the smoke-box to be superheated before entering the expansion-cylinder: has, also, diaphragms in the smoke-box to guide the steam. The high-pressure cylinder is on one side, and the expansion-cylinder on the other side, of the locomotive.

Claim.—1. The superheating-vessel H, in the form of a broadly-extended diaphragm, perforated by tubes h and provided with one or more partial partitions, h', arranged as herein specified.

2. The arrangement, in the smoke-box of a locomotive, of a drying and superheating vessel, with connections to the two cylinders, the whole so operated that the live steam shall be received from the boiler into one cylinder and exhausted therefrom into the other cylinder through the said superheater, as herein specified.

3. A locomotive having a secondary live steam pipe, E, leading to the second cylinder D^2 and controlling-valve *e*, with means for operating from the foot-board, in combination with the main steam-pipe C leading to the other cylinder D^1, and arranged for joint operation relatively to the boiler A, and the means for exhausting from the one cylinder into the other and superheating, as herein specified.

136,730.—*Reservoir Cooking-Stove.*—JAMES R. HYDE, Troy, N. Y.

Air is admitted into the chamber behind the fire-pot through apertures in the sides of the stove. The heated air is thence conducted to the sub-flue in the base and passes up the rear of the stove and between the boiler and hot closet upward to the exit-pipe.

Claim.—1. The slot *a* in the side of the stove-body, in combination with the back fire-plate H and front plate I of the oven, with a hot-air chamber between, substantially as and for the purposes herein set forth.

2. The combination of the vertical flue *b* with the hot-air chamber between the oven-plate I and back fire plate H, and the slot *a* in the stove-body, substantially as and for the purposes herein set forth.

3. The flue G in the bottom plate of the stove, substantially as and for the purposes herein set forth.

4. The combination of the flue G, flue *b*, the hot-air chamber between the plates H and I, and the slot *a* in the stove-body, all substantially as and for the purposes herein set forth.

5. In combination with the long flue G, the vertical flue *g* and the slot *r* in the back-plate of the stove, all substantially as and for the purposes herein set forth.

6. In combination with the flue *g* and the slot *r* in the back-plate, the sliding damper *m*, provided with the slot *s*, and bent at its top to close the flue, all substantially as and for the purposes herein set forth.

7. The combination of the flue G flue *g*, slot *r* in the back-plate, slotted damper *m*, flue *g'* and flue *g''*, with a water-reservoir, I, all substantially as and for the purposes herein set forth.

8. In combination with the flues *g' g''*, the flue *g'''* with slot *s* and sliding damper O, all substantially as and for the purposes herein set forth.

9. The combination of the warming-chamber P with the flues G *g*, slotted and bent damper *m*, and flues *g' g''*, all substantially as and for the purposes herein set forth.

10. The flue *g'*, spread outward at its center and arranged on the bottom of the reservoir I, as and for the purposes set forth.

136,731.—*Door-Check.*—G. CHRISTIAN IDLY, Burlingame, Kans.

A metallic block, flanged and recessed, is screwed to the floor near the point where the open door swings back against the wall. In this block is fitted a latch having its beveled hook turned upward; a spring beneath the latch; a lever with foot-piece above the latch; and surmounting the lever a rubber cushion or bumper. There is also secured to the inside of the door a metallic box-catch, into which the beveled catch works automatically, thus holding the door wide open until the latch is released by pressure on the foot-piece of the lever.

Claim.—The latch-holder A, having the beveled latch B, spring E, pivoted foot-lever D, and India-rubber cushion G, in combination with a catch-box, C, all constructed and arranged substantially as specified.

136,732.—*Whip-Socket.*—GEORGE H. JEWETT, Saline, Mich., assignor of one-half his right to JACOB HORTON, same place.

The whip-socket is secured to the dash-board by means of a brace with two curved arms or prongs, upon the outer ends of which are projections or enlargements. These arms or prongs are passed through the dash-board, and a plate or disk is placed on their ends, which plate has in it two slots, and upon its outer surface and along the inner edge of each slot is an incline, against which the projections bear when the plate is put on the arms, so that when the plate is turned the socket will be firmly wedged to the dash-board.

Claim.—The combination, with a skeleton whip-socket, constructed substantially as described, of the whip-socket fastening, consisting of the arms *b b* having projections *c c*, and the plate G having slots *d d* and inclines *e e*, all substantially as and for the purposes herein set forth.

136,733.—*Hoe.*—MOSES JOHNSON, Three Rivers, Mich., assignor of one-half his right to ABRAHAM FEAS, same place.

The body of the hoe is made from a flat plate slitted on one side near the middle, and one wing turned to the right and the other to the left. The goose-neck handle is attached to the upper edge.

Claim.—The improved hand implement or hoe, having the side wings *b b'* arranged one in front of the other, and the upright cutter D, substantially as specified.

136,734.—*Foot-Rest for Chairs.*—THEODORE A. JOHNSON, Portland, Me.

About the center of the rest, on each side, is pivoted an arm, and these arms at their other ends are pivoted to the front of a chair. When the rest is to be used hooks on the rear of the rest engage with lugs or eyes attached to the front of the chair. When the rest is swung under the chair it is held in position by a hook secured to a cross-bar near the rear of the chair.

Claim.—The detachable foot-rest herein described, consisting of the arms *a*, piece *b*, (with or without the piece *d*,) hooks *c*, and catches and the hook *a* or its equivalents, constructed and applied substantially as herein set forth.

136,735.—*Truss-Pad.*—NATHANIEL JONES, Syracuse, N. Y.

The pad is made of pyroxyline or solid collodion, which may be softened and molded to any desired form, and which avoids the unpleasant effect of the sulphur in the hard rubber heretofore used.

Claim.—The truss plate or pad made of pyroxyline as a new article of manufacture.

136,736.—*Expanding Boring-Tool.*—JOSEPH K. KACHEROVSKY, Bridgeport, Conn.

The cutters are placed in radial slots in the cylindrical holder with the back of each resting against cams formed on an internal arbor. Two collars on the arbor, with grooved cams into which lugs on the cutters are placed, hold the cutters and draw them back. The arbor is turned to throw the cutters out and in by a pin projecting from it through a slot in the stock or holder.

Claim.—The male or cam-body portion *f* of the arbor D, in combination with the female or inner grooved cams E, the radial sliding cutters B B, the cutter-carrier C and main body A, substantially as specified.

136,737.—*Oyster-Winder.*—WILLIAM H. KANNE, Baltimore, Md.

Combination of the upright locking and unlocking lever with the oval frame, pins operating in the groove of the shifting-pulley, and curved rack gearing into the teeth of the loose and reversible windlass, and the locking-blocks, when constructed, arranged, and operating.

Claim.—The combination of the upright locking and unlocking lever D with its oval frame G, pins H it operating in the groove of the shifting-pulley K, and curved rack P gearing into the teeth N of the loose and reversible windlass M, and the locking-blocks R R and S S, when constructed, arranged, and operating as herein described, and for the purpose of dredging oysters, as set forth.

136,738.—*Combined Oil-Can and Torch.*—WILLIAM KELLEY, Baltimore, Md.

An oil-can, to the handle of which is attached, by means of a sliding spring, the oil-reservoir for the torch, which can be regulated with regard to its length by means of said spring.

Claim.—1. In combination with an oiler, A B C, a torch slipping over the oiler, and capable of being raised or lowered on the same, substantially as and for the purposes herein set forth.

2. The spring-band *a a*, constructed as described, and attached to the torch-wick reservoir *d*, substantially as and for the purposes herein set forth.

3. The knob or heel *b* on the reservoir D, for the purposes herein set forth.

4. The oil-reservoir G for the torch, constructed as shown, so as to rest upon the oil-can A and handle B, as set forth.

5. In combination with the torch-wick reservoir D and torch oil-reservoir G, the extension pipe E, for the purposes herein set forth.

6. The spring catch H attached to the reservoir G, and catching in the handle *h*, substantially as and for the purposes herein set forth.

136,739.—*Automatic Gas-Lighting Apparatus.*—FRANZ KORWAN, Manheim, Germany, assignor to himself and MICHAEL FLUSCHEIM, New York city.

A flexible diaphragm, operated by the illuminating-gas, is connected with a rotary valve having two ways for conducting gas to the main and auxiliary burners. The connections with the diaphragms and the adjustment of the ways are such that when gas is being turned on through main burner the auxiliary flame shoots up and ignites it. When the illuminating flame is at full head, the auxiliary flame is at its minimum, as it also is when main flame is extinguished. Any number of burners may be operated by this one device.

Claim.—1. One or more cocks, valves, or their equivalents, actuated by a flexible or movable diaphragm, C, operated by the pressure of the illuminating-gas supply, which can be regulated by weights J, or their equivalent, for the purpose of igniting and regulating one or more gas-jets.

2. The combination, with the tube L of the auxiliary burner, of the screw *l* for regulating the influx, and the screw *k* for regulating the efflux, of the gas, as set forth.

3. In combination with the described gas-lighting apparatus, a screw-cock, *e*, for regulating the flame at H under increased pressure, substantially as set forth.

4. In combination with the diaphragm C, actuating the stop-cock of a gas-lighting apparatus, the pivot-bearings *o p* for overcoming the friction on the plug, substantially as set forth.

136,740.—*Window-Screen.*—SHEPHERD T. LIPPINCOTT, Elizabeth, N. J.

The combination of parts claimed forms an improvement in that class of window-screens which retract into a case at the bottom of the window by means of a spring, when not in use. When used the edge-plate is drawn up and hooked upon the lower edge of the raised sash.

Claim.—1. The combination of caps E and E', bearing-pieces F and G, spring-roll C, attachment A, and case D, substantially as herein described.

2. The combination of the caps E and E', bearing-pieces F and G, washer H, spring-roller C, case D, screen A, and metallic strip B, as and for the purpose herein set forth.

136,741.—*Aging Wines and Liquors.*—ADOLPH LUQUET, San Francisco, Cal.

The wine is forced through pipe *a* into the larger inclosing-pipe *b*, and from this into the pipe C, then into a chamber, after which it circulates through the coil of pipe, where it is heated and then passed into the smaller inclosed pipe where it is cooled, and finally is passed through a pipe to the receiving-cask.

Claim.—1. The process herein described of treating wines by forcing it through coils or pipes surrounded by heated water, and through a cooling-pipe, A, surrounded or inclosed by a pipe, *b*, containing cold wine, as set forth and described.

2. In combination with the apparatus, consisting of coils *c e* and water-spaces *f f*, the double outer coil *b* and A, as set forth and specified.

136,742.—*Safety Pocket-Hook.*—PETER E. MALMSTRÖM and PAUL E. DUMMER, New York, N. Y.

A safety pocket-hook formed at the end of a piece of wire that is bent in the form of the letter L and provided with two eyes in such a manner that the wire can be readily secured to the inner surface of the lining of a pocket, while the hook is passed through a hole in said lining.

Claim.—The safety pocket hook B, formed with eyes *a* and *b* for securing it to the lining of a pocket, as described, and with a hook, A, at its end, for extending through the lining into the pocket for receiving the article to be secured therein, as set forth, all constructed and arranged substantially as described.

136,743.—*Pegging-Machine.*—GEORGE W. MANSON, Auburn, Me., assignor of one-half his right to ADDISON A. MILLER, same place.

The spring serves to check further movement of the driving-shaft after shifting the belt from the fast to the loose pulley.

Claim.—In a pegging-machine, the combination with the awl-carrier and its driving-shaft of a spring or springs connected to said shaft and operating in the manner described, for gaining the advantages specified.

136,744.—*Sign.*—EDGAR M. MAY, Fond Du Lac, Wis.

A current disk, to which a many-colored hollow cylinder is so attached as to surround the light, is made to revolve within a show-lantern by the rising of the air heated by the lamp-flame.

Claim.—In a show-lantern a hollow revolving cylinder suspended inside the lantern and caused to revolve by the current from the lamp, substantially as shown and described.

136,745.—*Hose-Bridge.*—JOHN E. MCCAULLAY, Philadelphia, Pa.

The hose is protected from injury by being carried over the cars upon the frame described, instead of by the usual manner of carrying the car over the hose.

Claim.—1. The hose-bridge, composed of the upright sections A and braces *a* holding the forked devices *b* b^3, substantially as and for the purpose specified.

2. The uprights A, having hinged or stationary feet or base supports, and provided with the hose-holders *b*, substantially as and for the purpose specified.

136,746.—*Combined Globe-Valve and Trap.*—HUGH J. MCMAHON, Philadelphia, Pa.

Having a graduated slotted tapered screw-plug in the valve, so that when said valve is closed the screw-plug may be used for a trap or waste-cock.

Claim.—The combination, with the waste cock, of a passage between the inlet and outlet chambers and a grooved screw, *b*, or its equivalent, for regulating the area of the said passage.

136,747.—*Stone Pavement.*—ADOLPHE MACKERT, Guttenberg, N. J.

A pavement similar to the "Belgian" is made of ordinary cobble-stones by squaring the sides and top, leaving the bottom convex. The whole is rammed into a sand foundation.

Claim.—A pavement composed of blocks A of stone, being flat on their sides and upper surfaces, while their lower surfaces are convex or hemispherical, said blocks being set in a bed of sand and rammed down so as to cause the sand to wedge itself in between the adjoining blocks, substantially as shown and described.

136,748.—*Soldering-Machine.*—EDMUND MORRIS and WILLIAM H. KIMBALL, Burlington, N. J.; said KIMBALL assignor to said MORRIS.

The annular soldering-iron, adjusted to suit the size of the can-top, is provided with a disk, upon which is brought to bear the jet of gas and air.

Claim.—1. The annular soldering-iron V, in combination with a blow-pipe, substantially in the manner and for the purpose above described.

2. The combination of the collar H with the soldering-iron V and pipe S, when detachable from the pipe and soldering-iron, substantially as and for the purpose set forth.

136,749.—*Life-Preserving Mattress.*—HANNAH B. MOUNTAIN, New York, N. Y.

Claim.—The sack or receiving attachment B, united to the sections centrally, substantially as described, whereby the sections will assume and maintain horizontal positions by the weight of the occupant, and be reversible with the sack pendent therefrom, as described.

136,750.—*Sled.*—WILLIAM NEVERS, Bridgeton, Me.

Claim.—1. The spiked propelling-wheel C, with its operating-levers E, in combination with the frame or body A of the sled, substantially as described, whereby the forward end of the frame rests upon and is supported by the shaft of the wheel, for the purpose specified.

2. In combination with the sled-frame A the pivoted runners F, connected with the lever G by means of the links *f*, substantially as and for the purpose described.

136,751.—*Drain-Tile-Laying Apparatus.*—GEORGE W. NEVILL, Richmond, Va.

The tubes, connected by the pivoted straps, are entered into a row of tiles, and expanded by means of the screw, thereby expeditiously ranging them in line for laying and covering.

Claim.—A tool for placing tiles in a prepared ditch or excavation, consisting of tubes A B, connected by screw and pivoted straps as described.

136,752.—*Ditching-Machine.*—GEORGE W. NEVILL, Richmond, Va.

The swivel-caster and its connections facilitate turning the machine in a small space. The frame, pivoted at both ends, gives lateral and vertical adjustment; and the pivoted bar, working in a slot in the swiveled post, guards against torsional strains, while permitting free movement in other directions.

Claim.—1. The rear wheel D, placed in a swiveled and lock lever frame E, in combination with the rods F F pivoted to the axle and made to lock to the frame B or bracket f^4, as and for the purpose set forth.

2. The frame G pivoted at one end to the axis of the ditching-wheel C and at the other to the axle A, as and for the purpose described.

3. The bar H pivoted to the frame B and working in the slot of the swiveled post I, as and for the purpose described.

136,753.—*Apparatus for Cooling Air.*—PLACIDE NÉZEREAUX, Paris France.

A smooth copper plate, perforated with a number of small holes, is placed beneath the ice-chamber and receives the drip therefrom. Over this plate the drip-water spreads, forming a thin film, through which the air entering the ice-chamber is forced by bellows or other suitable means.

Claim.—The combination, in a refrigerating or cooling apparatus, of a horizontal perforated plate, a tube or passage for conducting air beneath the plate, and the devices described, or their equivalents, whereby a thin film of water is maintained on the plate, for the purpose specified.

136,754.—*Horse-Power.*—JOHN NICHOLS and EDMUND D. BROWN, Battle Creek, Mich.; said BROWN assignor to said NICHOLS.

Adjustable bearings for the spur wheel shafts, so that the meshes of the gears can be regulated at will.

Claim.—1. The bed-plate and top rim, (either or both,) provided with adjustable bearings or socket-plates for the spur-wheel shafts, substantially as and for the purpose set forth.

2. The adjustable bearing or socket plates for the spur-wheel shafts, in combination with slots in the rim and top plates, (either or both,) for permitting the adjustment of the spur-wheel shafts in radial lines, substantially as and for the purpose set forth.

3. The socket-plate B, provided with slotted bolt-holes in combination with the slotted bed-plate and bolts *b*, for adjusting the lower ends of the spur-wheel shafts, as described.

4. The flanged socket-pieces B' and set-screws b^3, for adjusting the upper ends of shafts C, as described.

5. The bed-rim and top-plate A A', provided with the ribs *d d*, in combination with the adjustable socket-plates, substantially as described.

136,755.—*Stove-Pipe.*—HENRY L. PALMER, New York, N. Y.

The pipe consists of two longitudinal sections. Each edge of one section is bent over outwardly, so as to form a bead. The

edges of the other section are bent first outwardly and then inwardly, thus forming a groove within which the bead on the edge of the other section is made to slide when the parts are brought together.

Claim.—A joint of stove-pipe constructed in sections *c* and *d*, and having beads or locks *a a* and *b b* fitted to slide into each other, for the purpose herein shown and described.

136,756.—*Railroad-Car Ventilator.*—DAVID W. NOYES, Bennington, Vt.

A hinged glazed sash projects from the window-casing. The sash is slotted above, below, and at each side to admit air.

Claim.—The hinged projecting window-sash D, having the ventilation-apertures *d'* at the sides, bottom, and top, substantially as specified.

136,757.—*Blank for Draw-Bolt.*—DAVID H. OLIVER, McClure township, Allegheny county, Pa.

The flat portion of the blank is wider than the shank, and forms the inside of the eye.

Claim.—A rolled blank for a draw-bolt having a flattened end, such flat being formed wholly or chiefly upon one side of and parallel to the axial line of the draw-bolt, substantially as described.

136,758.—*Car-Coupling.*—JOHN M. PERLEY, Cogan Station, Pa., assignor of one-half his right to JOSIAH BARTLETT, same place.

The stop falls over the head of the pin, which serves as a pivot for one of the hooks, and retains it (the pin) in place.

Claim.—The combination of the draw-head A, wings B B, p'ate C, pin *b*, button *d*, and hook D, all constructed and arranged substantially as and for the purposes herein set forth.

136,759.—*Car-Coupling.*—EDWIN F. PLANT, Burr Oak, Mich.

The link is attached to a pin in one bumper with its opposite end protruding outward, with the pin in position in the opposite bumper. When the cars are brought together, the bell-shaped mouth guides the link to the pin, and the sharp front side or edge of the pin enters between and separates the hooks of the link. As the points of the hooks pass the pin the spring-bar closes them together.

Claim.—1. The car-coupling link B, constructed of one piece of timber or metal, or of two pieces, rigidly united at their centers, and having spring-arms C and arrow-heads, substantially as specified.

2. In combination with the coupling-link B, the bell-mouthed bumper A and sword shaped pin *y*, constructed and arranged substantially as specified.

136,760.—*Cuff.*—ISAAC M. POST, Philadelphia, Pa.

A cuff made of wire-gauze, to be worn under ordinary cuffs as a support.

Claim.—The herein-described wire-gauze cuff, as a separate and distinct article of manufacture.

136,761.—*Wheel for Vehicles.*—JOHN J. RALYA, Cleveland, Ohio.

Claim.—1. The bearing-collars D, provided with the openings d and having their contiguous faces made concave, the spokes E provided with the grooves *e''* and made flaring at their edges and inner ends, and the keys F fitted into said openings *d* and grooves *e''*, when said parts are combined with each other, the thimble A, and suitable compressing devices, substantially as and for the purpose specified.

2. In combination with the bearing-collars D and spokes F provided with tenons *e'*, the lugs *d'* secured to or upon the inner portion and inner face of one of said collars and forming the mortises *d''*, substantially as and for the purpose shown.

3. In combination with the bearing-collars D and thimble A, the supporting-collars G fitted over said thimble, and the binding-nuts H fitted upon the same and having relatively right and left hand screw-threads, substantially as and for the purpose set forth.

4. The hereinbefore-described device as a whole, when constructed as shown and combined with the axle-arm, in the manner and for the purpose substantially as described.

136,762.—*Sewing-Machine Cover.*—CULLIN W. REED, Chagrin Falls, Ohio.

The folding cover formed by hinging its ends to the platform or bottom and the sides to the ends, which are separated at their center and fold down to form the table. The top of the sides project above the ends, and are constructed to fit the circular cap or cover, which, when closed, form a close cover for the machine. The circular cover when thrown back serves to reflect the light from a lamp by the aid of a reflector within the circle.

Claim.—1. A sewing-machine cover possessing two hinged end panels adapted to be turned upon the surface of the table in opposite directions, and provided with hinged or sectional side panels capable of being folded inwardly upon the end panels, as shown and described.

2. A sewing-machine cover comprising a hinged end section provided with rigid sides and cover, and a hinged end panel possessing folding side sections, as herein shown and described.

3. A sewing-machine cover provided with a reflector applied to its inner surface, as and for the purpose set forth.

136,763.—*Head-Lining for Barrels.*—GEORGE A. REED, New York, N. Y.

Short sections of hoops are put up in bundles, to be sold for the purpose of securing the heads in barrels.

Claim.—As a new article of manufacture, barrel-head linings, prepared in the manner specified, when bundled as shown and described.

136,764.—*Engine.*—THOMAS C. ROBINSON and CHARLES W. CLIFT, Mystic Bridge, Conn.

The reciprocation of the double-headed piston gives the initial movement to toggle-levers, one attached to oscillating valve provided with induction and eduction ports, the other to a piston forced down to complete their movement by pressure of water or steam admitted through suitable channel.

Claim.—1. The combination of the valve E, connecting-rod F, with the knuckle-joint *i* and piston D, substantially as shown and described.

2. The double piston-heads B B, main cylinder A, having the induction and eduction ports *f g*, with the valves *e e*, constructed to operate with valve E and piston D, substantially as and for the purposes set forth.

136,765.—*Process of Obtaining Gum Resembling India Rubber.*—ELBERT H. ROGERS, Tuscaloosa, assignor to himself and C. M. A. ROGERS, Gainesville, Ala.

The juice of the berries is expressed and separated from the hull by pressing, rolling, or pounding the fruit, which is subsequently washed and dried. It is then passed through a grinding-mill, which effectually destroys the cohesion of the hull, pulp, and seed, and allows them to be easily separated by means of a fan. The dry pulp being of less specific gravity than either the stones or skins, is blown out into a sheet or other receptacle prepared to receive it.

Claim.—The process of obtaining rubber-pulp from bamboo and other berries by first expressing the juice; secondly, drying the hull, pulp, and seed in a mass; thirdly, disintegrating said pulp, hull, and seed by trituration; and, finally, separating the pulp therefrom by a fan; all substantially as described.

136,766.—*Buckle for Harness.*—JEROME W. ROFF and RANSOM C. KIBBY, Elyria, Ohio.

A buckle device having side loops to which the breeching-stays are secured, and a holding-guide for the hip-straps.

Claim.—The breeching-stay fastening, having the side-projecting loops *g g* for the stays *h h*, and the continuous curved side plates *b e*, cap *a*, cross-bars *d d*, and projecting pin *c*, for fastening the short stays and the hip-strap, and to obtain the advantages herein set forth.

136,767.—*Bridle-Bit.*—BURDETT L. ROWLEY, New Britain, Conn.

The portion of the bit within the horse's mouth is composed of leather rings strung upon the metallic connection.

Claim.—A bridle-bit having the portion which is contained within the mouth of a horse covered with leather that is arranged with the edge of its grain to the wear upon said part, substantially as and for the purpose specified.

136,768.—*Device for Fastening Clothes-Lines, &c.*—ADAM E. SCHATZ, New York, N. Y.

A body in curved form, with two curves on one end with openings, one over the other, through which the line is passed and one end secured by a knot; the other passing through the upper opening, and through a slot in its other end, is held by a serrated cam pivoted to it.

Claim.—A line-holder composed of a body, A, of the construction herein described, and a serrated dog or cam-holder, B, combined and arranged substantially as and for the purpose herein set forth.

136,769.—*Stereotype-Plate Holder.*—WILLIAM SCHNAUFFER, Baltimore, Md.

A double block, each section provided with legs and one flange, so that a plate of unusual width may be supported thereon, and the space between them filled with leads.

Claim.—The two-part bed-block A' A', divided longitudinally through the middle, and each part having a dovetailed flange, *a*, and two legs, *a' a'' a' a''*, on each section, for the purpose set forth.

136,770.—*Preparation of Indigo for Dyeing and Printing.*—PAUL SCHUTZENBERGER and FELIX DE LALANDE, Paris, France.

The vessel is filled with zinc grains, shavings, or scraps so as to present a large surface, and a solution of bisulphite of soda added, after which the vessel is closed. The whole is kept at a medium temperature for about one hour, when the reaction is complete, giving "hydrosulphite of soda."

Claim.—1. The employment of the hydrosulphite of soda or its chemical equivalent in the reduction of the coloring matter of indigo, substantially as described.

2. The mode of treating or reducing indigo by means of the hydrosulphite of soda, or its chemical equivalent, in the presence of an alkali, substantially as described.

136,771.—*Shirt-Front.*—JEREMIAH A. SCRIVEN, New York, N. Y.

A stiffening is interposed between the bosom and lining, and is narrowed toward the waist to allow the bosom to freely bend at that part.

Claim.—As a new article of manufacture, the hereinbefore-described shirt-bosom A provided with a stiffening, C, reduced in width near its lower end, substantially as and for the purpose specified.

136,772.—*Base-Burning Stove.*—JOHN Q. C. SEARLE, Topeka, Kans.

The arrangement of the gas and air discharge exits around and above the mouth of the fuel-reservoir.

Claim.—1. A stove in which the gases generated in the magazine are discharged from a passage, *a'*, independent of the magazine, among the unignited mass of coal above the surface of the fire.

2. The combination, in a base-burning stove, of the air-chamber D, and an intervening independent gas-chamber, B, all arranged as described.

3. The combination, in a base-burning stove, of a flue or flues, H, connecting chambers at the top and base of the stove, and flues E communicating with the lower chamber and with the combustion-chamber, substantially as described.

4. The deflectors K, interposed between the descending draft-flues E and the walls of the air-chamber D, substantially as and for the purpose specified.

136,773.—*Railroad-Car Stove and Heater.*—JOHN Q. C. SEARLE, Topeka, Kans.

The products of combustion pass down one set of flues, around the fire-pot, and up another. The water is kept in motion by a rotary pump actuated by the car-wheel or suitable mechanism.

Claim.—1. The combination, with a water-reservoir surrounding a fire-pot, of flues D E extending through the said reservoir, and so arranged that the products of combustion shall pass down through one flue or set of flues and up through the other, substantially as described.

2. The combination, with a water-heating reservoir, and with a pipe or pipes communicating therewith, of a pump, or its equivalent, for creating and maintaining a determined circulation through the said reservoir and pipes.

3. The combination of the said pump, or its equivalent, with a railroad-car stove and a water-reservoir, and with devices for operating the pump.

136,774.—*Feed-Roller for Straw-Cutters.*—JOHN H. SHARP, Doylestown, Pa.

The upper of two rollers is held down by rods bent over its journals, these rods attached to horizontal arms having a segmental cogged connection centrally. A spring beneath this segmental connection preserves these arms horizontally, except when substances get between the rollers, when the upper is lifted an equal distance throughout its length.

Claim.—The combination, with rollers B and C, of the cogged arms or levers D D, spring E, and rods G G, connecting the arms with the journals of the upper roller, all substantially as and for the purposes herein set forth.

136,775.—*Grate Fire-Place and Hot-Air Furnace.*—JOHN H. SHERWOOD, New York, N. Y.

A flue from the hot-air furnace opens into a chamber behind and at the sides of the fire-place, and hence the twice-heated air is delivered into the apartment through registers in the chimney-front at the sides of the fire-place. Either furnace or fire-place can be used separately.

Claim.—The air-chamber C, forming a hot-air casing to the back sides and top of the grate fire-place A, in combination with the hot-air flue G of the furnace, the register or damper A, and the perforated distributers *g*, the whole constructed and arranged substantially as herein described, for the purpose set forth.

136,776.—*Railroad Switch.*—CHARLES S. SHUTE and LUCIEN R. SHUTE, Springfield, Mass.

The stops which protrude through the bed-plate are for locking the switch-rails in position, and are operated either by a foot-lever or by the wheels of the train through rods and levers. In the latter case the train approaching upon the main track would discharge the stop when holding the switch set for the siding, thereby permitting the switch-rails to jump into line through the agency of a spring. The switch is ordinarily operated by a hand-wheel, vertical rod, and cam.

Claim.—1. The bolt *c*, whereby the switch-rail is held secure in its position in connection with the main track, in combination with the pivoted lever M, rod M^1, and pivoted foot-piece *b*, whereby said bolt is operated, substantially as described.

2. The lever O, rod M^2, and foot-piece *a'*, in combination with the bolt *n*, whereby the switch-rails are released from their position in connection with the siding, substantially as described.

3. The piece *r*, rod P', pivoted lever P, and bolt *n* provided with a spring, C'', in combination with a spring, E, or its equivalent, whereby the switch-rails may be placed in connection with the main track automatically by an approaching train, substantially as herein set forth.

4. The combination of the shaft H' provided with the cam N, the switch-rod D provided with the projection *a*, and the spring E, or its equivalent, as a means of moving the switch-rails in both directions, substantially as herein described.

136,777.—*Saw-Set.*—AUGUSTUS B. SMITH, Chambersburg, Pa., and SAMUEL OSBORN, Trenton, N. J.

The anvil-block, slightly beveled toward the rear, is fixed in a frame between two projecting arms, connected by a cross-piece, that act, by raising or lowering them, as guides for the saw. A plunger, beveled to conform to the anvil and raised by a spring, bends the teeth.

Claim.—The construction and combination, jointly, of the stand A, die B, gage C, and plunger D, substantially as described.

136,778.—*Axle-Box for Vehicles.*—JAMES P. SMITH, Terre Haute, Ind.

Claim.—In combination with the axle-arm A and axle-skein D, the sleeve E provided with the slots *e* and containing the rollers F, substantially as and for the purpose specified.

136,779.—*Air-Ejector.*—JOHN Y. SMITH, Pittsburg, Pa.

To a disk at the rear end of the case is attached a series of tubes so arranged that as the disk is revolved they will successively register with an aperture in the cap of the case. Each of the tubes is filled with a slow-burning powder, and is supplied near its inner end with an ordinary cap-nipple for holding a fulminate. Within the case is arranged a gas-discharge nozzle, the outer end of which being smaller than the case leaves a chamber between the two, into which the air to be exhausted is drawn through a pipe. Upon exploding the cap the material in the tube will be ignited, the gas from which will pass through the aperture into the nozzle, and out through its contracted end with such rapidity as to exhaust the air from the chamber, and from any vessel to which the pipe leading from the chamber is connected.

Claim.—1. An air-ejector, combining in its construction a case for holding the parts in position, and for forming the outer shell of a vacuum-chamber, a nozzle for the passage of the gas, and one for the passage of the mingled currents of air and gas, a chamber or chambers for containing the material to be burned, and suitable mechanism for exploding a cap or fulminate, the parts being arranged substantially as and for the purpose set forth.

2. The disk E and tubes F, when combined with the case of an air-ejector, substantially as and for the purpose set forth.

136,780.—*Steam Air-Ejector.*—JOHN Y. SMITH, Pittsburg, Pa.

The angular portion of the case, against which the steam impinges when passing the end of the air-nozzle, is made of thin metal in order that the steam may be condensed, and aid in the production of a vacuum. In the chamber near the end where the air enters a valve is arranged to open inward, so that as steam is admitted to the instrument, and a vacuum is formed therein, the valve will open and permit the air to pass out of the pipes, but will close the instant the steam is shut off, and thus prevent the air from rushing in and destroying the vacuum.

Claim.—1. An air-ejector having the angular portion of its case against which the steam impinges when passing the end of the air-eduction nozzle made of thinner metal than its other portions, substantially as and for the purpose set forth.

2. The combination of the adjustable section A^3 of the outer case of the ejector with the stationary section A thereof and with the air-discharge nozzle A^1, the parts being arranged substantially as and for the purpose set forth.

3. The combination of a vacuum-valve with the air-eduction nozzle of an ejector, substantially as and for the purpose set forth.

4. An air-ejector combining in its construction an outer adjustable case, an interior air-discharge nozzle, a vacuum-valve, and a drip-valve for allowing the water of condensation to pass from the instrument, substantially as and for the purpose set forth.

136,781.—*Steam and Air Brake.*—JOHN Y. SMITH, Pittsburg, Pa.

The brakes are operated by adjustable levers and a vacuum-chamber, composed of a series of flexible diaphragms, to which the rods and levers are attached. By exhausting the air from the vacuum-chamber the atmosphere sets the brakes against the wheels.

Claim.—1. In an apparatus for connecting the brake-levers of cars, the flexible or expansible and contractible portion A and the rigid or non-expansible portions A^4 A^5, the parts being constructed and arranged substantially as and for the purpose specified.

2. The stops G and the adjustable levers B, in combination with the brake-levers D and rod F, whereby the relation of the brake-shoes with reference to the wheels may be adjusted, substantially as and for the purpose set forth.

3. The combination of a flexible vacuum-chamber with the brake-lever or levers of a car, when one end of such lever or levers is made adjustable, substantially as and for the purpose set forth.

4. The combination and arrangement of the adjustable levers B B and their connecting-rods with the mechanism for applying the brakes by hand, whereby additional leverage is obtained upon one end of the car, substantially as specified.

136,782.—*Lantern-Guard.*—THOMAS SMITH, Cleveland, Ohio.

Each upright consists of a half-round wire having eyes or indentations at suitable distances, bent and doubled to embrace the horizontal round wires of the guards.

Claim.—The ribs A, formed of half-round wire, and bent to form the eye B C, and used in connection with the circular braces D E, as and for the purpose set forth.

136,783.—*Summer Furnace.*—WILLIAM P. SPRINGER, Oswego, N. Y.

This device is set in the pot-hole of an ordinary cook-stove. The draft comes through the usual passages of the stove. The lower edge of the fire-pot curves inward so that the grate, which is supported thereon, may be tilted or turned, but cannot fall through the bottom.

Claim.—1. In combination with the lower end of the furnace H provided with the curved ledge A, the grate P having its lower edge rounded, substantially as and for the purpose shown.

2. The furnace H provided with the top plate I, the flue K, the exit-flue M and N, the grate P, and the boiler-holes Q and Q', when said parts are constructed and combined substantially as and for the purpose set forth.

136,784.—*Turbine Water-Wheel.*—STEPHEN M. STEVENS, Lancaster, Iowa, assignor of one-half his right to SAMUEL W. BEUAT, same place.

The buckets are made of steel, bent to the proper shape and clipped to form lugs, by which they are attached to the plate. The gates lie in a groove formed in the top plate and have an inclined beveled edge at the end, near the chutes, to keep mouths of the chutes clear of wood, sticks, &c., and to remove any ice that may form.

Claim.—1. The arrangement of the buckets having the clipped and bent lugs for securing them to the board and plate, and the

relation of the buckets to the board and to the plate *g*, as herein recited.

2. The inclined and beveled end gates, as described.

136,785.—*Horse Hay-Rake.*—STEPHEN STEVENSON, Dansville, N. Y.

Teeth, pivoted to and in rear of the axle, are dumped by means of brakes brought in contact with the tread of the supporting-wheels by a system of levers, the hand-lever of which is vertical to the plane of the others. Brake kept from contact by coiled springs.

Claim.—The levers H A^1, rack A, and connecting link and bar A^2 A^3, in combination with the revolving axle A', holding the arms D with brake-bar E' and brake-plate F, substantially as and for the purpose specified.

136,786.—*Loom-Picking Mechanism.*—ALBERT STOCKWELL, Woonsocket, R. I.

The actuating-lever of the picking mechanism is connected with the picking-sticks by means of straps and a segment lever upon a rock-shaft, and is actuated by a bumper on the end of the crank-arm on the upper shaft. The fulcrum is placed on a vertical slide, so reciprocated by a cam on the lower shaft as to bring a roller on the end of its short and curved arm within the path of the bumper at every alternate revolution of the shaft. To prevent the operative from introducing a shuttle into the box at the wrong time the picking-stick is held at the inner end of the box until the return of the shuttle by means of a second cam, so arranged on the lower shaft as to lift the lower and long arm of the actuating-lever at and for the time required.

Claim.—1. The combination, with the bunter *z* and bent lever F, of the slide *g* and cam *v*, substantially as specified.

2. The combination, with the bunter *z* and picking-lever F, of the holding-cam G, substantially as specified.

136,787.—*Washing-Machine.*—HENRY STUCKMAN, Bourbon township, Marshall county, Ind.

A tub lined with corrugated zinc, with timbers framed to form a cross suspended from a short shaft, to which is attached the driving-pinion. From the cross are framed timbers projecting downward, which may be adjusted to a smaller diameter by extra mortises. Attached to the rigid portion of the cover by pivot is a segmental driver, which connects with the pinion, to give motion to the machine by a lever extending from it.

Claim.—The tub A provided with the wringer-board *w* and corrugated wash-board M, in combination with the rack I operated by the pinion H, segmental cog E, and lever D, and provided with the dependent standards L and auxiliary adjusting-apertures *x'*, substantially as shown and described.

136,788.—*Wash-Bench for Wringing-Machines.*—JEROME B. SWEETLAND, Pontiac, Mich.

On the standard of a wash-bench is a bed-plate having flanges and guides, and above said bed-plate is a revolving plate, so that the wringer may be reversed in position. The revolving plate is held in position by spring-catches that engage in depressions in the bed-plate.

Claim.—1. The combination of the bed-plate H, having flanges *a a*, guides *b b*, and circle *d*, and the plate I with rim J, and apron K with flanges *e e*, all substantially as and for the purposes herein set forth.

2. The combination of the bed-plate H, revolving plate I, rim J, apron K, levers L L with pins *f f*, and the springs h h, constructed and arranged upon the standard of a wash-bench, all substantially as and for the purposes herein set forth.

136,789.—*Sash for Hot-Beds, &c.*—JOSIAH TAYLOR, Lock No. 4, Monongahela river, Pa.

Strips of rubber are inserted in grooves at the sides of the frame so that the edges of the glass press against them when constricted by the winding-rods and thumb nuts.

Claim.—In a sash for hot-beds or skylights, the combination and arrangement of the rails A B C, ends D, caps K, rods *g*, hook *i*, gum strips *e*, and glass *i*, all constructed and arranged with relation to each other as hereinbefore described, and for the purpose set forth.

136,790.—*Machine for Trimming Soles of Boots and Shoes.*—BENJAMIN J. TAYMAN, Philadelphia, Pa.

A combination of circular cutters for trimming the soles and welts of boots and shoes.

Claim.—1. In combination with the revolving shaft E, the cutters F and F^1 having the front edges of their teeth *i* inclined forward to the outer faces of the cutters to produce drawing cuts toward the middle of the edge of the sole, substantially as and for the purpose described.

2. The cutter F^2, in combination with the cutters F F^1, substantially as specified.

3. The gage O, in combination with the cutter F and loose guide N, substantially as and for the purpose set forth.

4. The rest P arranged and operating in relation to the cutters F, F^1, and F^2, substantially as and for the purpose specified.

136,791.—*Car-Axle.*—THEODORE R. TIMBY, Tarrytown, N. Y.

Claim.—A car-axle formed with one or more chambers within the journals, and extending inward, filled with water or other heat-conducting liquid and hermetically closed, as and for the objects specified.

136,792.—*Wax-Thread Sewing-Machine.*—ALEXANDER TITTMAN, Evansville, Ind.

The cam-block is attached to the awl-carrying bar; the curved arm at one end is connected with the shaft of the thread-guide, and the links are connected with rocking shafts having arms that operate the hooked needle and cast-off, and move the needle carriage laterally.

Claim.—The driving-shaft having the cams D^4 and D^5, and disk D with cam D^3 and pins *a d*, when combined with and operating the awl-carrier through the cam-block D^1, the thread-guide through the pivoted curved arm D^2, and the needle, and cast-off, and carriage, through the links M M and connecting mechanism, all substantially as and for the purpose specified.

136,793.—*Sash-Holder for Carriage-Windows.*—SILAS E. TOTTEN, Jr., New York, N. Y.

A segmental stop or sash-holder with curved edge and elastic pad is slotted nearly its entire length. A thumb or set screw, rising from a bracket on the sill of the carriage or other window, engages in this slot, and at the same time secures the stop in horizontal position. The device, when applied to the windows of a glass-front carriage, abuts against the sash to prevent shaking or rattling, and is released by the turning of the set-screw and lateral movement.

Claim.—The slotted segmental stop or fastener C, provided with an elastic pad, F, that abuts against the sash B, said stop working on a set or thumb screw, D, that rises from the bracket E, secured to the sill of the window-frame, substantially as and for the purpose described.

136,794.—*Slide-Rest for Lathes.*—CLAUS VAN HAAGEN, Philadelphia, Pa., assignor to himself and ANTHONY VAN HAAGEN, same place.

The slide is movable transversely on its base by a screw and nut. A block is swiveled on the slide and fastened by a follower and set-screw. A slide on the block is movable by a screw, and a slide on this latter slide is also movable by a screw. A screw imparts transverse motion to the whole device, or, when required, to one slide only, the latter being effected by locking screw and its nut together with a clutch. A nut turning with the screw imparts rotation through the bevel-wheel on its end, and other gearing to the motive-screw.

Claim.—1. The bed H carrying the slide I and admitting of being turned on the slide B, in combination with the mechanism described, or any equivalent to the same, whereby motion is communicated from the screw-shaft for operating the lower slide to the screw-shaft for controlling the upper slide, all substantially as set forth.

2. The sleeve b adapted to the slide B geared to the screw-shaft for controlling the upper slide I, and having an internal thread adapted to the screw for controlling the lower slide, in combination with the clutch *c*, or its equivalent, for throwing the said sleeve in and out of gear with the said screw-shaft D.

3. The duplex wheel F and its bearing E, composed of a severed ring fitted to an opening in the slide B, all as set forth.

4. The circular projection A of the bed H, adapted to a segmental shoulder, *i*, on the slide B, in combination with the follower *i'* and screw *j*.

136,795.—*Knob-Spindle.*—WALTER VARAH, New Haven, Conn.

A sleeve which fits the follower of a latch is arranged upon a round knob-spindle, and combined with a mechanism whereby the knob-spindle may be engaged with the said sleeve, so that turning the knob will turn the sleeve, or detached from the spindle so that the turning of the knob will have no effect upon the sleeve.

Claim.—The spindle D, made cylindrical at the central portion, combined with the square or angular sleeve I, latch *d*, and collar L, constructed and operating together substantially as and for the purpose described.

136,796.—*Eyelet for Harness-Traces.*—SAMUEL WALTERS, Dallas City, Ill.

A metallic eyelet is inserted in the slot in the end of a trace.

Claim.—The eyelet for harness-tugs, consisting of the slotted plate A, having the rim C raised from the inner edge of the elongated slot, and the flange B turned outward from the upper edge of the rim, substantially as specified.

136,797.—*Wrench.*—JAMES B. WEEDEN, Stafford, Conn., assignor to himself and MARCUS M. JOHNSON, same place.

Claim.—The combination of the lower jaw and handle, made in one piece with the upper jaw, and the nut fitted into the end of the handle, the whole constructed and designed to operate substantially as described, for the purpose set forth.

136,798.—*Sewing-Machine Table.*—JOHN J. WHEAT, Wheeling, W. Va.

The stationary top is recessed so as to allow the machine to drop below it. The machine is attached to a plate hinged to the top. A sliding top is arranged above the stationary top so as to cover the recess when the machine is lowered, or to form an extension of the table-top when the machine is raised for use. To the under side of the stationary top is attached a shield or protector to protect the machine from dust or injury when said machine is lowered.

Claim.—1. The combination, with a stationary sewing-machine table, recessed to allow the machine to drop below the sliding top B, constructed and operating substantially as set forth.

2. The sliding top B, combined with the frame C, when hinged to the main frame in such a manner that it will drop beneath and be covered by said sliding top, as set forth.

3. The shield E connected to the under side of the frame A, which, with the sliding top, protects the mechanism when the hinged frame is dropped beneath the main frame, as is herein set forth.

4. The combination of the frame A, sliding top B, hinged frame C, and shield E, constructed and arranged substantially as and for the purposes herein set forth.

136,799.—*Liquid-Meter.*—ALBERT M. WHITE, Bridgeport, Conn., assignor to THE FAIRCHILD WATER-METER COMPANY, New York, N. Y.

The wheel is suspended upon the upper end of an upright dead spindle around which it revolves. The dead spindle extends up through the center of the hub of the wheel, and through a sleeve attached thereto, and is constructed so as to form an oil-reservoir around the body of the dead spindle, whereby said sleeve has an elongated self-lubricating bearing. The oil is prevented from escaping at the lower end of the sleeve, and the propelling water or liquid restrained from passing up the sleeve by means of a fluid packing-cup.

Claim.—1. The fluid packing or quicksilver cup E, having an inner shell, F, in combination with the sleeve D of the wheel, the hollow hub A, the dead spindle C, and the oil-reservoir *c*, substantially as specified.

2. The combination of the cap G and nut *f* with the dead spindle C and collar *e* of the revolving sleeve D, whereby the wheel is wholly supported from above in both directions of its end thrust, essentially as described.

3. The oil reservoir or chamber *g* in the upper portion of the sleeve, in combination with the nut *f* and dead spindle C, substantially as specified.

136,800.—*Machine for Molding Panels.*—CHARLES H. WILLIAMSON and JOHN H. ALLEN, Whitestown, N. Y.

Devices are used on a bed of a planing-machine whereby square, oval, or round panels are molded by a pattern. Springs, one end of which are fastened to the bed and the other working on a screw-shaft attached to the sliding frames, afford uniform pressure of the gage against the edge of the pattern. Bars with stops and set-screws on the movable carriages limit the travel of the same.

Claim.—1. The springs T and V, substantially as and for the purpose hereinbefore set forth.

2. The combination of the rods M and P with the stops N and R with the adjustable stops O O O O and the adjustable stops S S S S, substantially as and for the purpose hereinbefore set forth.

3. The combination of the sliding head J, the grooved block L, the adjusting-screw K with the pitman and lever, substantially as and for the purpose hereinbefore set forth.

136,801.—*Transom Lifter and Lock.*—JOHN F. WOLLENSAK, Chicago, Ill.

The upright rod operating the arm which is attached to the transom is prolonged to some distance above the junction of the two and passed through a guide affixed to the wall. Thus a support is furnished the upper end and the ordinary bending and crooking of the rod is prevented. Directly beneath the point where the lifting-arm is joined to the upright rod is placed a roller, which, when the transom is heavy, sustains its weight and traverses the door-post.

Claim.—1. The roller R, arranged at the junction of the lifting-arm A and upright rod U, in a transom-lifter, substantially as and for the purpose described.

2. The guide G', arranged above the junction of the lifting-arm and upright rod, in combination with the prolonged rod U, the guide G, and arm A, substantially as and for the purpose specified.

136,802.—*Kitchen-Sink.*—FREDERICH WITTENBACH, Evansville, Ind.

The shifting sink is divided into compartments and is provided with a hand-grip and drain-pipes. In the act of drawing out the sink, the braces that are hinged to the closet are swung out and serve to support the sink.

Claim.—The combination of the shifting compartment sink E T, provided with hand-grip A and drain-pipes D D, with hinged brackets B B, and closet, all constructed and arranged as described.

REISSUE PATENTS.

5,316.—*Harvester.*—LINDLEY M. BATTY, Canton, Ohio, assignor to WILLIAM K. MILLER, same place.—Patent No. 111,424, dated January 31, 1871.

The main frame has a special construction to support and inclose the gearing. The double hinged coupling-frame, made of one piece bent into suitable shape, is adjustably hung between the driving-wheels and provided at its outer end with an auxiliary shoe. By detaching a pin the hinged finger-bar may be folded horizontally.

Claim.—1. The main frame, constructed as set forth, and consisting of the metal base-plate having the down-hanger cast at one end, the gear-chambers and casing at the side and near the outer corner thereof, and bearings for the journals, as described.

2. The combination of the driving-wheel hubs, notched intermittently to leave a bearing-surface on their interior, with the pawl-wheels fitting in said hubs, and carrying the spring-pawls taking into the ratchet-notches, as described.

3. The combination of the spring-pinion sliding on the counter-shaft, the swinging shipper, the lever pivoted on the box of the counter-shaft, and acting upon the swinging shipper, the link, the treadle and its spring, all these members being constructed and operating in combination, as set forth, to throw the mechanism out of gear whenever the driver releases the treadle.

4. The combination of the lifting-lever, its pawl, and the coiled-wire handle connected directly with the pawl, substantially as set forth, to enable the driver to release the pawl and move the handle by a single motion.

5. The combination, with the main frame, of the coupling-frame rocking on a longitudinal axis between the wheels, and pivoted to the main frame at one end by a swivel-joint and at the other by a sliding connection, these members being constructed and operating in combination, as and for the purposes set forth.

6. The coupling-frame, constructed as set forth, of a continuous bar, which also constitutes the guard-shoe.

7. The combination of the coupling-frame, the guard-shoe, the inner shoe of the finger-beam, the swivel-pin connecting the two shoes and the intermediate arm pivoted to the inner shoe and upon the coupling-frame, these members being constructed and operating substantially as set forth, to permit the folding of the finger-beam.

8. The combination, in a harvester, of a main frame, a hinged coupling-frame pivoted to said main frame, a guard-shoe attached to the coupling-frame, and a shoe carrying the inner end of the finger-beam pivoted to the coupling-frame, substantially as set forth, to allow the inner shoe to vibrate independently of the guard-shoe.

5,317.—*Stopper for Ingot-Mold.*—ALEXANDER LYMAN HOLLEY, Brooklyn, N. Y.—Patent No. 129,957, dated July 30, 1872.—Division A.

Claim.—1. The combination, with a bottom-casting ingot-mold, of a suitable device or devices capable of stopping off the mold at various heights, substantially as and for the purposes set forth.

2. A stopper for ingot-molds, supported at different heights by elastic flanges or friction-springs, substantially as herein described.

3. The flanged sheet-metal stopper F for stopping off ingot-molds at various heights, constructed and operating substantially as described.

4. The combination of an adjustable metallic stopper and a loam or sand filling, L, above the same, as herein set forth.

5. The combination of an adjustable metallic stopper, F, a loam or sand filling, L, and a supporting-plate, M, applied and secured substantially as illustrated.

5,318.—*Ingot-Mold.*—ALEXANDER LYMAN HOLLEY, Brooklyn, N. Y.—Patent No. 129,957, dated July 30, 1872.—Division B.

Claim.—1. The combination of a flask or distributer composed partly of loam or its equivalent and partly of iron with runners formed in the loam and cores to cover the runners, substantially as and for the purposes herein set forth.

2. A suspended cast-iron stopper for bottom-filled ingot-molds, substantially as herein described.

3. The suspending spring G, in combination with an ingot-mold, E, and a stopper, F, substantially as herein described, for the purpose set forth.

4. The adjustable corner-plates I, in combination with a stopper-supporting post, K, as and for the purpose herein set forth.

5. The supporting-post K with beveled top, in combination with the plates I, for the purpose specified.

5,319.—*Cotton-Press.*—MORAH M. JONES, Morrisville, N. Y.—Patent No. 28,281, dated May 15, 1860.

Claim.—1. The combination, with the follower of a press, of screws passing through nuts jointed to the follower, substantially as and for the purpose specified.

2. The combination, with the bed-piece of a press, of screws passing through nuts jointed to the bed-piece, substantially as and for the purpose described.

5,320.—*Steam-Gage.*—THOMAS WILSON LANE, Meredith, N. H.—Patent No. 23,032, dated February 22, 1859; extended seven years.

A double-branched Bourdon spring tube has its extremities joined to the index-lever at different points, so as to move in opposite directions as the two extremities diverge on expansion; the peculiarity being that the lever has no fixed pivot or attachment to the back of the case.

Claim.—The combination, with the two branches of the indicating-tube, secured in the gage in the manner herein described—that is to say, so that each branch shall not exceed a semicircle in length, the whole tube being placed in such position that it shall descend at every point toward and drain back into the pipe from the boiler—of a lever-transmitting the movement of the tube to an indicating mechanism, the lever being pivoted to the one branch and linked to the other by an arm jointed to the parts which it connects, without any attachment to the case or other rigid part of the gage, substantially as shown and set forth.

5,321.—*Chill for Casting Mold-Boards.*—JAMES OLIVER, South Bend, Ind.—Patent No. 86,579, dated February 2, 1869.

Claim.—The chill for casting mold-boards for plows, constructed to conform to the shape of the mold-board, and provided with seams or openings to allow the escape of steam and gas, substantially for the purposes herein set forth.

5,322.—*Machine for Dressing the Edges of Plate-Frames.*—JOHN W. SAYRE and ALEXANDER S. SHULL, Martin's Creek, Pa.; said SAYRE assignor of one-third, and said SHULL assignor of all his interest to HENRY W. HARPER.—Patent No. 50,170, dated September 26, 1865.

The slate-frame is placed in the holder, at the bottom of which revolve the cutters for dressing the corners. By a removal of the adjustable frame to the left the edges may be rounded by the same cutters.

Claim.—1. The combination, with a rotating cutter, J, of the frame T, which is arranged to receive a slate-frame, and which admits of being moved in a curved path, all substantially as set forth.

2. The said frame T, in combination with the clamp V or its equivalent.

5,323.—*Journal-Box.*—HARLOW H. THAYER, Sandwich, Mass., assignor of one-half interest to JAS. A. WOODBURY.—Patent No. 21,474, dated September 7, 1858; extended seven years.

A journal-box having a series of lubricating-chambers, each extending upward from the lower portion of the box containing lubricators, so arranged as to cause nearly the entire surface of the journal to be lubricated at each revolution. At each end of the lower portion of the box is a vertical chamber communicating freely with an oil-trough, and having a circular opening somewhat

greater in diameter than the journal in order to prevent oil from the journal running from the edge of the opening to the outside of the end of the lower part of the box. Immediately over each chamber the cap is grooved to intercept oil passing beyond the end of the outer bearing-surface, and also to conduct such oil into the chamber. Thus a constant circulation of oil is obtained between the trough and the journal while the latter is in rotation, and its whole surface is thoroughly lubricated at the same time.

Claim.—1. In a journal-box, the combination, substantially as described, of the lubricating-chamber *a* and bearing-surfaces *g* with the channel or trough *b* below the same.

2. The combination, substantially as described, of the intercepting-chamber *d* at each end of the box with the oil-trough *b*.

3. The openings *e* in the ends of the box made larger than the journal, as and for the purpose set forth.

4. The combination of the chamber *d* in the lower portion of the box with the groove *f* in the cap of the same.

5. The combination of inclined bearing-surfaces *g* with the inclined lubricating-chambers *a*.

5,324.—*Apparatus for the Manufacture of Illuminating-Gas.*—JOSEPH CARSON TIFFANY, Portsmouth, N. H.—Patent No. 133,391, dated November 26, 1872.

Claim.—1. A conducting or air-chamber, arranged within a gas-furnace at or near its top, created between the outside surface of the retort and a flanged ring forming a continuation of the wall of the inner furnace, whereby the heat is retained upon the retort and egress formed for the passage of the products of combustion around the upper portion of the retort, substantially as described.

2. In retort-furnaces, the combination of the grate ring B and the air-chamber ring H with the fire-chamber D and the retort K, substantially as described, for the purpose specified.

3. In a gas-furnace in which is employed a suspended retort, an adjustable top, J, having a depending flange for surrounding the outside shell of the furnace, for compensating for contraction and expansion.

4. The combination of the adjustable top J with the air-chamber ring H, substantially as described, for heating and supporting the retort.

5. Concentrating the heat of the inner furnace upon the retort, and protecting the outer shell from being destroyed by the heat of the inner furnace, by means of a non-conductor arranged on the inside or interposed between the fire-walls of the inner furnace and the outer shell of a gas-furnace.

6. A non-conductor interposed directly between the fire-walls of the inner furnace and the outer shell of a gas-furnace, for the purpose of concentrating the heat in the inner furnace upon the retort and protecting the outer shell from being destroyed by the intense heat of the inner furnace.

7. The combination and arrangement of the fire-chamber D, the non-conducting substance forming or interposed between the fire-chamber and the shell A, and the enveloping furnace-shell A, when constructed and arranged substantially as described.

INDEX OF INVENTIONS PATENTED MARCH 11, 1873.

[The numbers in parentheses denote the classification of patents.]

Air, apparatus for cooling, (83,) P. Neseraux 136,753
Air ejector, (12,) J. Y. Smith 136,779
Air ejector, steam, (12,) J. Y. Smith 136,780
Bag keeper, button hole cutter, and press board, carpet, (95,) S. M. Whitten 136,633
Bag tie, (57,) Benzahr and Rhodes 136,637
Barrel head lining, (40,) G. A. Reed 136,763
Barrel heading mechanism, (19,) J. Grifling 136,595
Bed bottom spring, (62,) Ogborn and Kendrick 136 665
Bed spring, (62,) Baker and Doney 136,692
Bee hive, (9,) Brubaker and Witmer 136,642
Belt, waist, (36,) Vogt and Dietzel 136,685
Bevel, carpenters', (97,) Fairbanks and Robinson 136,714
Bird cage, (178,) G. J. Manschauer 136,611
Bit, bridle, (72,) B. L. Rowley 136,767
Butter attachment, wash, (134,) N. C. Warner 136,686
Boilers, indicator and low water alarm for, (148,) M. Ellwood 136 646
Bolt blank, draw, (122,) D. B. Oliver 136,757
Boots and shoes, machine for trimming soles of, (16,) B. J. Taymon 136,790
Boring tool, expanding, (100,) J. C. Kacerovsky 136,736
Broom, (22,) C. Beeckh 136,684
Brush ferrule, (32,) W. F. Lorey 136,605
Buckle, harness, (93,) Ropp and Kibby 136,766
Bung bush, (40,) O. P. and L. W. Briggs 136,696
Burner, lamp, (30,) B. F. Chappell 136,596
Butter bucket, (45,) J. F. Dumont 136 713
Button, clasp, (62,) A. Flatley 136,648
Camphor, preparing, (35,) W. P. Stines 136,623
Can and torch combined, oil, (90,) W. Kelly 136,738
Car axle, (122,) T. R. Timby 136,791
Car brake, (122,) Brown and Pegram 136,581
Car check for railway rails, (190,) W. O. Stephenson 136,625
Car coupler, (122,) W. D. Tisdale 136,627
Car coupling, (122,) L. L. Bond 136,640
Car coupling, (122,) A. K. Kline 136 655
Car coupling, (122,) J. Moulton 136,610
Car coupling, (122,) J. M. Phelps 136,758
Car coupling, (122) E. F. Plant 136,759
Car, hand, (122,) D. M. Hunt 136 652
Car ventilator, railway, (166,) D. W. Noyes 136,756
Carriage axles, machine for rolling, (60,) J. C. Richardson. 136,620
Carriage, baby, (31,) S. Molatire 136,607
Carriage windows, sash holder for, (24) S. E. Totten, Jr . 136,793
Chain link, ornamental, (96,) J. J. Freeman 136,594
Chair foot rest, (62,) T. A. Johnson 136,734
Cigar mold, (160,) C. H. Palmer 136,615
Cloth cutting machine, (36,) J. Kent 136,602
Clothes line fastener, (91,) A. E. Schatz 136,768
Clothes line pole, (91,) C. B. Brown 136,641
Coal mining machine, (124,) C. L. Driesslein 136,712
Coke from lignite, process of making, (61,) H. Engelmann. 136,592
Colter, (114,) R. Emerson 136,647
Comminating various substances, apparatus for, (3,) G. B. Canning 136,703
Cooler, milk, (45,) W. O. Campbell 136,584
Cooler, water and beer, (13,) C. Hubing 136,600
Cooler, wine, (58,) J. R. Whipple 136,632
Couch, accouchment, (62,) E. L. Moore 136,663
Cuff, (36,) I. M. Post 136,760
Cultivator, (43,) W. P. Dale 136,708
Curl, artificial, (161,) J. Graham 136,730
Ditching machine, (114,) G. W. Nevill 136,752
Door check, (24,) G. C. Idly 136,731
Drain, sediment, (8,) G. R. Moore 136,606
Drain tile laying apparatus, (114,) G. W. Nevill 136,751
Drip collecting device, (57,) W. A. Harris 136,597
Dumping scow, (62,) J. E. Bartlett 136,578
Elevator, (79,) J. M. Bean 136,580
Engine, (150,) Robinson and Cliff 136,764
Fence, portable, (52) D. S. Watts 136,630
Fence, wood, (52,) D. G. Temple 136,679
Fire arms, magazine, (18,) G. D. Luce 136,669
Fire proof building block, (153) Van Zandt and Tartiere. 136,684
Fruit drier, (48,) J. L. Post 136,670
Furnace for heating iron bars, &c., (99,) J. Pardee 136,667
Furnace grate, (149,) H. Ryder 136,673
Furnace, summer, (154,) W. P. Springer 136,783
Garter, (38,) H. A. House 136,599
Gas, apparatus for the manufacture of illuminating, (66,) J. C. Tiffany, (reissue) 5,324
Gas lighting apparatus, automatic, (90,) F. Korwan 136,739
Generator, steam, (148,) Babcock and Wilcox 136,691
Grain measure and register, (42,) R. B. Clark 136,643
Grate fire place and hot air furnace, (154,) J. H. Sherwood. 136,775
Gum resembling India rubber, process of obtaining, (64,) E. H. Rogers 136,765
Harness trace eyelet, (23,) S. Walters 136,796
Harrow, (73) L. C. Gifford 136,717
Harvester, (74,) L. M. Batty, (reissue) 5,316
Harvester, (74,) J. S. Truxell 136,628
Hat and parcel holder, (169,) A. Clarke 136,587
Hinge, wrought iron blind, (24,) W. R. Goodrich 136,650
Hoe, (141) M. Johnson 136,733
Hoe plates, die for forging, (141,) L. T. Richardson 136,672
Hoisting apparatus for mines, swivel, (79,) T. M. Martin. 136,461
Hoof spreader, (60,) T. Armstrong 136,589
Hook, safety pocket, (38) Malmström and Dummer 136,742
Hook, snap, (53,) G. M. Hubbard 136,728
Horse power, (139,) Nichols and Brown 136,754
Hose bridge, (130,) J. E. McCanliay 136,745
Hose port hole for partition walls, (167,) H. Woodman 136,687
Houses, construction of, (30,) O. C. Campbell 136,583
Ice tongs, (58,) W. T. Farre 136,593
Implement, compound, (16,) A. Ike 136,601
Indigo for dyeing and printing, preparation of, (11,) Schutzenberger and De Lalande 136,770
Ingot mold, (33,) A. L. Holly, (reissue) 5,318
Ingot mold stopper, (33,) A. L. Holly, (reissue) 5,317
Journal box, (87,) H. H. Thayer, (reissue) 5 322
Knife scourer, (88,) E. W. Haven 136,568
Knit fabrics and method of knitting them, (89,) D. Bickford 136,639
Ladder, step, (29,) M. N. Lovell 136,659
Lamp chimney cleaner, (90,) Chollar and Johannes 136,704
Lantern guard, (90) T. Smith 136,782
Latch and lock combined, (93) A. J. Hollemback 136,723
Lathe rest, (100,) C. A. Bauer 136,579
Lathe slide rest, (100,) C. Van Haagen 136,794
Letter sheet and envelope combined, (146,) T. Orton 136,666
Liquid meter, (167,) A. M. White 136,799
Lock, combination, (93,) W. C. McGill 136,606
Locomotive, (94, W. S. Hudson 136,729
Locomotive cylinder cock, (94,) C. H. Hopkins 136,721
Locomotive exhaust nozzle, (94,) G. W. Richardson 136,619
Locomotive relief valve, (94,) G. W. Richardson 136,618
Loom picking mechanism, (95,) A. Stockwell 136,796
Loom shuttle, (95,) D. C. G. Field 136,415
Loom temple, (95,) F. J. Dutcher 136,644
Mattress, life preserving, (138,) H. B. Mountain 136,749
Meat chopping machine, (25,) G. Spichlman 136,624
Medical compound, (98,) H. Themel 136,680
Medical compound and medicated food, (98,) J. M. O. Tamin 136,678
Metallic bands, machine for rerolling, (125,) C. W. Chapman 136,585
Mold boards, chill for casting, (33) J. Oliver, (reissue) ... 5,321
Molding plastic articles, composition for, (33,) C. Legg ... 136,658
Motion of a shaft into reciprocating motion, converting rotary, (67,) J. B. Sizer 136,675
Nickel plating, (113,) L Adams, Jr 136,634
Organ, reed, (106,) E. Oakes 136,614
Organ stops, operating, (106,) H. R. Moore 136,664
Oysters, vessel for steaming, (88,) C. S. Collins 136,588
Oyster winder, (143,) W. C. Kanne 136,737
Pan, stew, (154,) G. W. Griswold 136,596
Panels, machine for molding, (173,) Williamson and Allyn. 136,800
Paper feeding machine, (117,) M. Piedra 136,668
Pavement, stone, (110,) A. Meckert 136,747
Pegging machine, (16,) G. W. Manson 136,743
Pencil sharpener, (146,) E. M. Crandall 136,590
Pine leaves for use in the arts, treating, (34,) C. E. Ramus. 136,671
Pipe fittings, machine for tapping, (64,) E. Rogers 136,621
Pitman, (67,) H. Aufdembrinke 136,690
Planter, hand, (133,) R. Arey 136,688

Pot, coffee, (88,) H. J. Childs 136,703
Press, cotton, (7,) J. M. Brooks 136,697
Press, cotton, (7,) C. C. Howard 136,725
Press, cotton, (7,) M. M. Jones, (reissue) 5,319
Press, oil, (36,) W. M. Force 136,716
Pulleys, lubrication of clutch, (87,) Canis and Higgins 136,699
Railway brake, hydraulic, (122,) G. P. Renshaw 136,617
Railway rail joint fastening, (120,) S. Vanstone 136,683
Railway snow plow, (122,) T. A. Davies 136,709
Railway switch, (120,) C. S and L. R. Shute 136,776
Rake, horse hay, (77,) S. Stevenson 136,785
Refrigerator door, (58,) P. A. Vogt 136,629
Register, hot air, (154,) E. A. Tuttle 136,682
Rocking horse and swing combined, (143,) Crandall and Twiddy 136,707
Roofing, composite, (126,) S. C. Hogue 136,722
Sad iron, (91,) F. Myers 136,612
Sad and embossing iron combined, (91,) F. Myers 136,613
Sample fastener, (54,) C. Mason 136,602
Sand, &c., apparatus for crushing, grinding, and mixing molding, (33,) J. O. Heuctin 136,721
Sash holder, (24,) H. Thomas 136,681
Sash for hot beds, &c., (63,) J. Taylor 136,789
Saw mills, head block for, (130,) D. Lane 136,656
Saw mills, head block for, (130,) D. Lane 136,657
Saw set, (131,) Smith and Osborn 136,777
Screener and commode, ash, (8) J. C. Morrell 136,609
Sewing machine, (134,) E. A. Goodes 136,718
Sewing machine, (134,) W. C. Pickersgill 136,616
Sewing machine attachment, (134,) J. M. Griest 136,651
Sewing machine clamp, button hole, (134,) W. Chicken ... 136,702
Sewing machine cover, (134,) C. W. Reed 136,762
Sewing machine rotating hook, (134,) A. and J. Aird 136,635
Sewing machine ruffling attachment, (134,) E. Stewart 136,676
Sewing machine table, (134,) J. W. Cheney 136,701
Sewing machine table, (134,) J. J. Wheat 136,798
Sewing machine tension indicator, (134,) D. B. Tiffany 136,626
Sewing machine treadles, foot warming attachment for, (134,) A. R. Bush 136,583
Sewing machine, wax thread (134,) A. Tittman 136,792
Shirt front, (38,) J. A. Scriven 136,771
Shoe fastening, (16,) C. Goldthwait 136,649
Sign, (54,) E. M. May 136,744
Sink, kitchen, (98,) F. Wyttenbach 136,803
Skate, roller, (143,) O. H. Dodge 136,711
Slate, (146,) C. Draeger 136,501
Slate frames, machine for dressing the edges of, (146,) Sayre and Shull, (reissue) 5 322
Sled, (31,) W. Nevers 136,750
Smoking tube, (160,) A. Brear 136,695
Soldering machine, (136,) Morris and Kimball 136,748
Sole buffing machine, cylinder for, (16,) J. Howe 136,727
Sole pressing machine, (16,) F. W. Coy 136,706
Spindle, knob, (93,) W. Varah 136,795
Spinning ring traveler, (142,) J. Goulding 136,719
Square attachment, carpenters', (29,) J. Hyman 136,653
Stamp, branding, (16,) J. W. Dodge 136,710
Steam and air brake, (122,) J. Y. Smith 136,781
Steam gage, (148,) T. W. Lane, (reissue) 5,320
Steam power brake coupling, (67,) G. Westinghouse, Jr.. 136,631
Stereotype plate holder, (117,) W. Schnauffer 136,769
Stone, artificial, (153,) R. Lemare 136,604
Stove and heater, railway car, (154) J. Q. C. Searle 136,773
Stove, base burning, (154,) J. Q. C. Searle 136,772
Stove pipe, (154,) H. L. Palmer 136,755
Stove platform, (154,) W. M. Conger 136,589
Stove, reservoir cooking, (154,) J. R. Hyde 136,730
Straw cutter feed roller, (59,) J. H. Sharp 136,774
Table, extension, (62,) M. Coleman 136,705
Tool, combined (39,) W. Bartle 136,693
Toy puzzle, (143,) B. F. Ellis 136,645
Transom lifter and lock, (24,) J. F. Wollensak 136,801
Treadle, (67,) G. B. Kirkham 136,603
Truss pad, (156,) N. Jones 136,735
Tube forming die, (163,) J. Kintz 136,654
Vehicle axle box, (31,) J. P. Smith 136,778
Vehicle wheel, (31,) H. Pitcher 136,669
Vehicle wheel, (31,) J. J. Ralya 136,761
Valve and trap, combined globe, (152,) H. J. McMahon .. 136,746
Valve, rotary balanced cut off, (153,) Shellenback and Brillmayer 136,622
Wagons, apparatus for hoisting and dumping loaded, (79,) W. J. Brown 136,698
Washing machine, (91,) H. Stuckman 136,787
Water proof furse fabric, (37,) S. H. Atkins 136,636
Water wheel, turbine, (168,) S. M. Stevens 136,784
Wheel, traction, (67,) J. V. Strait 136,677
Whip socket, (72,) G. H. Jewett 136,738
Window sash ventilator, (166,) J. C. Bates 136,636
Window screen, (30,) S. T. Lippincott 136,740
Wines and liquors, aging, (19,) A. Luquet 136,741
Wrench, (100,) J. B. Weeden 136,797
Wringing machine, wash bench for, (91,) J. B. Sweetland. 136,788

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 11, 1873.

Adams, F. F., assignee 136,639
Adams, I. Jr., Nickel plating 136,634
Aird, A. and J., Sewing machine rotating hook 136,635

COMMISSIONER'S DECISIONS.

J. W. WATTLES.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Joseph W. Wattles for letters patent for* IMPROVEMENT IN SUSPENDER-STRAPS.—*Decided March* 22, 1873.]

AMENDMENTS DURING PENDENCY OF APPLICATION—ARTICLES OF MANUFACTURE—NOVELTY.

An amendment should not be received which introduces into the application a feature not described in the specification as originally filed, and which has not been sworn to by the inventor.

There is no novelty in making a suspender-strap by uniting several layers of a fabric which is well known although it has never been used for that purpose before, if such straps have been previously made from other similar fabrics in the same way.

To claim a production as "a new article of manufacture" does not entitle it to a more favorable consideration.

In order to render an article of manufacture patentable it should require invention to produce it just as much as a machine.

If any one has the right to use a certain fabric he is not to be restricted in his right by a patent for employing the fabric in a way which did not require invention.

LEGGETT, *Commissioner:*

The alleged invention in this case is set forth in the claim, as follows:

"I therefore claim, as an improved article of manufacture, a suspender-strap as composed of two or more layers of elastic warp knit fabric, cemented together and united by a strengthening thread or wire sewed or stitched through the layers, as described."

An examination of this case shows a little irregularity of practice upon the part of the Examiner. As the case was originally filed no allusion was made to the use of cement in making the straps, yet an amendment prepared by the attorney, embracing this element, not sworn to by the applicant, was afterward admitted by the Examiner into the body of the specification and also in the claim.

The Examiner, however, seems to have made no objection as to the amendment with respect to this matter, but has examined the case and rejected it upon its merits as if properly filed and amended. The references show that a patent was issued to Charles Benedict, October 23, 1852, for suspender-straps made of two layers of felt; to J. Flagg, April 27, 1869, for straps made of felt and leather combined; to the same party, September 14, 1869, for straps made of two layers of cloth or leather and one sheet of metal interposed; and one to Joseph W. Wattles, the present applicant, December 6, 1870, for straps where one or both faces are made of woven cloth and the center of leather. Reference is also made to a rejected application of Henry Heath, filed April 14, 1870, for straps made of canvas lined with muslin, and to several other similar devices for the same purpose.

In most, if not all of these references, the layers are fastened together by stitching or cement, or both, substantially in the same manner as described by applicant.

The only novelty applicant claims in his reasons for appeal is in the use of two or more layers of "elastic warp knit fabric," none of the others specifying this particular material. If the applicant was the inventor of this special fabric, there is no doubt but that he would be entitled to his claim. But the fabric is old, and the only special quality of merit claimed for this strap is to be found in the quality of the material used.

I cannot see, therefore, that the applicant has in this case presented anything to which he is entitled. Whoever has the right to the use of the fabric he names certainly should not be prevented from using it in the construction of an article of dress so old and so common as that of suspenders; and as he shows nothing new in the mode of constructing the straps there is nothing new in the suspender when constructed with this material that should entitle him to a monopoly.

The applicant seems to suppose that by claiming the strap manufactured of this material as a "new article

of manufacture" he will be entitled to a patent without showing that in its production he has exhibited invention.

I do not understand that a "new article of manufacture" is to be granted the protection of a patent without invention any more than a machine. In the production of a new article of manufacture there must be some obstacle to overcome, some new result to be attained that calls into action the inventive faculty. The mere substitution of one well-known material for others so similar as to be distinguishable only by expert examination, in the construction of a well-known article, is the furthest thing possible from invention.

BEHR & MONGEL, ADM.—*Extension.*

[*In the matter of the application of Julia Behr, administratrix, and H. C. Mongels, administrator, of the estate of Edward Behr, deceased, for extension of patent No. 23,344, for* IMPROVEMENT IN SKATE-FASTENINGS, *granted March 29, 1859, and reissued August 2, 1870.—Decided March 28, 1873.*]

EVIDENCE AS TO DILIGENCE AND REMUNERATION—VALUE—INTEREST.

The extension of a patent refused because the application was sustained only by the affidavits of the petitioners, and also because the invention was never in extensive use, and the demand for it had ceased.

It is a grave objection to the extension of a patent if an interest in it has been assigned upon the purchaser's agreeing to employ counsel, and, if it can be made to cover subsequent improvements, to take measures for that purpose.

LEGGETT, *Commissioner:*

This application is only supported by the affidavits of the administrator and administratrix accompanying their statement and account. It is possible that an extension might properly be granted upon no more proof than this, if the invention upon examination should be found to have constituted a decided advance step in the art to which it pertained and had not been superseded by other inventions of more importance not resting upon it as a foundation. But in this case it appears that this skate-fastening never did go into public use to any considerable extent, and that now it has become wholly obsolete, so far as any demand in the market is concerned. It is set forth that one-half of the interest in the extended term, if granted, will be in a Mr. Ladd, who has agreed "to secure able counsel to consider the relation of this patent to the later improvements, and, if just, to secure a proper royalty, to be equally divided between him and ourselves after the expenses are paid."

This exhibits a scheme to subordinate and control the improvements of subsequent inventors, if "able counsel" think there is a prospect that the reissue will serve such a purpose. This makes a rather remote contingency upon which to base either an expectation of reward to the representatives of the inventor, or an estimate of the value and importance of the invention to the public. In fact, it is a somewhat singular proposition. An extension of a patent is asked upon a promise to ascertain if it is not possible to torture the patent into shape to mulct subsequent inventors and the public by means of it.

This is not what is contemplated by the law providing for the grant of extensions. There appears to be no ground whatever to warrant the grant, and the extension is refused.

HENRY R. ROBBINS.—*Extension.*

[*In the matter of the application of Henry R. Robbins for the extension of letters patent for* "IMPROVEMENT IN FIRE-PLACE HEATING-STOVES," *granted March 29, 1859, and reissued Nov. 12, 1872.—Decided March 21, 1873.*]

EVIDENCE OF DILIGENCE.

Although the evidence does not give all the information as to the value of the invention and the diligence of the patentee which the rules require, yet if it gives enough to satisfy the Commissioner, and there is no serious opposition on that point, the patent will be extended.

If there is a reasonable doubt whether one of the claims in a patent is anticipated in an old unexplained drawing, it should not prevent the extending of the patent.

Although one of the claims in a patent seems to be invalid, yet if it has been embraced in a subsequent patent granted to other parties, and there are other claims for a valuable invention, the patent will be extended.

If a device which has been used before in a stove can be applied to one of another kind without difficulty, a claim for the new application should receive no countenance.

It would seem that the merit of novelty should not be denied to a device upon reference to a mere drawing not accompanied by any explanation.

It is questionable whether merely advancing the fire-pot of a stove farther into a room in order to heat it more effectually should be regarded as an invention.

THACHER, *Acting Commissioner:*

The application in this case is not satisfactorily supported. Besides certain certificates, which cannot be received as evidence, there have been filed only four short affidavits, which do not furnish all the information required by official rules, and do not substantiate all the averments of the sworn statement. Nevertheless I am not disposed to regard these defects as fatal, for the evidence does, to some extent, inform the Commissioner as to the value and importance of the invention and the reasons why the inventor has failed to receive reasonable rémuneration.

There is no serious opposition to the extension on this account, but the real point of attack is the second claim of the reissued patent, which is as follows:

"A fire-place stove having a portion of the cylinder or fire-pot projecting into the room, substantially as and for the purpose described."

It is asserted that this claim is wanting in novelty, and a number of references were cited at the hearing to prove the declaration. All of these which really have pertinence are considered in the report of the Examiner, who reaches the conclusion, after a somewhat elaborate discussion, that the novelty of the invention is unimpeached. I have studied the cases carefully, and believe none of them demand special notice, except the old patent granted to E. Nott, October 25, 1832. The restored drawings illustrating Nott's invention are very voluminous, but only Fig. 20 is supposed to show an arrangement of parts like that claimed by Robbins. The title of the patent is "Improvement in the adaptation of the anthracite-coal stove to open fire-places," and, if I was satisfied beyond doubt that the figure in question represents the stove placed in a fire-place and having the combustion-chamber projecting into the room, I should hold the second claim of the Robbins patent to be completely answered, for I do not think the point well taken that the reference, to be valid, must show what is known as the "Baltimore heater," as there is no apparent obstacle to the application of the arrangement, supposed to be shown by Nott, to the cylinder stove known as the "Latrobe."

The drawing is the only evidence of such an arrangement of the stove. There is not one word in the patent relating to the position of the stove with reference to the fire-place and room; it is all a matter of inference from the drawings. The title of the patent and the relative arrangement of the grate, combustion-chamber, upper damper, and what is supposed to be the face-plate, give color to the inference, and lead me to believe that it is substantially correct. Yet I cannot say that this is a matter about which there can be no *reasonable* doubt. In the absence of all verbal description, the assertion either that the heater was not set out in the room like an ordinary stove, or wholly within the fire-place like the old "Latrobe," would be unwarranted. The sufficiency of references of this description to defeat a patent has been seriously questioned. *Seymour* vs. *Osborne*, 11 Wallace, 516; *Reeves* vs. *Keystone Bridge Co.*, Off. Gaz., vol. 1, 466. On the authority of these cases it is only necessary to repeat what has been said already in a former extension case—that to impeach the novelty of an invention the reference must be a matter of certainty, not of inference. A. C. Herron, Off. Gaz., vol. 1, 608. In view of these decisions the objection to the second claim for want of novelty in the invention must fail.

An objection much more serious, though not heretofore raised in the case, it seems to me would lie to the patentability of the subject-matter of this claim. There appears to have been no hindrance to the advancement of the stove further into the room, and the effect of this projection is just what would be expected by any one familiar with even the elementary laws of heat. I am at a loss, therefore, to know where the evidence of invention is to be found, or on what ground the claim was allowed. If it was the only claim in the patent I should have little hesitation in refusing an extension. But the other claims are unobjectionable and evidently valuable. The patent is a leading one, and undoubtedly will be litigated. Furthermore, it appears that in the reissue, obtained June 11, 1872, of a patent granted to Bibb and Augee in 1861, the same claim in substance was allowed; so that, if the claim in question should be disclaimed by Robbins before extension, its spirit would stil exist in the Bibb and Augee patent to plague the manufacturers and users of modern "Latrobe stoves." If this claim can be sustained it belongs to Robbins, whose patent antedates that of Bibb and Augee a little more than three years. It would be a great hardship, then, to compel him to strike it from his patent, thereby leaving him, with others, subject to the annoyance which might arise in the manufacture of his own stove by reason of a claim inadvertently granted to subsequent inventors.

Under these circumstances I believe the rights of all parties interested will be promoted by permitting the claim to remain in the patent, in order that the whole question may go to the courts for final adjudication.

The extension will be granted on the payment of the usual fee before the expiration of the original term.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF NEW JERSEY.

E. S. EMERSON *et al. vs.* EDWARD SIMM *et al.*

In Equity.—Before Nixon, Judge.—Decision rendered February 20, 1873.]

MEASURE OF DAMAGES—EXEMPLARY DAMAGES—RIGHTS OF DEFENDANT UNDER A DECREE FOR DAMAGES.

In a suit in equity for the infringement of a patent it is not necessary that damages be prayed for *eo nomine*. Under the general prayer of the bill for such relief as may be agreeable to equity the complainants become entitled to damages upon a decree being rendered in their favor.

Where the defendants purchased the infringing machine in the open market, without knowledge of the patent, and abandoned all the patented appliances on being notified of their infringement: *Held*, that it was not a case for exemplary damages.

If the owner of a patent has an established license fee for persons doing the class of business in which the defendants were engaged, the amount of such fee is his loss or damage for the use of the invention by them without a license.

Under such circumstances, the fact that defendants discontinued the use of the infringing machine when notified of the infringement, and that they might have used some other machine as advantageously, has no weight in measuring the complainants' damages.

But a decree for damages, where the complainants have an established license fee, for the amount of such fee, gives the defendants the right to use the invention during the life of the patent.

This was a suit in equity under letters patent granted to Robert G. Emerson and John Myers, under date of May 23, 1854, for an improved sawing-machine.

It appeared that the defendants, without knowledge of the patent, had purchased a single machine which was acknowledged to be an infringement of complainants' patent; and, further, that when they were notified that they were infringing they promptly abandoned the use of all the devices protected by the patent. It also appeared that the complainants had an established license fee for persons of the class of the defendants for using machines made under the patent.

The case came up upon exceptions to the master's report, to whom it had been referred to state an account of the profits received by the defendants and to assess the damages suffered by the plaintiffs.

[*F. H. Betts*, for complainants.

S. J. Glassey, for defendants.]

NIXON, *Judge:*

The bill of complaint in this case prays "that the defendants may be compelled to account for and pay over unto the plaintiffs all such gains and profits as have accrued or arisen to, or been earned and received by, the defendants, and all such gains and profits as they would have received but for the wrongful acts of the defendants, and such other relief as the equity of the case may require."

The bill was taken, as confessed, for want of an answer, and a final decree entered May 9, 1872, with a reference to a master to take and state an account of the profits accrued to or received by the defendants on account of their infringement, and also to assess the damages suffered by the plaintiffs from such infringement.

The master's report was filed November 22, 1872, finding—

1. That no satisfactory proof was made before him that the defendants had derived or received any profit from the use of the plaintiffs' invention; and

2. That the plaintiffs had suffered damage by the infringement of their patent right by defendants to amount of $1,200, arising from their loss of the license fee, as established by the complainants for the use of their invention and machine by persons engaged in business of the character carried on by the defendants.

Six exceptions are filed to the report in behalf of the defendants, all of which, I think, are embraced in these two:

1. Because the master reports that the complainants are entitled to any damages in this suit.'

2. Because he reports that they should be awarded the sum of $1,200 as a license fee for damages for the infringement; or that the evidence in the case warranted the finding of any such sum as the value of a license for complainants' invention.

1. The first exception was not very seriously urged at the argument.

The bill in this case was filed June 14, 1871. The 55th section of the act of July 8, 1870, supplementing the provisions of the patent act of 1836, provides that, "upon a decree being rendered in any case for an infringement, the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby, and the court shall assess the same, or cause the same to be assessed under its direction, and shall have the same powers to increase the same in its discretion that are given by said act to increase the damages found by verdicts in actions upon the case."

It will be perceived that the above section materially changes and adds to the remedy given to plaintiffs under the act of July 4, 1836.

The 14th section of that act confined the jury to the *actual* damages which had been sustained by the plaintiff; and this amount the court was authorized to increase to any sum not exceeding three times the amount of the verdict.

The objection of the defendants in this case is, that the bill of complaint does not pray for damages *eo nomine*, and, hence, that no damages should be allowed.

The answer is, that the bill asks for an account of gains and profits, and such other relief as may be agreeable to equity, and that under this general prayer for relief, upon a decree being rendered in favor of the complainants for an infringement of their patent, they are entitled, under the statute, "to receive, in addition to the profits to be accounted for by the defendants, the *damages* they had sustained thereby."

The damages follow, by the law, as one of the results of the decree, whether specifically prayed for or not. It has been so held in England under Lord Cairns' act, (22 and 22 Vict. Cap. 27,) which simply gives jurisdiction to the court of chancery to award damages, if it sees fit so to do. *Betts* vs. *Neilson*, 16 Weekly Rep., 524; *Id.*, 19 Weekly Rep., 1125; *Cotton* vs. *Wyld*, 32 Beavan, 266.

2. I have examined the testimony taken by the master, returned and filed with his report, upon which he bases his award of $1,200 for damages to the complainants. It appears that the defendants purchased the machine in the open market, without a knowledge of the patent; that they used it about nine months, commencing in September, 1870, and ending in June, 1871; that it was used solely in their own business in sawing boards for the manufacture of trunks, and that they abandoned all the patented appliances to the machine, when notified of their infringement, and before the suit was commenced. No case is therefore made for exemplary damages, and the sole question is whether the amount fixed by the complainants for a license fee to be paid by persons engaged in business of the character carried on by the defendants is a fair criterion by which to judge of and measure the damages suffered by complainants from the defendants' infringement.

The courts have always found it difficult to lay down any precise rule of damages in patent cases. The legislation of Congress in the matter is quite suggestive. By the 5th section of the act of 1793, if any person made or used an invention without the consent of the patentee he forfeited and became liable to pay to the patentee a sum that should be at least equal to three times the price for which the patentee had usually sold or licensed to other persons, the use of the said invention. This was found in actual practice to be a measure of damages both inconvenient and harsh; inconvenient, because it did not make provision for those cases where the patentee manufactured and sold his invention and depended upon the profits thus realized for his remuneration; and harsh, because it did not allow any discrimination to be made between the innocent violator and the wilful pirate. The 14th section of the act of July 4, 1836, before referred to, restricted the jury to *actual* damages, but allowed the court in its discretion to treble the amount, according to the circumstances of the particular case. This section has been re-enacted in the law of July 8, 1870, and, in addition thereto, authority has been conferred upon the court, sitting in equity, to ascertain and assess, not only the profits of the infringer, but the damages of the inventor, with power of a corresponding increase in its discretion. But, although no rule can be laid down applicable to all cases, there is one which ordinarily applies to cases of this sort, where the patentee depends upon license fees or royalties for his compensation for the use of his invention. If he has an established license fee, the amount of such fee is his loss or damage for the use of the invention without a license.

The Supreme Court, in *Seymour et al.* vs. *McCormick*, 16 How., 490, says: "Where an inventor finds it profitable to exercise his monopoly by selling licenses to make or use his improvement, he has himself fixed the average of his actual damages, when his invention has been used without his license." The same rule was applied in *Sickles* vs. *Borden*, 3 Blatch. C. C., 543; in *Goodyear* vs. *Bishop*, 2 Fish., 160; and in *Spaulding* vs. *Page*, 4 Fish, 641.

The defendants seek to avoid the application of this rule in the present case by showing that they ceased to use the complainants' invention, when apprised of the patent, and substituted other appliances which rendered the machine quite as effective and useful for their purposes. I do not now listen to the suggestion of complainants' counsel that these substituted appliances are mere mechanical equivalents, for this is not the proper time and mode of trying that question; but, surely, the defendants are not permitted to get rid of the consequences of a confessed infringement by alleging that they might have used some other machine as advantageously as the complainants'. However available such proof might be in considering the question of the defendants' profits, it has no weight in measuring the complainants' damages.

I am, therefore, of the opinion that the exceptions must be overruled and the master's report confirmed, and it is ordered accordingly.

Such a decree in this case will give to the defendants the right to use the invention of the complainants during the life of the patent.

SUPREME COURT OF THE UNITED STATES.

BENONI E. GARDNER, APPELLANT, *vs.* THE GOODYEAR DENTAL VULCANITE COMPANY *et al.*

[*Appeal from the circuit court of the United States for the district of Rhode Island.—Motion No.* 133.—*December Term*, 1871.]

A compromise was made between the parties to a suit for infringing a patent, in pursuance of which a decree for the complainants was entered in the circuit court, and affirmed on appeal in the Supreme Court, and they paid defendant's counsel as well as their own. Upon these facts being shown to the Supreme Court the decree of affirmance was vacated, the appeal dismissed, and the mandate which had been issued to the circuit court was recalled.

Mr. Chief Justice CHASE delivered the opinion of the court:

The original suit in equity was brought by the Goodyear Dental Vulcanite Company against Gardner to enjoin him from the use of certain patented subjects belonging, as alleged, to the company, and for an account. The case was heard upon a bill, answer, and testimony, and there was a decree in favor of the company in the circuit court for the district of Rhode Island in September, 1870. Upon appeal to this court the decree below was affirmed on the 6th of May, 1872, but the opinion has not been read.

The defense was conducted by counsel originally employed and paid by Newbrough, under whom Gardner was licensee. On the 1st of July, 1869, before the decree in the circuit court, Newbrough and the company compromised all matters of difference between them, with the understanding that this suit should go on to the final hearing and determination, both in the circuit court and in this court on appeal, as if the compromise had not been made.

The company, however, paid the counsel employed for the defense as well as for themselves in the circuit court, and subsequently in this court.

These facts appear from the record and from the admissions of the company in the ninth article of their answer to the motion to dismiss the appeal. They are the only facts which we think it necessary to notice.

It may be that the company has not become the legal or equitable owners of the opposing interests involved in the suit. There may be, and doubtless are, large opposing interests of which they are neither the legal nor equitable owners. But it cannot be admitted that one party to a suit can pay the fees of counsel on both sides, both in the court below and on appeal, without being held to have such control over both the preparation and argument of the cause as to make the suit merely collusive in both courts. It can make no difference that the counsel fees were charged to the party, apparently though not really liable to pay them, and payment from the other party procured through him. This, indeed, is a circumstance against the party who pays the fees rather than in his favor.

The motion to vacate the decree of affirmance heretofore made, and to dismiss the appeal, must, therefore, be granted, and an order made to recall the mandate which has been issued to the circuit court. We take occasion, however, to say that we see nothing in the conduct of the counsel who actually represented the company which merits blame or which ought to affect in any degree the high esteem in which they have been held. Neither of them appears to have had any knowledge of any arrangements made by their clients with the opposing party.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,528.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,436.—*Machines for Wringing Clothes.*—Granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, and May 14, 1867. Hearing March 19, 1873.

23,445.—*Paper-Folding Machines.*—Granted to CYRUS CHAMBERS, Jr., April 5, 1859. Hearing March 19, 1873.

23,448.—*Valve Arrangements of Steam-Engines.*—Granted to HENRY CLAYTON, April 5, 1859. Hearing March 19, 1873.

23,491.—*Machinery for Laying Rope.*—Granted to GEORGE W. PITTMAN and WILLIAM C. BOONE, April 5, 1859. Hearing March 19, 1873.

23,520.—*Burnishing-Machines.*—Granted to LE ROY S. WHITE, April 5, 1859. Hearing March 19, 1873.

23,525.—*Bedstead-Fastenings.*—Granted to LEVI W. BUXTON, April 5, 1859. Hearing March 19, 1873.

23,533.—*Faucets.*—Granted to GEORGE W. RANDALL, April 5, 1859. Hearing March 19, 1873.

23,536.—*Pyrotechnic Night-Signals.*—Granted to MARTHA J. COSTON, administratrix of B. F. COSTON, deceased, April 5, 1859. Hearing March 19, 1873.

23,577.—*Sewing-Machines.*—Granted to WILLIAM CLEVELAND HICKS, April 12, 1859. Hearing March 26, 1873.

23,589.—*Steam-Generators.*—Granted to ALEXANDER B. LATTA, April 12, 1859. Hearing March 26, 1873.

23,598.—*Screw-Propellers.*—Granted to JAMES MONTGOMERY, April 12, 1859. Hearing March 26, 1873.

23,613.—*Harvester-Rakes.*—Granted to HIRAM H. SCOVILLE, April 12, 1859 Hearing March 26, 1873.

23,622.—*Cooking-Stoves.*—Granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, and April 7, 1868. Hearing March 26, 1873.

23,635.—*Gates for Canal-Locks.*—Granted to CORNELIUS W. WILLIAMS, April 12, 1859. Hearing March 26, 1873.

23,642.—*Obtaining Fibers from Waste Felted Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865. Hearing March 26, 1873.

23,643.—*Machines for Disintegrating Waste Felt Fabrics.*—Granted to JOHN F. GREENE, April 12, 1859. Hearing March 26, 1873.

23,650.—*Steam-Boiler Furnaces.*—Granted to JONATHAN AMORY, April 19, 1859; reissued, No. 2,057, August 20, 1865. Hearing April 2, 1873.

23,665.—*Cooking-Ranges.*—Granted to B. WELLS DUNKLEE, April 19, 1859. Hearing April 2, 1873.

23,703.—*Machines for Making Drain-Pipes.*—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, April 19, 1859; reissued February 28, 1865, January 14, 1868, and April 27, 1869. Hearing April 2, 1873.

23,707.—*Harvesters.*—Granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, again, in three divisions, Nos. 4,824, 4,825, and 4,826, March 26, 1872. Hearing April 2, 1873.

23,710.—*Stoves.*—Granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, and in two divisions, No. 1,621 and 1,622, February 16, 1864; No. 1,621 being again reissued September 27, 1864, and February 12, 1867. Hearing April 2, 1873.

23,725.—*Double-Seaming Machines.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 9, 1873.

23,726.—*Machines for Corrugating Sheet Metal.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859. Hearing April 9, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,963, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 5,259, January 22, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

23,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERRIHON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,860.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,903.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,998.—*Surgical Splints.*—Granted to DAVID AMI, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,169.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WEBSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,207.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL P. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. FALKER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABBATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHEBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,291.—*Improved Metallic Band for Baling*, granted to GEORGE BRODIE, March 22, 1859; reissued April 27, 1869, numbered 3,405.

Claim.—1. The bale-tie, formed by passing the bent ends or loops of the hoop A into the link B and holding them there by means of the pins C C passed through them and over the sides of the link, in the manner herein described and shown in Figs. 1 and 3.

2. The bale-tie formed by passing the loops of the hoop A into one or more recesses in the link B through a slit or opening in its side, and holding said loops in the recesses by placing pins G within them, and thus giving such extension to the loops as to prevent their being withdrawn from the recesses while the pins remain in place, in the manner herein described, and as shown in Figs. 4 and 5.

3. The connecting-link of a bale-tie, having a slit or opening in its side or end through which the hoop can be introduced into the link, as herein described, and as represented in Figs. 6, 7, 13, and 14.

23,309.—*Envelope*, granted to SIMON E. PETTER, March 22, 1859.

Claim.—The form of envelope-blank herein described and represented, whether cut from a continuous roll of paper or from separate sheets.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 18, 1873.]

6,493.—*Ornamenting Rolls.*—OTTO F. FOGELSTRAND, Kensington, Conn., assignor to JOHN P. CONNELL, same place.

6,494.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,495.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,496.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,497.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,498.—*Floor Oil-Cloths.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y.

6,499.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,500.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,501.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,502.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,503.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,504.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,505.—*Floor Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y.

6,506.—*Beer-Mug.*—J. ERNEST MILLER, Pittsburg, Pa.

6,507.—*Lounge.*—JOHN B. ROHRER, Philadelphia, Pa., assignor to SAMUEL COOPER and JOHN HALL, same place.

6,508.—*Basket.*—SAMUEL L. RUSSELL, Chicago, Ill.

6,509.—*Organ-Case.*—SAMUEL HAYWARD, Boston, Mass., assignor to J. ESTEY & COMPANY, Brattleborough, Vt.

6,510.—*Organ-Case.*—SAMUEL HAYWARD, Boston, Mass., assignor to J. ESTEY & COMPANY, Brattleborough, Vt.

6,511.—*Organ-Case.*—SAMUEL HAYWARD, Boston, Mass., assignor to J. ESTEY & COMPANY, Brattleborough, Vt.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date March 18, 1873.]

1,166.—*Smoking and Chewing Tobacco.*—LEWIS BREMER'S SONS, Philadelphia, Pa.

1,167.—*Smoking and Chewing Tobacco.*—LEWIS BREMER'S SONS, Philadelphia, Pa.

1,168.—*Files.*—CROCKER CUTTER-TOOTH FILE COMPANY, Norwich, Conn.

1,169.—*Syrup.*—FAIRBANKS & GILMAN, New Orleans, La.

1,170.—*Syrup.*—FAIRBANKS & GILMAN, New Orleans, La.

1,171.—*Cough-Balsam.*—FRANK W. KINSMAN, Augusta, Me.

1,172.—*Smoking-Tobacco.*—ROBERSON TOBACCO MANUFACTURING COMPANY, Louisville, Ky.

1,173.—*Fine-Cut Chewing or Smoking Tobacco.*—ROBERSON TOBACCO MANUFACTURING COMPANY, Louisville, Ky.

1,174.—*Rubber Hose.*—THE BOSTON ELASTIC FABRIC COMPANY, Boston, Mass.

1,175.—*Rubber Hose.*—THE BOSTON ELASTIC FABRIC COMPANY, Boston, Mass.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date March 18, 1873.]

ORIGINAL PATENTS.

136,803.—*Staple-Socket for Hames.*—RICHARD J. ALGEO, Kalamazoo, Mich., assignor of one-half his right to A. UTLEY NOBLE and BENJAMIN CLEEKEWERCK, same place.

The metallic shield is shaped to slip over the hames, and is cast with the breast-strap and hame-tug staples.

Claim.—The arrangement of the socket C under the iron B of the hame A, the latter being tenoned to receive the inner and back edges of said socket, in the manner and for the purpose set forth.

136,804.—*Horse-Collar Cap.*—RICHARD J. ALGEO, Kalamazoo, Mich.

A zinc collar-cap is covered with leather entirely, and with a slotted girder for the collar fastening.

Claim.—1. As a new article of manufacture, a collar-cap, A, of sheet-metal, having a backing, C, of leather, pressed over its edges, as shown and set forth.

2. The combination, with the cap A and backing C, of the slotted girder B, as and for the purpose set forth.

136,805.—*Clover-Separator.*—CHARLES L. ALLEN, Flat Rock, assignor to JOHN L. HOOD, Grafton, and EUGENE ARMSTRONG and HENRY C. HOOD, Ash, Mich.

Arrangement of sieves in a shoe for thoroughly winnowing the clover and obviating the necessity of running it or any of it through the thrasher a second time.

Claim.—The construction and arrangement, with relation to the shoe A, screens B C, spout E, and screen F, of the partitions *a b*, conductor *d*, spout G, and its screen H, substantially as shown and set forth, and for the purpose specified.

136,806.—*Direct-Acting Steam-Engine.*—JOHN BAILEY, Quincy, Ill., assignor of one-half his right to HENRY BREITENSTEIN, same place.

Steam entering a conduit leading to an upper cut-off and to the lower end of main cylinder presses against the piston and valve in the latter, and, on account of differential areas, raises the same (steam having entered supplementary cylinder and raised the cut-off valves and closed the upper port to main cylinder) until the valve passes a port which permits steam in supplementary cylinder to be exhausted through lower end of main cylinder, and the cut-off valve to descend by gravity and pressure of steam acting as a cushion between its head and an adjustable piston, the upper port of main cylinder being thus opened. Cone-shaped device employed instead of stuffing-box, and cone-shaped projections and recesses to prevent concussion of several valves and pistons, water and steam being caught therein.

Claim.—1. The cylinders D and E, provided with the adjustable cylinder-head V, in combination with the rod P, piston N, and head R, substantially as shown and described.

2. The cone L, valve H, provided with the pocket *l*, in combination with the piston-rod F and cylinder C, substantially as shown and described.

3. The cylinder B, provided with the annular groove *a*, in combination with the piston-head G and conduit M, substantially as shown and described.

4. The cylinders B and C, in combination with the rod F, piston G, and valve H, substantially as shown and described.

5. The piston-rod P, having its surface so reduced as to allow a passage of steam between the head R and valve O, and below the latter, arranged relatively to the cylinder D, conduit M, and port *f*, substantially as shown and described.

6. The piston-head N, provided with the annular recess *m*, in combination with the port *g* and bumper T, substantially as shown and described.

7. The loose valve, consisting of the piston N, with pocket *t*, rod P, valve O, and head R, in combination with the head V and bumper T, and arranged in the cylinders E D, provided with the ports *f* and *g*, conduit M, and escape-pipe S, substantially as shown and described.

8. The arrangement of the conduit M and escape-pipe S and ports *g* and *f*, in relation to the several cylinders, substantially as shown and described.

9. The combination of the cylinders B C with the cylinders D E, arranged substantially as shown and described.

10. The rod F, provided with the valve H and piston G, in combination with the rod P, provided with the piston N and valve O, and the several cylinders, the conduit M, escape-pipe S, and ports *g* and *f*, substantially as shown and described.

11. The cylinder D, provided with the space *e*, and arranged relatively to the head R, valve O, ports *f* and *g*, substantially as shown and described.

136,807.—*Machine for Pointing Pickets.*—HIRAM BALCOM, Ann Arbor, Mich., assignor to himself and ALFRED H. PARTRIDGE, same place.

The lever carrying the knife is pivoted to adjustable blocks in the sides of the standards by an adjustable block in itself, thus affording a compound movement for adaptation to varying widths of pickets.

Claim.—1. The forked lever C, provided with the knife D and guide-plates E E, pivoted through the fulcrum-pin F to the standard B, as and for the purpose set forth.

2. The arrangement of the block *b* in the standard slot *a* and

of the blocks *c c* in the lever-slots *d d*, the guide-plates E E and fulcrum-pin F, for giving the lever a compound adjustment to its fulcrum, substantially as and for the purpose set forth.

136,808.—*Hospital-Canteen.*—HUGO BECK, Detroit, Mich., assignor to himself and ULRICH KREID.

A tin case or can with three receptacles on its upper end, with a drinking-cup on the center opening. On its bottom is connected a receptacle for surgeons' instruments, bandages, lint, &c., and on its side is a box for plasters, all for army purposes.

Claim.—A hospital-canteen, composed of the parts A C, the former being subdivided into two compartments as described, and provided with a drinking cup, B, and the latter being divided into compartments as described, and provided with the pocket D, substantially as and for the purposes set forth.

136,809.—*Siphon-Pump.*—JAMES M. BOIS, Salamanca, N. Y.

The stop-cocks in the lower ends of the legs of the siphon are first closed and the siphon filled through an opening in the crown. All the cocks are then opened and the water is discharged through the lower end of the long leg until its momentum closes the valve in said leg, when the water will raise the valve in the discharge arm or duct and flow out though the faucet, thereby relieving the valve in the long leg of excessive pressure and enabling the spring to open the valve, when the same operation will be repeated.

Claim.—In combination with a siphon, the valves *b h f*, the cocks *g i*, and duct *e*, when arranged to operate as specified.

136,810.—*Treadle.*—JOHN B. BOLINGER, Michigan City, Ind.

The friction mechanism is attached to the shaft, and the treadle and said shaft attached to each other by means of belts passing over a cross-bar, so that when the treadle is operated a continuous rotary motion in one direction is given to the shaft.

Claim.—1. The pulley A with lateral flange D, in combination with the friction-pawl H, spring I, and eccentric G, said pawl H being arranged to act against the lateral flange D in producing the rotation of the pulley A, substantially as described.

2. The drums E E' with eccentrics G, pulleys A A' with flanges D D', pawls H, and springs I, arranged and operating on the shaft B, substantially as and for the purpose specified.

3. The brake R r R, operated by the treadle M, and acting on the pulleys A A', substantially as and for the purpose specified.

4. The combination of the pitman N N', double belt O O', pulleys E E', eccentrics G, pawls H, springs I, and pulleys A A', the whole being so arranged as to produce a continuous rotation of the shaft B on imparting a reciprocating motion to the pitman N N', substantially as described.

136,811.—*Hitching-Strap.*—ALMUS M. BRUBAKER, Millersville, assignor of two-thirds his right to WILLIAM COMPTON and ABRAHAM B. GREENWALT, Lancaster, Pa.

The hitching-strap is stiffened by the insertion of a rod so as to preserve trees, &c., to which the animal may be attached.

Claim.—The combination of a rigid detachable rod, A, with loops *a*, with a continuous hitching-strap, B, in the manner and for the purpose specified.

136,812.—*Safety-Clamp for Rock-Drill Rods.*—MILAN C. BULLOCK, New York, N. Y., assignor of one-fourth his right to SAMUEL E. GRISCOM, Mahanoy Plane, Pa.

The vertical teeth of the gib prevent the rod from turning, while the upwardly-projecting teeth of the wedge serve the usual purpose of supporting and retaining.

Claim.—1. The safety-clamp for rock-drill rods, operating as described, and provided with an arm, G, whereby it may be secured in a fixed position.

2. The above-described combination, in a clamp for rock-drill rods, of a gib whose face is formed with vertical teeth, and a wedge whose face is formed with horizontal upwardly-projecting teeth.

3. The combination, in a clamp for rock-drill rods, of the parts A and B, constructed and arranged as shown and described, with a gib and wedge which clamp the rod.

4. The combination, with a clamp for rock-drill rods, of the gib I, whose face is formed with vertical teeth, operating as described.

5. A clamp for rock-drill rods, consisting of the parts A and B, provided with means for supporting the clamp, the gib I, set-screw M, and wedge H, all constructed and operating substantially as above set forth.

136,813.—*Car for Carrying Petroleum.*—JOHN CLARK, Pontiac, Mich.

Upon a flat car is placed a close metallic tank having an opening in the top, through which the tank is filled. The tank is strengthened by an internal wooden frame, which is made so as to be flush with the top. Over the top of the tank is fitted a wooden cover, which is used on return trips to carry freight.

Claim.—The tank B B', provided with the internal wooden frame-work D D', and inclosed by the cover E, substantially as and for the purpose set forth.

136,814.—*Wagon-Seat.*—ANDREW J. COGAN, Bon Homme, Dakota Ter.

The seat-bottom rests upon supports, the lower ends of which are fitted to the wagon-body. The upper portion of the seat is separate from the bottom, and between the two spiral and rubber springs are placed, the bottom of the seat having a vertical movement within the sides.

Claim.—The spring-seat, having for its support spiral springs and rubber blocks, the whole arranged in the manner shown and described.

136,815.—*Apparatus for Casting Type.*—ALFRED C. CONVERSE, Boston, Mass.

The furnace-flues are arranged in close proximity to the ejector-tube, and between the exterior case and the walls of the metal pot, to maintain a proper temperature of those parts.

Claim.—1. The arrangement of the draft-flues K K so as nearly to surround the passage *a*, through which the molten metal flows and is ejected, substantially as and for the purpose described.

2. A casing, E, in combination with the metal pot A and the cover *d'*, substantially as described, for the purpose set forth.

3. A lining, G, extending over the flues *k* and around the flues *f g h i*, in combination with the metal pot A and casing E, as and for the purpose described.

136,816.—*Roll for Rolling Railway Rails.*—JOHN W. COOPER, Hubbard, Ohio, assignor to AMOS E. ROGERS, La Grande, Oreg., and CYRUS ROOSE, Newcastle, Pa., trustees.

The invention is fully explained by the claims and drawing. Its object is to roll a sectional rail of which the inferior portion shall interlock with both the head and web of the superior portion.

Claim.—1. The rolls A A', constructed with grooves *a a*¹ and reduced rib *a*², as and for the purpose described.

2. The rolls B B', constructed with grooves *b b*¹ and projecting rib *b*², as and for the purpose set forth.

136,817.—*Means for Buoying and Stopping Holes in Vessels.*—JOHN W. COOPER, Hubbard, Ohio, assignor to AMOS E. ROGERS, La Grande, Oreg., and CYRUS ROOSE, Newcastle, Pa., trustees.

Flexible and inflatable flat bags are suspended from the gunwales of vessels, and are connected by cords which pass around the outside and up through tubes in the bottom, and are operated by a windlass on decks so that the bags can be drawn down to cover any leak below the water-line.

Claim.—A flat, flexible, and inflatable bag, B, secured to the gunwale, and stretching-cords passing down the side of the vessel, up through the tubes C, and connecting with windlasses D on deck, all as shown and described, whereby said bag may be adjusted to cover a breach at any point in the side of the vessel, as set forth.

136,818.—*Screw-Cutting Machine.*—CHARLES S. CRANE and WILLIAM H. LAVINIA, Chicago, Ill.

The jaws are slotted where they are pivoted to the frame, allowing them to drop slightly when opened. They are drawn up in place again by two pins projecting from the frame, which pass through inclined slots in the jaws, and by a yoke of the jaws depressed by a lever. They are opened by a wedge depending from the center of the yoke.

Claim.—1. The combination of the jaws *c* and *d*, slotted at *e* and *h* and pivoted to the frame *a* provided with pins *h*, substantially as and for the purposes specified.

2. The combination of the jaws *c* and *d*, constructed and operating as described, with the wedge *i*, yoke *j*, and lever *k*, substantially as described.

136,819.—*Gage for Setting Carriage Axle-Trees.*—LEWIS D. CROSS, Phelps, N. Y.

A bar is provided with a cross-piece and two adjustable pieces which are set to the angle at which the ends of the axle are to be bent.

Claim.—In combination with the stock A of carriage-axle setters, the graduated bars B and B' having the fixed arms *g* and *h* and the adjustable gage G, arranged to be adjusted in the manner and for the purposes set forth.

136,820.—*Pruning-Shears.*—MYRON DE GROODT, Eaton, assignor to THERON S. DE GROODT and LAFAYETTE DE GROODT, Pratt's Hollow, N. Y.

A two-edged oval blade is pivoted upon a single upright blade furnished with overhanging double or anchor-like hooks. The tangs of the blades are bent outward so as to allow the handles to pass each other when different sides of the oval blade are to be brought in use. Thus two pairs of shears are furnished from two single blades.

Claim.—Pruning-shears composed of a two-edged blade, A, and an overhanging double or anchor-like hook, B *b b'*, the respective tangs A' and B' of which are bent, throwing the handles out of line so that they can move past each other, all substantially as and for the purpose specified.

136,821.—*Adjustable Ingot-Mold.*—MAHLON S. DRAKE, Newark, N. J.

The upper part B is held at an angle to part A, and the unflanged edge is slipped over the flange of the other part B, until the proper countersinks come under the set-screws, when the handles are griped, and the two parts come together firmly ready for use.

Claim.—1. A mold for casting ingots, consisting of two parts, A and B, having flanges *f*, substantially as and for the purposes described.

2. Part A having a bottom plate, C, and standards E E, with or without the screws G, substantially as and for the purposes set forth.

3. In combination, parts A and B, plate C, lip D, standards E E, screws G, countersinks *o o o*, flanges *f f*, and handles H H, substantially as and for the purposes set forth.

136,822.—*Reversible Car-Seat.*—PETER F. DUCHEMIN, Somerville, Mass.

Claim.—1. A reversible car-seat back, provided with arms *a* made in one and the same piece therewith and pivoted, substantially as described.

2. The plate *d*, in combination with the central standard E or seat-frame G, for supporting and steadying the back of the seat, substantially as described.

3. The stud *e* projecting from the side of the car, in combination with the arm *a* of the back C, substantially as set forth.

136,823.—*Sewing-Machine.*—JOHN V. D. ELDREDGE, Detroit, Mich.

The feed-actuating bar is bent so as to alternately engage the upper and lower parts of the feed-dog to raise and lower it, and it is provided at its side with a wedge-shaped cam, which, as the bar moves forward, engages the spring-latch and moves the dog forward, but on the return movement of the bar the thinner portion of the wedge-shaped cam passes between the latch and feed-dog and does not move it longitudinally.

Claim.—1. The combination of the feed-piece R having the spring-latch *k* with the feed-actuating bar P having the wedge-shaped cam *c*, as described.

2. The slotted feed-piece, provided with the denticulated part *g*, latch *k*, and spring *l*, working in guides *e*, vibrating therein on the pin *f*, and reciprocated by the feed-actuating bar P, substantially in the manner described.

136,824.—*Chair-Brace.*—GEORGE F. ELLS, Deposit, N. Y.

A brace for chairs having three bearings, one on the seat and one on each of the front and rear legs.

Claim.—1. The application or combination of metallic trusses as units (and consisting, essentially, of brace, counter-brace, and tie) with the bottoms or rails and the legs of household chairs, settees, and other furniture, substantially as and for the purpose hereinbefore set forth.

136,825.—*Washing-Machine.*—OLIVER B. EVANS, Titusville, Pa.

A boiler with a revolving corrugated cylinder, over which are curved wings, the whole covered by a recessed lid.

Claim.—The boiler F and recessed lid S, in combination with the corrugated and perforated cylinder *a* and wings E, all arranged as and for the purposes specified.

136,826.—*Window-Screen.*—LEVI W. FIELD, Worcester, Mass.

The screen adjusts itself to the window-opening when the thumb-nut is released by means of the spiral springs acting on the extension piece, which is guided by the slots and screws.

Claim.—The guides C C, springs *b b*, thumb-nut *a*, and slide B, in combination with the bar D and frame A, all constructed and arranged substantially as and for the purpose specified.

136,827.—*Apparatus for Rendering Fats and Deodorizing the Gases.*—HENRY S. FIRMAN, New York, N. Y.

The digester is provided with a central hot cylinder, which receives air from a heating chamber placed over the furnace. Fresh air is admitted at the forward part of the heating-chamber. The products of combustion are deflected and caused to pass around the chamber by a downwardly-projecting curtain. The foul gases, after leaving the condenser, enter the furnace through a perforated pipe.

Claim.—1. Forming the arch or upper portion of the furnace with one or more downward or downwardly-inclined projections, Q Q, substantially as and for the purposes set forth.

2. In combination with the furnace L and heating-chamber O, the hot-air flue X, for conveying the heated air and gaseous products of the furnace directly into the heating-chamber, substantially as set forth.

3. The retort or delivery-pipe P, either perforated or close, arranged along the top and center of the furnace L, as and for the purposes set forth.

4. Mixing hot air from the drum J with the vapors and gases evolved in the rendering-tank, before burning in the furnace, as set forth.

5. The shield or curtain R, in combination with the furnace L, and heating-chamber O, for checking the flames and heated products until perfect combustion has occurred, substantially as set forth.

6. The arrangement of the pipe U for withdrawing air from the heating-chamber O and mingling it with the condensed vapors and gases before burning the same, substantially as set forth.

7. The use of charcoal, or its equivalent, in the retort, as a deodorizer of the noxious gases and vapors from a rendering apparatus, as described.

136,828.—*Wash-Board.*—JOHN B. FISHER, Amsterdam, N. Y.

Vertical grooves are made in the body of the board. Across these are placed horizontal ribs, which allow the water to run down the grooves out of contact with the clothes being washed.

Claim.—In a wash-board, the combination of the vertical gutters *x x* with the ribs *a a* and spaces *z z*, in which the said gutters will communicate with the faces of the several spaces *z z*, and will be run through the several ribs *a a*, and terminate on the lower side of the lowest rib *a*, substantially as shown and described, for the purpose specified.

136,829.—*Sad-Iron.*—SAMUEL S. FITCH, New York, N. Y.

A sad-iron cast with an opening to receive a heater, which is held in place by closing the opening with a latch or gate pivoted at one end, and in form to turn up or over, and is held, when closed, by slots in an extended part of the face of the iron.

Claim.—The chambered sad-iron made or provided with the threshold *b* and two projections or studs, *c c*, to its mouth, and having the door arranged therewith and pivoted to the body, all as specified.

136,830.—*Brace-Drill.*—GEORGE GIBBS, Canton, Ohio.

One end of the driving-shaft is tapered and forms the journal for a sleeve fitting over it, in the end of which the drill is secured. Motion applied with a common brace to the shaft is transmitted, through gear-wheels, to the sleeve, which is caused to revolve with a greater velocity than the driving-shaft, but in the same direction.

Claim.—The herein-described attachment for a bit-brace, consisting of frame I I' with handle O, brace-shaft A with tapering spindle A', hollow drill-shaft F, and gear-train B C D E, the several parts being constructed and arranged substantially as and for the purpose specified.

136,831.—*Clothes-Drier.*—EZRA BREWSTER GILDERSLEEVE, Wading River, N. Y.

A movable furnace, with a pipe having collars upon it, which supports arms on which the clothes are to be dried.

Claim.—The clothes-drier composed of the collars C and F and arms D, having the supports E, in combination with the pipe B of a gas and smoke consuming stove or furnace, substantially as shown and described.

136,832.—*Raising Sunken Vessels.*—RICHARD W. HALLETT, Brooklyn, E. D., N. Y.

Tanks for lightering vessels are sustained in their relative positions to the sunken ship by supplementary air-vessels on the surface of the water; said air-vessels having chains passing through them with means for adjusting the depth of the main tanks.

Claim.—In an apparatus for lightering ships and other similar vessels over bars and other obstructions, the combination of the regulating-floats with the lightering-tanks, substantially as described and for the purposes set forth.

136,833.—*Hook and Eye for Tackle-Blocks.*—JOHN HOLROYD, Washington, D. C.

Claim.—Turning the nib or point of the hook from the block, substantially as described, so that it will catch against the under side of the eye and prevent the hook from unhooking, and hold the block horizontally or at such an angle or position as may be desired.

136,834.—*Fish-Spawn Hatcher.*—MARCELLUS G. HOLTON, Rochester, N. Y., assignor of one half his right to SETH GREEN, same place.

A deep square box is filled with removable screens or spawn-holders, through which upward runs a stream of water. The rim is furnished with overflow-channels on every side to avoid a current at any particular point through the hatchers.

Claim.—1. The spawn-hatching apparatus A, constructed as described, to produce an equally-distributed upward flow or circulation of the water, for the purposes set forth.

2. In a spawn-hatching device, the trays *c* and water-inlet opening *a*, in combination with the deflector A, arranged to operate substantially as and for the purposes shown and described.

3. In combination with the spawn-hatching apparatus A, the overflow-channels C, arranged to equalize the overflow on all sides, substantially as and for the purposes set forth.

4. In combination with the spawn-trays *c*, the concave or hopper-shaped bottom B, substantially as described, for the purposes set forth.

136,835.—*Mold for Making Glass Blind-Slats.*—ELIAS B. HUNGERFORD, Corning, N. Y.

The dovetail on the bed-plate has a small recess to hold a wire staple, around which the glass is pressed.

Claim.—1. In a mold for forming pressed-glass blind-slats, the base block D, provided with the recess *c* in the dovetail, for holding the wire staple *c*, all as and for the purpose set forth.

2. A window-blind slat, constructed of glass, having inserted in it, in the act of pressing, a wire staple, substantially as set forth.

136,836.—*Table-Leaf Support.*—WILLARD JEFFS, Battle Creek, Mich.

A slide attached to a spring and to the table-cover, working in a bracket and through an opening in the end of the frame, with its end in form of a wedge and sliding upon a wedge-form piece attached to the table, (under side,) furnishing a support for the leaf.

Claim.—The wedge B, the slide C, and the spring D, all combined and arranged substantially as and for the purpose hereinbefore set forth and described.

136,837.—*Table.*—WILLARD JEFFS, Battle Creek, Mich.

The corner-blocks are formed by gluing together the required number of pieces of wood, so that the grain of one piece shall cross the grain of the adjoining piece. The side and end pieces are joined to the corners by tenon and mortise, and the legs are joined to the corner-blocks by being screwed in, or in any other suitable manner.

Claim.—The corner-block A constructed of two or more pieces of wood, as described, and adapted to the reception of the side and end pieces B and C and the leg D, substantially as and for the purpose hereinbefore set forth and described.

136,838.—*Mill for Grinding Paints.*—THOMAS R. KINGDON and LEMUEL P. DODGE, New York, N. Y.

Material fed upon the periphery of a larger and carried under a smaller cylinder. Discharge-spout held by spring or weight against the larger one scrapes it clean.

Claim.—The combination of a large lower roller, B, and of a small top roller, C, both rollers being geared together by cog-wheels of equal diameters, and operating in conjunction with a feed-apron and with a discharge-trough, substantially in the manner and for the purpose herein shown and described.

136,839.—*Sleigh-Brake.*—FRANCIS A. KIRCH, Mansfield, Pa.

Claim.—1. The square socket C with stays D D, having wedge-shaped mortises in their rear ends, in combination with the oscillating cross-bar E having wedge shaped shoulders at its ends to pass through said mortises, as herein set forth.

2. The tooth K, provided with the shank or tenon *f* and shoulders *i i*, and held rigidly in a mortise on the dog J by a ring, *h*, and allowing the tooth to be removed, substantially as herein set forth.

3. The pivoted dog J with removable tooth K, and the lever I attached to the dog between the fulcrum and the tooth, substantially for the purposes set forth.

4. The combination of the sliding tongue B, rods H H, levers I I, dogs J J, and removable teeth K K, all constructed and arranged substantially as and for the purposes herein set forth.

136,840.—*Composite Roofing.*—REINHARDT LEENDORFF, Detroit, Mich.

The composition described is laid on the roof and a coarse open fabric is stretched over it. The fabric is then pressed with a paddle until it is embedded in the composition. When dry a coat of paint is applied.

Claim.—The compound for covering roofs, composed of the ingredients in the proportions herein set forth, and adapted to a fabric of loose texture, in the manner and for the purpose set forth.

136,841.—*Cotton-Press.*—RICHARD LEWIS, Charleston, S. C.

Modo of compressing cotton bales on trucks provided with bars or openings for bands, (which may be on bottom of truck or in the bottom adjustable board, or both,) dispensing with the bars now on the press, leaving the platens a perfect plane, and so adjusting and securing the bales to the trucks that the taking in of the slack of the bands and locking or tying them is all that is required at the press.

Claim.—The compressing of cotton bales in trucks, as above described.

136,842.—*Animal-Trap.*—ARM TEAD M. LOVATT, Zanesville, Ohio.

A central inaccessible chamber is fitted for the permanent lodging of a decoy-animal, the avenues to it containing traps.

Claim.—1. In connection with one or more traps, S, a decoy-chamber with upper apartment A provided with bed or nest *b* and communicating with lower apartment A', the upper chamber having a removable top and the lower a removable bottom or floor, substantially as and for the purpose set forth.

2. The combination of decoy-chamber A and two or more radial traps, S, substantially as and for the purposes herein set forth.

136,843.—*Folding-Lounge.*—AUGUST LUNDBERG, Chicago, Ill.

The bed-bottom in the main frame is adjustable vertically by means of bent rods, to which it is pivoted. Said bed-bottom is jointed to aid in the adjustment. The head of the lounge is hinged to the end of the bottom frame. It is also made of two parts, hinged together and kept apart at the free ends by a hinged leaf, so that the head can be left at full height or partially raised.

Claim.—1. The combination and arrangement, in a folding-lounge, of the jointed bed-bottom E E', loops or staples *e e*, and the bent and pivoted rods D D, substantially as specified, and for the purposes set forth.

2. The combination and arrangement, in a folding-lounge, of the head H, part H', leaf H'', spring-bolt L and the button N', and the straps J or equivalent fastening devices, all operating together substantially as specified.

136,844.—*Fire-Escape Ladder.*—HENRY LYLES, Washington, D. C.

The ladder is composed of two tubes connected by rounds and properly stayed and braced, having means for connection with hose at bottom and a flexible nozzle at top for throwing water. The nozzle is manipulated from the ground by a cord. The tubular ladder is mounted upon wheels, and is adjustable both vertically and horizontally, the movements being effected by chains and windlasses. A shelf or platform, protected by a fire-shield, is provided near the top for the fireman. An auxiliary ladder, extending horizontally, affords exit from the windows of the burning building at the lower stories.

Claim.—1. In combination with the ladder D, constructed with tubular arms, the section of hose I with a helix *i*, and supplied with the manipulator I', substantially as and for the purpose set forth.

2. The combination of the ladder D, brackets J, and shelf or platform J' guarded by the shield I², substantially as and for the purpose specified.

3. The construction and arrangement with relation to the ladder D, having both of its sides or arms tubular and braced on three sides, as shown, and mounted on wheels, of the elevating and adjustable supporting device, the shelf or platform J', shield I², helix *i*, hose-section I, and manipulator I², when arranged and operating as shown, and for the purpose specified.

136,845.—*Railroad-Track Tamper.*—PATRICK MAGEE, New Orleans, La.

The earth is compressed beneath the track by means of the face-plates and pivoted jaws, operated by the hand-lever.

Claim.—The improved earth-tamping apparatus herein described, and consisting of the frame A, standards B, shafts *b* and *c*, lever *c*, cranks *d*, links *f*, arms *g*, clamps *h*, and face-plates *i*, when these are constructed and arranged for operation substantially as described, for the purposes herein set forth.

136,846.—*Cotton-Press.*—BENJAMIN G. MARTIN, New York, N. Y.

The swivel-braces are secured to the dick, revolving in the head-blocks and in the slide which carries the pawls that engage with ratchet-teeth on the stem of the follower. By turning the disk in one direction the follower is forced toward the foot-block, and by turning it in the other direction the slide is drawn back and the pawls take a fresh grip.

Claim.—1. The follower D, with its centrally-located stem J, provided with ratchet-teeth, in combination with the swivel-braces H, disk G, and slide E, and with the head-block of a press, substantially in the manner herein shown.

2. The combination of the follower D with its centrally located stem J, provided with ratchet-teeth and working-pawls K K, and stop-pawls L L, swivel-braces H, disk G, slide E, and head-block A, substantially as set forth.

3. The releasing-levers N M in combination with the pawls K K L L, swivel-braces H, slide E, follower D with its centrally-located ratchet-stem J, and the head-block A of a press, substantially in the manner and for the purpose shown and described.

136,847.—*Cider and Wine Mill.*—ALEXANDER MCCREIGHT and ROBERT W. GLASGOW, Tranquility, Ohio.

A series of bars passing crosswise through a cylinder and interlocking each other, held in position by a single key, said bars mashing the fruit by the revolutions of the cylinder in an eccentrically-shaped trough or box.

Claim.—1. The bars D, constructed so as each will interlock with another, and held in position by a single key, *b*, in the cylinder C, as and for the purpose set forth.

2. In a cider and wine mill, the combination of the interlocking arms D, cylinder C, and concave B, all constructed and arranged substantially as and for the purpose herein specified.

136,848.—*Washer for Nut-Locks.*—MALCOLM F. MCINTYRE, Girard, Pa.

A circular washer is provided with projections on its under side to prevent it from turning when used upon wood, and an overhanging shoulder to prevent it from turning when used upon iron.

Claim.—The washer A formed with the radial ribs C and flange C² and hollowed out on its under side, so that said ribs and flange may engage with suitable depressions in the wood, plate, or bar, in combination with the key F, substantially as shown and described.

136,849.—*Lamp.*—LEWIS MICHAELS, Covington, Ky.

The chimney-tube is made adjustable at any desired point by use of a "cap-tube," constructed and adapted for any size of lamp and independently of other connections with the lamp. Uses an attachable screw-thread and pin, spiral slot and pin, pinch-band and adjustable bracket.

Claim.—The cap-tube attachment for wall and ceiling lamps, when constructed independently of other mechanism, substantially as set forth and shown, whereby the cap-tube may be raised or lowered and secured in any desired position.

136,850.—*Breech-Loading Fire-Arm.*—ISAAC M. MILBANK, Greenfield Hill, Conn.

The sliding breech-blocks, with a tubular connection between them, around which is the eye of the lever *e*, are screwed together so as to be removable from the cylinder. Also, the spring-retractor has a steadying-pin that passes diagonally into the breech-block, and is retained in place by the firing-pin, that passes through an elongated opening in said steadying-pin. Also, the band upon the outside of cylinder to strengthen the same where the opening is made for the lever.

Claim.—1. The sliding breech-blocks *c d*, with a tubular connection between them, around which is the eye of the lever *e*, the parts being screwed together so as to be removable from the cylinder *b*, as set forth.

2. The spring-retractor *r*, having a steadying-pin, *s*, that passes diagonally into the breech-block *c*, and is retained in place by the firing-pin, that passes through an elongated opening in said steadying-pin, substantially as set forth.

3. The band *v* upon the outside of the cylinder *b* to strengthen the same where the opening is made for the lever *e*, and to aid in connecting the parts with the wooden stock, as set forth.

4. The safety-pin *o*, in combination with the eye of the lever *e* and the notch or opening 12, into which a portion of that safety-pin turns when the parts are in proper position for firing, substantially as set forth.

5. The latch *i* upon the lever *e* entering the cylinder *b*, in combination with the screw 5, or its equivalent, whereby the lever is either latched or locked, as set forth.

136,851.—*Stop Valve, Cock, &c.*—HARRY C. MONTGOMERY, Boston, Mass.

A double-convex reversible valve, made of glass or other non-corrosive substance, is arranged in a valve, cock, &c., being readily removed and replaced.

Claim.—1. A double-convex reversible valve made of glass or other non-corrosive substance, substantially as described, and for the purpose set forth.

2. In combination with the double-convex reversible valve E, the valve socket or shell D, the concave valve-seat G with the working-parts of an ordinary valve or faucet, substantially as described and shown, for the purpose set forth.

136,852.—*Railroad Rail.*—GEORGE C. MORGAN, Chicago, Ill.

Claim.—The combination of the sub-rail A, provided with the recessed flanges *c* and narrow boundary ledges, with the lining L and cap-rail B, provided with the flanges *d* extending laterally to the side ledges so that the spikes D will fasten the parts together and to the ties without the rivets or bolts, substantially as specified.

136,853.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Claim.—1. The machine for melting snow, consisting of the steam-boiler A, furnace B, tank C with perforated bottom, apron E, and auxiliary distributers G G', arranged substantially as and for the purpose specified.

2. The movable perforated steam-chests G G', constructed and arranged substantially as specified.

3. A machine for melting snow and ice on streets and pavements, consisting of a truck mounted on plain tired or rimmed wheels, and supporting a steam-boiler and furnace and a horizontal steam-tank, the latter located between the wheels, perforated in its lower surface, and otherwise constructed as shown, and having communication with the steam-boiler, substantially as specified.

136,854.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Snow is swept by a revolving brush into a double-walled hopper. Steam is conveyed from the boiler to the hopper and melts the snow.

Claim.—A machine for melting snow having a brush or brushes, D, and a receptacle for receiving the snow and melting the same, substantially as shown and set forth.

136,855.—*Washing-Machine.*—HIRAM MYERS, Highland, Kans.

A wash-boiler with a cylinder formed of net-work secured to the ends of it, and another within it secured or sustained by leading cords from a supporting cross-piece, and on its opposite side a ledge formed with cords to give motion to the clothes in its revolution.

Claim.—The cylinder S with the interior cylinder I and the division-walls J and K, in combination with the wash-boiler R, substantially as and for the purpose hereinbefore set forth.

136,856.—*Dish-Cover.*—AUGUSTUS J. OHMER, Hamilton, Ohio.

A glass cover for placing over cakes, pies, &c., has a handle on the top, in which is a metallic tube with a perforated cap for the passage of air and to prevent flies from entering.

Claim.—The glass cover A, provided with the orifice passing out through knob B, as a new article of manufacture, for the purpose described.

136,857.—*Manufacture of Rub-Irons for Carriages.*—HENRY W. OLIVER, Jr., Pittsburg, Pa.

A bar having a longitudinal section of sufficient width to serve as means of fastening the iron to the wagon, and with a beaded flange along one edge, which, by its excess of metal, presents a durable wearing angle, and at the same time saves the metal which heretofore has formed the other plate or half of the rub-iron.

Claim.—1. A wrought iron bar, having a flat longitudinal part, *b*, a narrow flange, *a*, at right angles thereto, and a bead, *s*, at the angle outside the flange, substantially as described.

2. An angled rub iron, *b'*, having a bead, *s*, on the outside of the angle at the point subject to wear, substantially as set forth.

136,858.—*Window-Blind.*—LINDEN PARK, Brady, Pa.

The slats are connected by single tapes on the inside by means of staples on their edges, and drawing-cords behind the tapes and a middle tape on the outside edge.

Claim.—The arrangement of the slats A suspended at top by hooks K K, and by a single pair of tape-lines, C C, on the inside of the blind, with the wire staple-fastenings B B, the drawing-string D running in notches on the sides of the slats A, through the staples B B, and through the blocks E E, and a small tape, J, on the outside of the blind passing through the center staples B, when combined and operating as herein described, and for the purposes set forth.

136,859.—*Attachment for Sewing-Machines.*—THOMAS J. PEASLEE, Boston, Mass.

The lips turn the edge of one piece of cloth and deliver it so turned on the upper side of a second piece resting against the shoulder, and in this condition the two pieces are united by stitching.

Claim.—The seamer as made or provided with the lips *f g* and the shoulder *e*, all being of one piece of metal, and arranged and constructed as shown and described.

136,860.—*Potato and Pea-Nut Digger.*—CYRUS E. PIERCE, Centreville, Mich.

A triangular frame carries a double plow, upon each side of which is placed a fingered mold-board, facing inward, and between them, and directly in rear of the plow, is placed a separating-wheel, armed upon each side with projecting rods.

Claim.—The combination of the finger-plates F with the frame A, opening-plow D D', and wheel E, as set forth.

136,861.—*Door-Bolt.*—ABRAM PELHAM, Plymouth, Mich., assignor to himself and REUBEN HAINES, same place.

A plain cylindrical bolt, with a toothed rack at the rear part, which is inserted in a mortise bored from the edge of the door, and in a cranked pinion mortised in a socket bored from the inner side of the door, which pinion engages with the rack of the bolt and reciprocates the latter in the rotation of the crank.

Claim.—The cylindrical bolt A, of uniform size throughout, inserted in a mortise bored from the edge of the door, in combination with the crank B' and pinion *b*, the bolt being adapted to be used without a covering-plate, as shown and set forth.

136,862.—*Composition for Artificial Stone, Tile, Pavement, &c.*—ANTONIO PELLETIER, Washington, D. C.

Claim.—The above-described composition of matter, formed of a mixture of Portland cement, oxide of zinc, or its equivalent oxide, sharp sand, and lime paste, in the proportions and molded as described, and when partly dry treated with a solution of the chloride corresponding to the oxide used in making the molded article, substantially as set forth.

136,863.—*Millstone-Driver.*—JOHN PLANCK, Constantine, Mich., assignor to himself and WILLIAM PATTERSON, same place.

The driver is connected to the bale by adjustable links, so that the two ends may pull equally upon the bale.

Claim.—The employment of an adjustable link or links at each end of a millstone-driver, for connecting the same to the bale of the runner-stone, substantially as shown and set forth.

136,864.—*Candlestick.*—ZIMRI I. PRATT, Chicago, Ill.

The cup which holds the candle against the spring is extended upward and outward in cup-shape, to prevent the dripping of the melted tallow over the outside of the candlestick. An annular flange is secured to the candlestick to serve in supporting it.

Claim.—1. A candlestick, substantially the same as set forth, when provided with the supporting-flange E, arranged to support the candlestick in the manner specified.

2. In a candlestick substantially the same as described, the cup D having its upper end terminating in a flaring rim, substantially as shown, and for the purposes specified.

136,865.—*Fare-Box.*—ZIMRI I. PRATT, Chicago, Ill.

Claim.—A fare-box for omnibuses and other similar vehicles, consisting of an elongated box, A, which is provided with flange G for fastening to or through the roof or driver's seat, with an incased rod, M, for operating the trap or valve C, with glass B at its top and glasses B¹ B² in its sides for convenience of seeing money put into either of the openings H or H', as and for the purpose set forth.

136,866.—*Combined Stalk-Cutter and Land-Roller.*—JOSEPH PRICE, Columbia county, Fla.

A common land-roller is provided with dovetailed longitudinal grooves, into which may be inserted, at pleasure, cutting-knives or lugs, thus making a convertible stalk-cutter or land-roller.

Claim.—The cylinder A, when provided with dovetail-grooves adapted to receive interchangeably the knives B and strips C, as and for the purposes set forth.

136,867.—*Perambulator.*—ARTHUR W. RICHARDS, Indianola, Iowa.

Claim.—The perambulating and adjustable cot formed by mounting the sections E G J upon the carriage A B C D, substantially as described, and for the purposes specified.

136,868.—*Lubricating-Compound.*—EDWIN ROAT, Buffalo, N. Y.

Claim.—A compound composed of any tallow, lard, oil, or grease ordinarily used for lubricating purposes, and beeswax mixed with a solution of sal soda, borax, salts of tartar, and carbonate of ammonia, to which is added plumbago, substantially in the proportions and for the purposes above set forth.

136,869.—*Drawer.*—FABIUS ROSE, Boston, Mass.

Two slides or plates are employed in combination with the drawer and its case or support, one upon each side thereof, said slides being attached to and sliding upon the sides of the case and in immediate contact with the sides of the drawers, while each side of the drawer is provided with a stud which rests and slides upon the upper edge of the adjacent slide. Each plate or slide has a long countersunk slot, in which slides a screw or knob attached to the adjacent side of the case.

Claim.—The invention herein described, consisting of the slides D D', in combination with the drawer B and its support, the slides containing the abutments *d* and slots *e*, and operating in connection with the screw or stops *b* and the drawer containing the spurs *a a*, the whole being in manner and operating substantially as hereinbefore explained.

136,870.—*Harness-Saddle.*—ABRAHAM V. SARGEANT, Newark, N. J.

The saddle is constructed so that it can be taken apart for repairs without ripping.

Claim.—1. The solid separate layer or leather middle piece C, when provided with the double-edged bindings *d d*, substantially as and for the purpose herein specified.

2. A harness or coach pad, composed of the bottom A, inclosed pad plate B, layer C, with its double-edged bindings, and the top D, all constructed and arranged substantially as herein described, so as to admit of replacing the pad-plate without unmaking or injuring the other parts of the pad, as herein specified.

136,871.—*Cartridge-Ejector for Revolving Fire-Arms.*—JOHN T. SMITH, GEORGE M. SAITH, and JOSEPH J. SWEENEY, Springfield, Mass.

Construction and combination of frame, hammer, and ejector-rod, whereby the ejector may be connected or disconnected at will with the hammer, and made to operate automatically to throw out the shell by the action of the main spring through the medium of said hammer and ejector.

Claim.—In combination with the hammer, the plunger B directly connected thereto by the arm *b* through the slot L, and so as to have lost motion within the hammer, being arranged to operate together, substantially as shown and described.

136,872.—*Process for Treating Tobacco.*—JUDSON A. STAFFORD and HARVEY C. FOWLER, Cleveland, Ohio.

American tobacco, or strong and gross qualities of tobacco, are macerated and pressed and desiccated, and then immersed in the liquid from scraps of Cuba or fine tobacco similarly treated.

Claim.—The improved process herein described of treating tobacco by extracting the rank flavor from the domestic tobacco and impregnating the same with the flavor of the Havana tobacco, substantially as and for the purpose specified.

136,873.—*Duplex Telegraph.*—JOSEPH B. STEARNS, Boston, Mass.

Electro-magnets or helices are arranged in a branch circuit from the equalizing relay-magnet circuit, the extra currents there from neutralizing the extra current in the line-relay magnet.

Claim.—In an apparatus for double transmission, the combination of a helix or series of helices with a branch or compensating circuit, whereby the effect of static induction upon the receiving relay or instrument is counteracted, substantially as and for the purpose herein specified.

136,874.—*Duplex Telegraph.*—JOSEPH B. STEARNS, Boston, Mass. Case B.

Improvement on patents 78,547 and 78,548, combining differential or equalizing relay of former with circuit changing and preserving key of latter.

Claim.—1. The combination of the circuit-changing key K, composed of the levers *a* and *b*, or their equivalents, the differential relay or receiving instrument, and the rheostats or resistance-coils R R′ and their connections, substantially as and for the purpose as set forth.

2. The differential relay composed of the coils M M′ N N′, connected as shown in Fig. 4 of the drawing, as and for the purpose as set forth.

136,875.—*Duplex Telegraph-Key.*—JOSEPH B. STEARNS, Boston, Mass.—Case D.

Preserves circuit of distant station in duplex transmission. When key-circuit is open, circuit from distant station is closed to the ground through D G O D′, when key-circuit is closed through D D′ C C′ and connecting-wires.

Claim.—The combination of the lever A, insulating-bar B, metallic plates C C′, metallic springs D D′, insulating-block M, projection G, and connecting-wires F F′ L E, and O, substantially as and for the purpose as set forth.

136,876.—*Telegraph Relay and Sounder.*—JOSEPH B. STEARNS, Boston, Mass.—Case A.

Shunt-circuit established around relay by action of its own armature-lever or by lever of the sounder it controls, thus lessening "retardation" and ensuring decisive action.

Claim.—In telegraphic apparatus, the combination, with the relay or receiving magnet, of a shunt-circuit, which is established automatically on the completion of the stroke of the relay-armature, as and for the purpose set forth.

136,877.—*Hasp-Lock.*—EDWARD P. STIMENS and THOMAS C. MARTIN, Perrysville, assignors of one-half their right to ABRAHAM CLARK, Osnaburg, Ohio.

The hasp is mounted on a shaft extending through the door, and arranged to drop through a staple on the door-jamb and enter the lock-box so as to permit the reception of the lock-bolt, thus allowing the hasp to be operated from either side of the door and to be locked when desired.

Claim.—The hasp B with catch C mounted on shaft *b*, which passes through the lock-plate *a* and door I, said hasp being arranged to be operated from either side of the door, and to drop into the lock-box A and be secured by the lock-bolt G, the several parts being constructed and combined substantially as specified.

136,878.—*Trowel.*—SUMNER F. STREETER, Bernardston, Mass.

The shank is not forged in one piece with the blade, but is attached, and its upper end is formed into a socket for the handle, which is fastened by the rod and nut.

Claim.—1. The shank B, provided with foot *b* and socket *b*¹, as described.

2. The tool described, consisting of the blade A, shank B, handle C, ferrule D, and rod E, all constructed and combined as described, for the purpose set forth.

136,879.—*Car-Coupling.*—JOHN M. SUTTON, Sutton's Corners, Pa.

When the weighted arm is thrust backward, it raises and holds the pin up until the lower face of the dog is struck by the entering-link.

Claim.—The dog E, constructed as described, in combination with the pin F, the lever C, and the link *n*, for the purposes set forth.

136,880.—*Loom-Stop Mechanism.*—JOHN J. SWITZER, Boston, Mass.

When the weft-thread breaks or fails one arm of a tumbler-lever in the shuttle comes in contact with the horizontal bent end of a vertical lever pivoted on the lay, thereby giving its lower end a slight lateral movement, sufficient to give a similar lateral movement to a horizontal lever pivoted just below it on the loom-frame. This movement of the horizontal lever causes its forward end to act on a cam-piece on a rock-shaft extending across the loom a little below the breast-beam, by which means the rock-shaft is rotated sufficiently to place an arm or incline projecting forward from it in such position as to raise the dagger on the lay as it beats up, and bring it in contact with the vibrating lever under the breast-beam, which is connected with the shipping-lever.

Claim.—1. The levers D F, the cam *e*, the rock-shaft G, the arms *f*, M, and H, combined and arranged together and with the loom-frame, the lay, and the operative shipper-actuating lever I such being to operate with the shuttle, provided with the lever and groove, as explained.

2. The lever and groove arranged in the shuttle and with the other thereof, as set forth, in combination with the shaft G, the levers D F D′ F′, cams *e e*′, shaft G, arms M, *f*, and H, and lever I, arranged and applied to the lay, the loom-frame, and the shipper, substantially as specified, the whole constituting a stop-motion, for the purpose set forth.

136,881.—*Apparatus for Treating Linseed-Oil.*—DUNCAN D. TEMPLETON, New York, N. Y.

The chemicals for bleaching and refining the oil are injected into and through the perforated tube. The air is exhausted from the boiler through the cock a^1, and the oil is admitted through cock a^2.

Claim.—The portable boiler or tank, having the perforated tube, as described, the boiler being adapted to be transferred to a furnace, and revolved, for collecting, treating, and drying linseed-oil, night soil, &c., substantially as set forth.

136,882.—*Button.*—ALBERT E. THURBER, Providence, R. I., assignor to EDWIN F. KEAT and GEORGE HALL, same place.

The end of the shank of the button is enlarged, and has a short screw-thread cut upon it. It is secured to a garment by means of a collet or chambered nut, the collet being screwed on the shank until it runs off the screw, and rests upon it at its smaller diameter.

Claim.—The chambered screw-nut or collet, as described, and the button-body, provided with the screw and reduced shank to operate with such collet, all being substantially as specified.

136,883.—*Fire-Escape.*—FRITZ A. L. VON EHREN, New Orleans, La.

The platform is retained in central position over the elevating apparatus by means of the system of jointed levers pivoted to the platform in the center, and to the blocks secured to the cross-arms of the elevating apparatus and moving in guide ways affixed to the platform. Rollers relieve the friction of the sustaining-levers when moving under the platform, and these rollers are guided by guard-rails. The elevating apparatus is securely braced at the foot by forked braces placed between the levers. A shield protects the apparatus from the intense heat.

Claim.—1. In combination with the levers K the sustaining-braces L L, for the purpose of making a compact support for elevators of this class.

2. The pivoted central bar *d*, links *c c*, sliding blocks *a a*, groove *b*, rods *x x*′, and rollers 2 2 2 2, whereby the platform N is held in central position over the levers K, substantially as described.

3. In combination with the apparatus above described, the fire-protection blanket P, for the purposes set forth.

136,884.—*Stove-Window.*—FRANCIS WARRINER, Troy, N. Y.

The box-frame has mica windows in front. Its inner sides project sufficiently far into the stove to be securely fastened thereto. Apertures in the sides of the box admit air into the stove.

Claim.—1. A frame for mica or other windows made in a box-form, with apertures in the outer part of such frame for the admission of small jets of air into said box, when such box projects into the fire-chamber of a stove or range sufficient to admit of its attachment to a stove or range, substantially as and for the purposes hereinbefore described and set forth.

2. The inner part of the box B, with the opening C, nibs I, when extending to and holding in position the mica O, the inner frame E in combination with the flange *f*, the lugs *c* and *k*, or their equivalents, and the apertures *a*, outer part of frame A, the projection of said box into the fire-chamber of a stove or range, substantially as and for the purposes hereinbefore described and set forth.

136,885.—*Reel-Rake for Harvesters.*—CYRUS A. WERDIN, Waukegan, Ill.

The rake is hinged to and revolves with the reel, and is adapted to be folded up and locked while passing over the platform, or to be locked in working position, as the operator may desire.

Claim.—1. The revolving arm U having the lever V pivoted thereto and fulcrumed in the cam W, constructed substantially as described, the outer end of the lever V being pivoted to the inner or upper end of the arm E′, in combination with the arm A′ also pivoted to the arms U and E′, substantially as described, all for the purpose of bringing the lower end or heel of the arm E′ to a state of rest and returning it to its original position during the operation of the reel, substantially as specified.

2. The false beater F′ pivoted to the arm E′, substantially as described, and carrying the hinged rake H, in combination with the rod G′, swivel-jointed to the beater F′ and to the reel.

3. The bent rod B′ attached to the reel and arranged in the slot D′ of the arm E′, substantially as and for the purpose specified.

4. The rake H hinged to the false beater F′, substantially as described, and having its forward folding movement limited by means of the bent pieces I I attached to the rake-head and engaging the said beater.

5. The hinged rake H, in combination with the slide J provided with lugs *j j* and the pieces I I rigidly attached to the rake-head and engaging the lugs *j j*, substantially as and for the purposes specified.

6. In combination, the slide N provided with the arm *n*, the pivoted link O, pivoted rod P, bell crank Q, pivoted rod R, slotted rod S, and rigid arm T, substantially as and for the purposes specified.

7. In combination, the pivoted lever K, way L, and connecting-arm E, substantially as described, and as a means of operating the slide N.

136,886.—*Dummy or Traction Engine.*—ARETUS A. WILDER, Detroit, Mich., assignor of one-half his right to ARTHUR RANKIN, Windsor, Ontario.

The exhaust steam is conveyed into one side of a steam-tight chamber placed transversely across the car, said chamber being provided at its upper interior side with inclined deflectors, which convey the condensed water to the bottom, from whence it is drawn by a drip-pipe. The uncondensed steam passes to and through a coil placed in the fire-box, where it is superheated and then escapes as hydrogen-gas through the smoke-pipe.

Claim.—1. The combination of chamber D, arranged to receive exhaust steam, as described, with the coil F located within the fire-box, as described.

2. The construction and arrangement, with relation to the boiler and engine of a dummy car, of the chamber D, deflectors *c c*, exhaust-pipes *b b*, drip-pipe *e*, the coils *f f*, and escape-pipe *g*, as and for the purpose set forth.

136,887.—*Machine for Breaking Coal and other Substances.*—RUFUS A. WILDER, Cressona, Pa.

A series of teeth, constructed with flanges in their centers and tapering toward each end, are inserted into the surface of a cylinder, and are held in place by means of the plates which are arranged between them.

Claim.—1. The teeth constructed as described, with a flange in their center, and tapering from such flange toward each end, as and for the purposes specified.

2. The plates constructed as described, and arranged between the rows of teeth, as and for the purposes specified.

3. In a coal-breaking machine the teeth, constructed as described, in combination with the plates and rotating cylinder, as and for the purposes specified.

136,888.—*Single-Tree.*—LEANDER WILLIAMS and WALTER S. MCKINNIE, Stonelick township, Clermont County, Ohio.

The trace is detached from the whiffletree by pulling a strap which is attached to the lever-fastener.

Claim.—1. In a single-tree, the combination of the lever-fastener C, constructed as described, with the trace-hook B, substantially as and for the purpose specified.

2. The combination of the lever-fastener C, the trace-hook B, and the forked spring D, substantially as and for the purpose herein set forth.

136,889.—*Car-Coupling.*—GEORGE WITHINGTON, Ione City, and FRANK F. TAYLOR, San Francisco, Cal.

A hinged plate, having a smooth under surface to give free escape to the link in case one car falls below the other, being bent up at the front end to form a hand-hold in removing the pin, forms the upper portion of the draw-head. The prong is so shaped as to permit the free escape of the link also, in case of accident.

Claim.—The prong C, constructed in the manner herein described, in combination with the hinged plate E, having a plane and smooth under surface, and the spring *c*, all constructed and arranged as and for the purpose specified.

136,890.—*Metallic Can for Meats, Paints, &c.*—EDMUND MORTIMER WOOD, Needham, Mass.

Claim.—A plate-metal vessel, having its body reduced in thickness in a narrow stripe along the line in which it is to be cut, the metal at each side of said stripe being thicker than at said stripe, as before set forth, such vessel being a new article of manufacture.

136,891.—*Made Feather.*—ALBERT E. WOLFE, New York, N. Y.

Two feathers are cemented together along their stems to form one full feather.

Claim.—As a new article of manufacture, the within-described feather A B C, composed of two natural feathers prepared and cemented together, substantially in the manner herein set forth.

136,892.—*Automatic Gate.*—WILLIAM L. WOOSTER, Harvard, Ill.

The gate is held open by a latch, which is operated by the same devices which open and shut the gate.

Claim.—The latch I, in combination with the wire A, and lever F, and post E, for the purposes set forth.

136,893.—*Machine for Making Match-Sticks.*—FREDERICK ZAISS, Philadelphia, Pa.

The matches, after being formed by the cutters, fall into a winnower for cleaning, straightening, and collecting in boxes.

Claim.—The cutter-head and cutters E F, butting-block G, and the winnower H, when used substantially for the purpose shown and described.

136,894.—*Breech-Loading Fire-Arm.*—GOTTLIEB ZELLER, Brussels, Belgium.

Claim.—The combination of the cock 5, provided with its finger-piece 5′, striker 7, and trigger 6, with the breech-block A, when the same is provided with the projection 2 A, the parts being constructed and arranged for operation as described whereby the gun may be cocked in the act of opening the breech or independently thereof, as set forth.

136,895.—*Railroad Switch.*—DON JUAN ARNOLD, Brownsville, Neb.

The connection of the swinging short rail is, by means of the side spring-straps *b b*, attached by bolts and elongated bolt-holes, which allow of the requisite play, in place of the ordinary hinge joint or pivot which is usual in this class of switches.

Claim.—The straps *b b* connecting the swinging frog-rail F to the crossing-rails A B, and made with elongated bolt-holes to allow the requisite vibration of the rail F, as set forth.

136,896.—*Shank-Laster for Shoemakers.*—JOSEPH H. BEAN, Cincinnati, Ohio.

A single handle, having a circular end, to which is pivoted the lower jaw, the upper jaw, pivoted to the lower, has in its projecting arm a set-screw, which, in moving over the circular end of the handle, operates to gripe or release, as may be required, by the movement of the handle.

Claim.—The shank-laster described, consisting of the handle A, having its bearing-surface arranged as described, the members B C, and the adjusting-stop D, substantially as described.

136,897.—*Tobacco-Hiller.*—ZACHARIAH D. BLAKISTONE, St. Mary's County, Md.—Case A.

A leveler, having a flat surface and central projecting rib for smoothing the ground and keeping the machine in a direct line. A hiller, having flanges on each side for drawing in the earth to form hills.

Claim.—1. A leveler, E, when provided with a rib, *b*, on its under side, for the purpose set forth.

2. A hiller, F, when provided with side ribs *i*, constructed substantially as described, and for the purpose set forth.

3. A hiller, F, when provided with side ribs *i* and a marking-rib, *h*, substantially as described, and for the purposes set forth.

4. A hiller, F, when provided with side ribs *i*, marking-rib *h*, and rearward-projecting piece *s*, substantially as described, and for the purpose set forth.

5. The combination of a hiller, F, with a runner, A, each being constructed substantially as described, for the purpose specified.

6. The combination of the leveler E and hiller F with a runner, A, all being constructed substantially as described, and for the purposes set forth.

7. The combination of two or more runners, when each is provided with a leveler, E, and hiller F, and with a single pair of handles, G, to guide the whole, substantially as described, for the purpose set forth.

136,898.—*Tobacco-Cultivator.*—ZACHARIAH D. BLAKISTONE, St. Mary's County, Md.

The weeding-blades are attached to spring-arms, and may be raised or lowered by means of levers and connecting-chains.

Claim.—1. A runner, A, when provided with a pair of cultivating implements, W, in front, and a pair of adjustable cutting or weeding blades, *m*, constructed and arranged as described, for the purpose set forth.

2. The weeding-blades *m*, when connected to the runner A by means of a curved spring-arm, *n*, for the purpose set forth.

3. In combination with the weeders *m* and curved spring-arm *n*, the lever *p* and connecting rod or chain *o*, for the purpose set forth.

136,899.—*Horse-Power.*—GEORGE M. BRANCH, Winona, assignor to W. A. MOORE, Magnolia, Miss.

The shaft-bearings slide in grooves within the uprights, and are adjustable by means of wedges.

Claim.—The combination of the bearings H N and wedges J O with the shafts G L, gear-wheels E F K, and bars I, substantially in the manner herein shown and described, and for the purpose set forth.

136,900.—*Hanging Bracket or Shelf.*—ALBERT C. BROWN, Chicago, Ill.

Pivoted cross-barred lattice, on which slide, by means of slots and pins, the shelves.

Claim.—The combination of a lattice extension frame and the slotted brackets B, substantially as specified, and for the purposes set forth.

136,901.—*Boot and Shoe Sole Stamp.*—ALFRED M. BURNHAM, Lynn, Mass.

The stamp attached to the presser-foot is for the purpose of impressing the number upon the surface of the sole during the cutting process.

Claim.—The combination of the stamp *a* with the presser-foot B of a sole-cutting apparatus, substantially as herein shown and described.

136,902.—*Ash-Sifter.*—CHARLES S COLLINS, Baltimore, Md., assignor of one-half his right to JOHN T. FLEEHEARTY, of same place.

Claim.—The covered vessel A, placed upon rockers, the smaller ash-receptacle C having its bottom and circumference perforated or in open wire-work, flanch *c*, plates or wings *d*, and supporting-brackets *e*, relatively arranged substantially as and for the purpose herein specified.

136,903.—*Sewing-Machine Table.*—WILLIAM M. CUTHBERT, Oil City, Pa.

The table-top is recessed, and the machine is attached to a hinged platform swinging down from said recess. A drawer protects the machine from dust when it is lowered beneath the table. Leaves are hinged to the ends of the table, that can be swung over onto the top of the table, so as to present the appearance of an ordinary table when the machine is not in use.

Claim.—1. The combination of the bed-plate F N, table-top R, platform M, and drawer E, all constructed to operate substantially in the manner herein set forth.

2. In combination with the above, the hinged leaves G G, when constructed to operate substantially in the manner herein set forth.

136,904.—*Artificial Stone.*—PHILANDER DANIELS, Jackson City, Mich.

Dissolves, by boiling, one pound of concentrated ley in two gallons of water; adds one-quarter pound dissolved glue and one-quarter pound isinglass, and mixes with it, when cool, from one to twelve ounces of soluble glass. This solution is applied to a mixture of two-thirds sand, one-third cement, and to each cubic foot thereof half a pound of pommeled glass.

Claim.—1. The solution as prepared from ley, glue, isinglass, and solution of glass, in connection with the suitable mixture of sand, cement, and pommeled glass, substantially as and for the purpose described.

2. The process of making artificial stone by means of the solution and other materials, as described.

136,905.—*Hat and Coat Hook.*—JOHN DANNER, Canton, O.

An ordinary metallic hat and coat hook is provided with a shank, partly plain, cylindrical, and partly screw-threaded. A series of these hooks are combined with the bars or frame of a swinging rack, so that they not only serve to pin or fasten the slats together, but, while retaining their own upright position, allow one set of the slats or bars to move obliquely into a diamond or rhomboidal form, the other set remaining horizontal and parallel with each other. This rack, hung up by rings against the wall, when swayed to the right or left, is held in place by a retaining-pin, while the tiers of hooks, themselves held upright, form an oblique line to admit of hanging clothes or hats upon any or all of them.

Claim.—A series of metallic hooks, having shanks partially plain and partially screw-threaded, and combined and united with two sets of slats or bars, B C, as and for the purpose described and represented.

136,906.—*Nut-Lock.*—BENJAMIN W. DAVIS, Fort Madison, Iowa.

Claim.—The curved spring *e*, provided with elongated openings for the bolts C, and also provided on its outer ends with vertically-projecting lips *g* having inclines and bearing against the side of the nuts, in combination with the ordinarily-constructed nuts D and fish-bar B, substantially as hereinbefore described, and for the purpose set forth.

136,907.—*Combined Adjustable Pincher and Grappling-Tool.*—SIMON B. DEXTER, Mason City, Iowa.

A pair of pinchers, operated by a wedged-shaped link passing through apertures at the end of its handles.

Claim.—1. In combination with the jaws A A and handles B B, the adjusting-holes D, eyes N, rod I, and slide J, arranged to operate as and for the purposes described.

2. The wedge-shaped slide J and rod I, in combination with the handles B B, as and for the purposes described.

3. The handle F, or its equivalent, and screw O in combination with the slide J, as and for the purposes described.

136,908.—*Washing-Machine.*—PRICE C. DILLAN, Villisca, Iowa.

A washing-machine constructed with two half-cylindrical racks, one within the other, the lower one attached to the frame, the upper with uprights, through which the main shaft passes, and extending above it to connect with a lever to give motion to the machine. Near the center of the upright a plate is attached, with a slot to receive the journal of the shaft, and is furnished with a latch or drop to hold it in place, and from the plate extends a lever connected to the frame by a hook, by which the upper cylinder is thrown over and out of the frame.

Claim.—The combination, with a box, A, of the concave formed of the wires D and frame C, the rubber formed of wires F and disks E, the shaft G, and slotted bars I provided with the lateral arms connected to the frame C, substantially as shown and described.

136,909.—*Washing-Machine.*—JOHN B. FISHER, Amsterdam, N. Y.

The beater is operated both by a lever on the shaft and by gearing attached to the shaft by another lever, that both hands may be used in different directions.

Claim.—In combination with the oscillating beater D, lever E, and shaft *e*, the gears G and F, or sections of the same, and lever H, when constructed and arranged to operate substantially as and for the purpose set forth.

136,910.—*Turn-Buckle.*—TACITUS GAILLARD, Brooklyn, E. D., N. Y.

The threaded end of one rod is inserted in the socketed end of the other rod, and the two are held together and moved one within the other by a socket-nut on the threaded rod, the socket extremity of which nut is bent inward to form a flange, that overlaps a flange on the extremity of the socketed rod.

Claim.—The nut *d*, made with a cylindrical extension, and the ring *c*, in combination with the tube *a*, flange *b*, screw *f*, and rod *g*, substantially as set forth.

136,911.—*Moth-Trap for Bee-Hives.*—LEROY GATES, Pleasant Hill, Mo.

The platform forming the base of the hive is projecting. The bees enter from this level. Deceptive doors beneath it decoy the moths, which take up their abode in a downwardly-contracting chamber below the hive, from which they may be easily removed with the hive-drippings.

Claim.—An improved combined moth trap and base or support, A, for a hive, formed with vertical end walls, the inclined sides E provided with entrance-holes D, the sliding bottom drawer, and the top C having projecting beveled ends and central opening F, all constructed and arranged as specified.

136,912.—*Mop-Holder.*—CHARLES L. HAINES, Carmel, Me.

Two jaws, the arms of which cross each other, are pivoted together, one secured in a handle, the other extended by the side of the handle, and attachable thereto by a ring and a thumb-screw.

Claim.—The arrangement, in a mop-holder, of jaws *a a'*, crossing each other and pivoted together at *b*, the said jaw below said pivot being driven firmly into the mop-handle, and the said jaw *a'* being formed into a spring lever-arm provided with a slot, *f*, in its lower end, and extending down said handle to a thumb-screw set in a ring, *g*, surrounding said handle, all said parts being constructed and operating as herein described.

136,913.—*Furnace-Block Press.*—ALFRED HALL, Perth Amboy, N. J.

The plunger-heads are adjustable to various angles by means of small wedges *m*, for the purpose of pressing irregular-shaped blocks, but are still presented squarely to the pressing power by means of changeable presser-knobs N.

Claim.—1. The combination, in a brick-machine, of changeable presser-knobs N and wedges *m*, with the plungers, for the purpose of adapting said plungers to be adjusted at various angles to each other, as and for the purpose set forth.

2. In a brick-machine, the combination and arrangement with plungers E F of rack-bars G, pinions H, shafts I, levers J, and toggle mechanism Q R S T U, as and for the purpose set forth.

136,914.—*Putting Up and Preserving Cider.*—MOSES HALSTED and JOHN L. WHEELER, Brooklyn, N. Y., assignors to HALSTED, COUES & CO., New York city.

Claim.—1. As an article of manufacture, a pure cider in siphon-bottles, charged with carbonic acid before the bottle fermentation and deposit has taken place, as and for the purpose described.

2. The process of preparing pure cider so as to preserve its good qualities by charging it with carbonic-acid gas, in the manner and for the purpose set forth.

136,915.—*Machine for Making Ox-Shoes.*—WILLIAM HAMILTON, Neversink, N. Y., assignor to himself and JAMES L. LA MOREE, same place.

The die on block A is open transversely, but closed on the other two sides. The punch or die for indenting the side of the plate is broad and flat, and has a rounded extremity; is actuated by the hammer-bar, and alternates in its movements with the hammer.

Claim.—The combination, with a trip-hammer having a socket-die or anvil, B, and a hammer-die, E, constructed as described, of a die, *c*, arranged and operating substantially as specified.

136,916.—*Attachment for Heel Trimming and Burnishing Machines.*—SAMUEL H. HODGES, Lynn, Mass., assignor to THE HODGES EDGE TRIMMING AND SATTING MACHINE ASSOCIATION, same place.

Tools for cutting, trimming, and burnishing are mounted upon a revolving cylinder or turret, with shafts running parallel to the driving-shaft through the entire length of the turret, each shaft being provided with a pinion. Any one of the tools may be brought into use by revolving the turret until it shall arrive, when its pinion meshes into the pinion of the driving-gear, when it is locked in position by means of detent-pins.

Claim.—1. In machinery for cutting, trimming, or burnishing the soles or heels of boots and shoes, a revolving tool holding turret supported in suitable bearings and carrying two or more tools, any one of which may, by rotating said turret, be brought into operative position, substantially as shown and set forth.

2. In combination with the revolving tool-holding turret arranged for operation as specified, the means herein described or their substantial equivalent, whereby the turret, after being turned to bring into position any one of its tools, may then be locked and prevented from further movement, substantially as set forth.

3. In machinery for trimming or burnishing the heels or soles of boots and shoes, the combination, with a revolving turret supported in suitable bearings, of two or more independent tool-holding shafts mounted in bearings in said turret, and capable of rotating upon their axes, substantially as and for the purposes set forth.

4. The combination, with the turret and the tool-holding shafts mounted therein and provided each with a pinion, as described, of a driving-gear, tangential, or nearly so, to the circle in which the said pinions move during the rotation of the turret, and so placed that when any one of the tools has been brought into the required position for work the pinion of the shaft of that tool will mesh with said driving-gear, substantially as set forth.

5. The combination of the revolving turret and its supporting-frame, the tool-shafts mounted in said turret, the locking-pins for holding the turret in position after its adjustment, and the driving-gear and pinions for rotating the tool-shafts, said parts being constructed and arranged for joint operation, substantially as shown and set forth.

136,917.—*Condensing Apparatus for Steam-Engines.*—JOHN HOUPT, Springtown, Pa.

The exhaust steam enters either a surface-cooler, surrounded by a cold-water jacket, or the primary jet-condenser, and, being therein partly cooled, passes to a small secondary surface-condenser, and from this through a worm-pipe in the tertiary condenser into the hot-well, from which it is drawn by the feed-pump. By circulating-pumps the sea-water is drawn into the condensers and forced out again, and the pipes are provided with suitable safety-valves.

Claim.—1. The surface-cooler A A with its circulating-pump E, safety-valve *d'*, and pipe B, the said parts being constructed, arranged, and combined to operate substantially as and for the purpose hereinbefore set forth and described.

2. The tertiary condenser F F, with the pipes 6, 7, and *f''*, in combination with the secondary surface-condenser C C, or its equivalent surface condenser, the said condensers being constructed and arranged to operate together substantially as and for the purpose hereinbefore described and set forth.

136,918.—*Jet-Condenser for Steam-Engines.*—JOHN HOUPT, Springtown, Pa.

The exhaust steam enters the condenser, and after being condensed by a jet of cold water the condense-water passes through a conical valve, arranged in the bottom of condenser and operated by a cam and lever, to the hot-well. Any uncondensed steam and air pass through the top of condenser into the chimney by a valve automatically operated by a cam, lever, and connecting-rod.

Claim.—1. The cam E, swinging arm G, and lever H, in combination with the valve B, the said parts being constructed and arranged to operate together, substantially as and for the purpose hereinbefore set forth and described.

2. The adjustable wrist-pin disk-plate I and face-plate *f'* on the shaft F, the adjustable connecting-rod K, and the rock-shaft *l''* and arms L and L', in combination with the water-jet valve C, the said parts being constructed and arranged to operate together substantially as and for the purpose hereinbefore set forth and described.

3. The crank *f''* on the shaft F, the adjustable connecting-rod O and rock-shaft N, cam M, lever P, and spring *p'*, in combination with the valve D, the said parts being constructed and arranged to operate together, substantially as and for the purpose hereinbefore set forth and described.

136,919.—*Composition Sidewalk.*—CHARLES H. HOWARD, Batavia, N. Y.

The natural earth of the walk is excavated to the depth of a few inches, thoroughly mixed with the ingredients claimed, replaced, and packed. It is top-dressed with a coat of chalk, magnesia, and water-glass.

Claim.—The method of constructing sidewalks by applying carbonate of baryta and silicate of soda to the soil thereof, as described.

136,920.—*Sealed Can.*—W. H. IRELAND HOWE, New York, N. Y.

Claim.—The thin metal foil inner cover, secured to the body of the can by a flange bent into the annular space formed by the ring E and body of the can A, as described and for the purpose set forth.

136,921.—*Distilling Apparatus.*—GASPAR HUNZIGER, Summit, Miss.

The condenser is formed by vertical pipes in pairs connected by return-bends at the top, and connecting at the bottom with a horizontal return-pipe. This condenser is connected with a second, through which the liquid to be distilled flows on its way to the still.

Claim.—1. The tanks O and pipes J combined and arranged to form condensers, as described.

2. The combination, with the series of condensers J O, the therewith connected condenser Q P, and the straight pipe L, of the supply device U V, and the vaporizer A C, all arranged as and for the purpose described.

136,922.—*Extension Attachment for Stove-Pipes.*—SAMUEL JOHNSON, James Creek, Pa.

A slotted bar is attached to the outside of one section of pipe, and in the slot a pin fixed to the adjoining section plays, so that the two sections may be adjusted on each other by means of a set-screw on the pin.

Claim.—1. The slotted bar B, the screw C, and the hand-nut D, in combination with the adjacent length A B of pipe, substantially as herein shown and described.

2. The combination of the finger-piece F with the slotted bar C, the screw D, the hand-nut E, and the adjacent lengths A B of pipe, substantially as herein shown and described.

136,923.—*Door-Spring.*—WILLIAM M. KELLIS, Chicago, Ill.

In one side of the bulb is formed a small hole having a ring or flange raised on either side, and through this hole the air is admitted and expelled slowly. The solid portions of the ends are pierced for attaching the chain or cord connecting the spring to the door and the jamb or casing. When this compound spring is drawn out by the movement of the door the coiled wire prevents the rubber bulb from collapsing, while the slowness with which the air is expelled prevents too rapid contraction, allowing the door to close gradually without slamming.

Claim.—An improved door-spring, formed by the combination of the inclosed elliptical coiled-wire spring B, having its ends embedded in the solid end parts of the rubber bulb A, with said bulb A having a hole in its side, and its solid ends perforated to receive the fastenings, substantially as herein shown and described.

136,924.—*Cotton-Harvester.*—JAMES W. LEIGH, Norfolk, Va.

A series of circular saws, arranged on a common outwardly-inclined shaft at each front corner of the carriage-box, pick the cotton from one side of two rows and deliver it into the box by clearing-brushes arranged parallel with the picker-saw shafts.

Claim.—The series of picker-saws supported in front of the receiving box and inclined outward to the rows of cotton-plants, substantially as specified.

136,925.—*Churn-Power.*—WILLIAM A. LEWIS, Springfield, Vt.

Improvement in churn-power, consisting, first, of a clutch by which two gear-wheels are fastened so as to revolve together; also, in the method of confining the wheels to the arbor; and, furthermore, the arrangement of the several parts, by which one wheel may be detached from the arbor and placed upon a stud so that the two wheels will mesh together and increase the motion of the dasher.

Claim.—1. The clutch M, or its equivalent, in combination with the gear-wheels, when the said wheels are employed as and for the purposes described.

2. The groove F, as and for the purposes described.

3. The combination and arrangement of the changeable wheels E and I, arbor C, stud N, clutch M, grooves F and K, and pins G and L, as and for the purposes described.

136,926.—*Machine for Turning Bags.*—JOSEPH MARTIN, New York, N. Y.

The bag to be turned is drawn over the receiving-arms, the turning-arms descend, engage the bottom of the bag extended from roller to roller, and in their further descent turn the bag, and at the same time the arms are spread, opening the bag. The bag is inserted between the tapes and roller, is moved along over the fly, and by it is deposited where desired.

Claim.—1. The grooved and stationary receiving-arms D D, the reciprocating turning-arms E E provided with inclines *e'*, the spring F, and bar *b'*, arranged to operate as specified.

2. The combination of the tapes M and rollers L N O P Q R with the receiving-arms D and turning-arms E to take the bags from the arms E and deliver them to the fly S, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the gear-wheel T, rack U, cam V, spring W, and wheel X with the fly S and tape-roller L, substantially as herein shown and described, and for the purpose set forth.

136,927.—*Molder's Pot or Ladle.*—JAMES MCLEARY, Martin's Ferry, Ohio.

Claim.—As an article of manufacture, the pot A, provided with the dross shield or guard E, substantially as herein specified.

136,928.—*Wheel for Vehicles.*—MICHAEL MCNALLEY, Houston, Tex.

Claim.—The metallic bands B B and flanges D D, connected by bars C and combined with a wooden hub slotted to receive spokes and longitudinally grooved to receive said bars C, as and for the purposes described.

136,929.—*Washing-Machine.*—WILLIAM E. MILLIGAN, McKinney, Tex.

A washing-machine constructed with a rubbing-board with fluted rolls, between which is attached a bucket by which water is conveyed to the upper portion of the wash-board, and is attached by rods leading from it to a cross-head connected with the levers by which motion is given to it.

Claim.—1. The rubber block formed by the combination of the rollers G and bucket H with the block F, substantially as herein shown and described, to adapt it to operate in combination with the inclined wash-board *a'*, as and for the purpose set forth.

2. The combination of the rods E, equal-armed levers D, and pivoted lever C with the rubber F G H, inclined wash-board *a'*, and box A, substantially as herein shown and described, and for the purpose set forth.

136,930.—*Balloon-Advertiser.*—ELHANAN LE BURTON MOODIE, New York, N. Y.

The sign—transparent letters on a cylinder—is suspended by a balloon and illuminated by burners from a spiral gas-pipe, which coils about the rope.

Claim.—1. The combination of the balloon A, advertising-cylinder B, and rope or cord *g*, substantially as and for the purpose herein specified.

2. The advertising-cylinder B, when composed of the wheels or forms *c c c*, constructed as described, and cloth or equivalent covering *e*, in combination with the rope or cord *g*, substantially as and for the purpose herein specified.

3. The combination of the spiral gas-pipe *k*, burners *h h*, and rope or cord *g*, substantially as and for the purpose herein specified.

4. The combination, with the gas-pipe *k*, burners *h h*, and rope or cord *g*, of the flexible pipe *p*, for the purpose herein specified.

5. The combination, with the gas-pipe *k*, burners *h h*, and rope or cord *g*, of the electric conducting-wire *i*, for the purpose herein specified.

136,931.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Perforated cylinders, having brushes attached to their outer surface, are arranged below the boiler and parallel to the track. These cylinders are caused to revolve by gearing with the main wheels of the machine. Steam is conveyed from the boiler to these cylinders and discharged upon the snow.

Claim.—In a snow-melting machine, a series of perforated revolving cylinders, constructed and operating substantially as herein described, and made either with or without brushes, as set forth.

136,932.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Claim.—1. In a snow-melting machine, the combination of the air-heating apparatus, conducting-tubes, and blast-fans with the perforated tank or distributer located underneath the apparatus and between the wheels, substantially as and for the purpose described.

2. The devices described for imparting motion to the blast-fans, in combination with the air heater, conduction-pipes, and tank or distributer, all substantially as and for the purpose specified.

136,933.—*Bee-Hive.*—JOSEPH NEWMAN and NOAH BROWN, Rossville, Ill.

A bee-hive, in which lower entrance is provided with slides so arranged that it may be contracted vertically as well as horizontally for excluding robber bees and preventing the escape of the queen.

Claim.—The slides or gates *g* and *h* applied to the hive-entrance *e*, to permit the contraction of the same vertically as well as horizontally, as and for the purpose specified.

136,934.—*Acid-Pump.*—FRANCIS NICHOLS, New London, Conn.

The pump is made of glass and may be converted into a siphon by the application of an extension tube to the nozzle. Action is produced by the compression and rarefaction of air in a chamber between the valves, the air being compressed in the chamber by a

hollow collapsible bulb, and rarefied by expanding into the bulb again. The nozzle of the bulb is fitted to a tube so as to slide along it, and a hole is made in the tube, to be uncovered when the bulb is moved upward to admit air for destroying siphonic action, for which the pump is adapted by the application of the extension tube.

Claim.—1. An acid-pump consisting of the chambered bulb A, valves G, collapsible bulb K, and pipe-connections B F, combined substantially as specified.

2. The arrangement of the bulb K on the tube L to slide over the hole O and back, substantially as specified.

3. The angle band Q provided with a lip, R, and applied to the parts A and E for connecting the same, as specified.

4. The nozzle E F projecting downward into the enlarged chamber of the bulb A, below the suction pipe L, and provided with a downwardly-seated valve, as shown and described.

136,935.—*Construction of Bridges.*—SAMUEL B. B. NOWLAN, New York, N. Y.

The bridge is constructed of metallic "voussoirs," so called, made by casting frames of iron around plates of corrugated iron or semi-steel, forming hollow rhomboidal boxes. These are hung upon each other in succession by means of the projecting hooks and corresponding sockets formed in the inclined ends; the shallow space which receives the hooks being afterwards filled with fusible metal through the opening E, thus sealing the joint. A similarly-constructed piece, but of different form, anchored to the pier forms the starting-point.

Claim.—1. The voussoirs formed by casting frames A around vertical parallel plates D, and provided with lock flanges or hooks B and sockets C upon their opposite inclined ends, substantially as herein shown and described.

2. The holes E and passages F in the frames A, in connection with the lock-flanges B and sockets C, substantially as herein shown and described.

3. The vertical connecting-plate G and inclined crown-plates H, provided with sockets C and holes and passages E F to adapt them to receive the abutting voussoirs, substantially as herein shown and described.

136,936.—*Excavator.*—BENJAMIN A. OLIVER, Bunker Hill, Ill., assignor to himself and A. M. COX, same place.

The revolving excavator or bucket-wheel derives motion from the ground-wheel, (brought into play by a lever,) which also actuates, through intermediate mechanism, the transversely-reciprocating frame carrying distributing-plates. The buckets have hinged sides, which are kept closed during the elevation by guides until they arrive directly over the distributing-platform, when they are allowed to separate by the weight of the inclosed earth which they discharge. The reciprocating frame carries it off at the sides. A caster-wheel supports the forward end. This is raised and lowered by a lever, and is fixed in position by spring-latch.

Claim.—1. The arrangement of the wheels A and axle B, bars C, and frame D E G H with each other, substantially as herein shown and described, to adapt the working-parts of the machine to be raised and lowered, as and for the purpose set forth.

2. The combination of the rack-bars K and pawls J with the axle B and carved bars H of the frame-work D E G H, substantially as herein shown and described, and for the purpose set forth.

3. The toothed rim or ring T, guide rollers U, dirt-boxes V, whether made with movable sides or bottoms, and the stationary scoop X, in combination with the frame-work D E G H, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the driving-wheel N, chain-wheel O O, endless chain P, and gear-wheel S with the toothed rim or ring T that carries the dirt-boxes V, and with the frame-work D E G H, substantially as herein shown and described, and for the purpose set forth.

5. The combination of the stationary guide W with the dirt-boxes V, toothed rim or ring T, and frame-work D E G H, substantially as herein shown and described, and for the purpose set forth.

6. The stationary trough Y and sliding frame Z, provided with hinged valves or plates A', in combination with the toothed rim or ring T, dirt-boxes V, and frame-work D E G H, substantially as herein shown and described, and for the purpose set forth.

7. The combination of the caster-wheels L', standard M', pivoted lever N', and spring-catch Q' R' S' with the forward end of the frame-work D E G H, that carries the operating-parts of the machine, substantially as herein shown and described, and for the purpose set forth.

8. The combination of the cord T', sliding clutch-drum U', and lever V' with the lever N', and with one of the guides that carry the toothed rim or ring T, substantially as herein shown and described, and for the purpose set forth.

9. The combination of the cords B', wheels C', gear-wheel E', toothed rack F', connecting-rod H', crank I', and gear-wheel K' with the gear-wheel S that drives the toothed rim or ring T, and with the sliding frame Z A', substantially as herein shown and described, and for the purpose set forth.

136,937.—*Medical Compound.*—JOSEPH L. PUTEGNAT, Brownsville, Tex.

Essence of Jamaica, pure glycerine, simple sirup, fluid extract Amargosa root.

Claim.—The above-described medicinal compound, substantially as set forth.

136,938.—*Safety-Valve.*—GABRIEL J. RAINS, Aiken, S. C.

An inverted cone-valve made to cover and partly inclose the end of the escape-pipe, the cone forming an angle of ninety degrees. On account of the inclination of its outer side the steam has no power to force it back upon its seat.

Claim.—The inverted cone-valve V, made to cover and in part inclose the end of the escape-pipe *b*, the elements of the cone forming an angle of ninety degrees or less, when constructed and arranged as set forth.

136,939.—*Grindstone Trough and Support.*—CHARLES P. RICHARDSON, Groveton, N. H.

Claim.—1. As a new and improved article of manufacture, the grindstone-trough B, constructed substantially as described.

2. In combination with a grindstone-trough, the hanger or bracket G, arranged to support the stone and secure the trough, as described.

136,940.—*Harvester.*—RICHARD A. ROBERTS, Salisbury, Mo.

The horizontal and elevating slats, between which the teeth move, are jointed on a line with the joint of the platform, which is sustained by a shoe at its outer and inner ends.

Claim.—The parallel slats E, jointed or hinged, and arranged in pairs, in combination with the jointed or hinged finger-bar A, grain-divider B, shoe C, and toothed belt or belts I J, substantially as herein shown and described, and for the purpose set forth.

136,941.—*Stone-Puller.*—GEORGE SPRINGER, No. th Leverett, Mass.

Claim.—The chain-drums D, ratchet-wheels E, pawls F with their crank-rod G, and pawls K with their double lever L, in combination with the pivoted arm J, draft-chain N, and extension tongue P Q, substantially as herein shown and described, and for the purpose set forth.

136,942.—*Rice Huller.*—MILTON E. STACY, Thomasville, Ga.

Rice fed into groove of bed and hulled by roller-wheels passing over it, the brush leveling it in the path of wheels and the scraper throwing back any rice forced out of the groove by the wheels.

Claim.—1. The combination, with the mortar A having the ring-groove *a'* with its inner side inclined toward the center, of the scraper G, as and for the purpose described.

2. The brush H, arranged to rotate over the bed *a'*, as and for the purpose described.

3. The combination, with arm F that holds the brush H, of pivoted rod I, rod J, sleeve K, lever L, and rod M, applied substantially as and for the purpose described.

4. The combination of the arm or arms F and brush or scraper G with the bed A, shaft C, arms D, and wheel E, substantially as herein shown and described, and for the purpose set forth.

5. The combination of the brush or scraper H with the bed A, shaft C, arms D, and wheels E, substantially as herein shown and described, and for the purpose set forth.

136,943.—*Treating Offal and in the Manufacture of Fertilizers.*—JACOB J. STORER, Boston, Mass.

Improvement on Patent No. 135,383 by adding a combustion-chamber.

Claim.—1. The combustion and radiating chamber, constructed in the manner and for the purposes substantially as described.

2. The combination of the fire-places, lined cylinder, and combustion and radiating chamber, in the manner and for the purposes substantially as described.

136,944.—*Machine for Sawing Laths.*—JOHN M. STOWELL, Milwaukee, Wis.

Adjustable guides upon the feeding-table allow bolts of different widths to be fed into the machine, when they are automatically carried forward and discharged from the machine by a system of toothed feed and pressure rolls.

Claim.—The table provided with self-adjusting gage-bars, serrated feed-rolls, and pressure-rolls L K with their operative mechanism, in combination with the gang of circular saws and receiving-table Z, substantially as and for the purpose set forth.

136,945.—*Lubricating Compound.*—ETHAN A. TONNER, St. Louis, Mo.

Tallow and oil or similar oleaginous substances, three pounds; Tripoli, two pounds; lamp-black, one ounce.

Claim.—The above described lubricating compound, substantially as specified.

136,946.—*Box Slide for Ornamental Chains.*—OSCAR J. VALENTINE, Newark, N. J.

Claim.—In combination with a watch-chain, necklace, or bracelet, the box-slide having the longitudinal grooved pieces A, cross-bars B, and binding-springs D, arranged to bear edgewise upon the chain, substantially as described.

136,947.—*Floor-Timber Support.*—THEODORE VORLCKER?, Boston, Mass.

The wall-plate is designed to afford a secure support for floor-timbers, which shall not weaken the wall, and in case of breakage or fire will permit the timbers to turn upon the stud-plate without doing other damage.

Claim.—The plates A B, the plate A having a transverse groove, *a*², formed upon the upper side of one or both ends, and the plate B having a corresponding transverse projection formed upon the under side of its outer end, substantially as herein shown and described, for the purpose of supporting floor-timbers and connecting them with the walls, as set forth.

136,948.—*Furnace for Steam-Boilers, &c.*—JAMES WESTERMAN, Sharon, Pa.

A hollow metallic suspended wall connected with the feed-pipe and the steam-space of the boiler to heat the feed-water is combined with the hollow bridge-wall, which is perforated at its rear side to admit air to the combustion-chamber, to assist in the combustion.

Claim.—1. The hollow metallic wall or chamber H, filled or supplied with water, in combination with the hollow bridge E having air-passages, substantially as and for the purpose specified.

2. The hollow metallic wall or chamber H, supplied with water, in combination with the bridge E, fuel-chamber D, and combustion-chamber G, constructed and arranged substantially as and for the purpose specified.

136,949.—*Air-Tight Tin-Can.*—JAMES W. WRIGHT, New York, N. Y., assignor to W. H. I. HOWE, same place.

Claim.—1. The tin-foil top B, in combination with a can for preserving fruits, &c., air-tight, substantially as shown and described.

2. The foil cover B, in combination with the cover C and can A, as shown and described.

3. A tin can provided with an air-tight top beneath the cover C, as shown and described.

136,950.—*Apparatus for Tapping Water-Mains.*—WILLIAM YOUNG, Easton, Pa.

The drill is entered through a divided case, which is taken off after the main has been tapped and the pipe screwed in. A cock placed in the line of division, but at right angles to the drill, is turned when the drill is partly withdrawn to stop the flow of water through the top. Some is allowed to escape, however, through an opening in the side to wash out the cuttings.

Claim.—The case A B provided with notched cock L N, the drill E, the packing F, the washer G, and the gasket I, combined, constructed, and arranged as and for the purpose set forth.

136,951.—*Truss Bridge.*—JAMES ANDERSON, Gouverneur, N. Y.

Improvement on the Howe-truss bridge. The saddle-pieces form a seat for the cross-girders. The truss-rods, bars, and clamps, as combined, co-operate to tie the structure together so as to conduce to strength and lightness.

Claim.—1. The top chords, constructed substantially as described, with the clamps E, in combination with truss-rods C, as described.

2. The combination of the truss-rods C with bars *b*, constructed as described, and forming the bottom chord B.

3. The saddle-pieces I, in combination with prisms D and cross-girders K, substantially as and for the purposes set forth.

4. The combination of top chord A, bottom chord B, clamps E, saddle-pieces I with other parts of framing of a Howe-truss bridge, substantially as and for the purposes set forth.

136,952.—*Pipe for Gas, Water, &c.*—ELIJAH H. AUSTIN, New York, N. Y.

The pipe is provided with a series of passages, each of which is lined with glass or other vitreous material and separated from the other passages by an intermediate layer of cement, so that each passage is insulated from the remaining passages and from the surrounding solid or fluid substances while conducting a series of telegraph-wires under ground, and so that the fluid passing through it will not come in contact with the metallic parts of the pipes.

Claim.—A pipe, P, provided with a multiplicity of passages, each of which is lined with glass or other vitreous material, and separated from the remaining passages and from the shell B by an intermediate layer, C, of cement or other suitable material, substantially as shown and described.

136,953.—*Match Composition.*—JAMES F. BABCOCK, WILLIAM A. LEONARD, and EDWARD B. CRANE, Boston, Mass.

Dissolves collodion cotton in ether and alcohol, and mixes with the solution gum copal, camphor, and olive oil. Dips a plate repeatedly, into the composition till there is deposited upon it a sufficiently thick coating. This is peeled off and cut into strips, which are pressed into molds so as to make one side serrated. A friction-match composition is applied to one side of the strip.

Claim.—1. A match composition, consisting of pyroxyline, (pure or mixed,) having applied to the whole or a part of its surface an ordinary friction-match composition.

2. The fuse-strip or match, made of composition and formed into shape by molding, substantially as described.

3. The composition fuse-strip, molded with serrations, substantially as described.

136,954.—*Punching-Machine.*—ROBERT BAIRD, Stirling, Scotland.

The eccentric head of the lever has its axis of rotation between two rolls, which, as said lever is moved by the screw, roll in contact with it and against the inclined face of the frame above and the concave head of the punch-stock below.

Claim.—The combination of the lever-piece 5 with its varying diameter and upper and lower lever-pieces 4 and 6 with the right and left hand screw-spindle 10 passing through lever-arm 9 and stationary arm 11, all constructed, arranged, and operating substantially as described, for imparting a reciprocating motion to the punch 8, as set forth.

136,955.—*Gridiron.*—ACHILLE BATAILLE, New York, N. Y.

The parallel end wires on each side project beyond the rear of the frame, and the loops so made in the lower and upper halves of the gridiron are connected by metallic straps. By these means secure hinges are made.

Claim.—The gridiron made with the loops *e* at the back of the bar *b* of the wire forming two of the parallel bars *a a*, and said loops being united by the metallic straps *d d* forming the hinges, as set forth.

136,956.—*Chair.*—JACOB BAUGHMAN and BENNET R. CHALK, Mount Washington, Md.

To the top of the rear of the seat is attached a metallic plate having an upright stop and a perforated vertical lug, which has a pivotal connection with the bifurcated plate attached to the back post of the chair. These plates are used on both sides of the chair. Slotted arms are pivoted to the chair-back. The slots on the lower ends of the arms slide over bolts entering the chair-seat, near the front, and lever-nuts hold the arms in the desired position to adjust the back.

Claim.—1. The chair-back rounds *d d* provided each with a plate, C *c*, and combined with seat A having the plate B provided with stop *b* and perforated lug *b*¹, as and for the purpose described.

2. The spring F, slotted arm G, and lever-nut H, combined with a chair having a pivoted back, as and for the purpose set forth.

136,957.—*Glass-Furnaces.*—EDWARD BAYARD and BENJAMIN A. MASON, New York, N. Y.

Two pipes coil around the furnace, of cylindrical or other shape, from which project small pipes or tubes toward openings made at intervals in the walls of the furnace; said pipes are one above the other. Through one pipe gas flows, issuing from its projecting tubes; is ignited and the heat intensified by uniting with an air-blast forced through the other pipes and tubes.

Claim.—1. In a glass-furnace, the air-pipes C and *c*, in combination with the gas-pipes B and *d*, extending only to the exterior walls of the furnace, as and for the purpose set forth and described.

2. In a glass-furnace, the openings *a*, when placed in its walls and used in combination with air-pipes C and *c*, and gas-pipes B and *d*, or their equivalents, substantially as and for the purpose set forth and described.

136,958.—*Car-Coupling.*—WILLIAM E. BYMAN, Portland, Me., assignor of two-thirds his right to MICAH SAMPSON, same place.

Devices for changing the draw-bars of a car to different heights, so that they may correspond in height to the draw-bars of cars to which they are to be coupled.

Claim.—The combination of the draw-bar, lever *m*, ratchet *p*, spring *l*, and stirrup-irons *j* and *k*, all in the manner and for the purposes as set forth.

136,959.—*Extension Table for Sewing-Machines.*—JOSEPH BENNOR, Philadelphia, Pa., assignor of one-half of his right to JOHN N. MCLEAN.

The cover is used as an extension to the table, being connected to the side of the table by a sliding rod provided at its inner end with two studs, which engage with a notched block on the under side of the table, and at its outer end with a hook and arm. The hook engages with an eye-plate on the side of the cover, and the arm bears against the side of the cover.

Claim.—In combination with the sewing-machine table, provided with the notched block *e*, the rod B, provided at its inner end with the studs *m* and *n*, and at its outer end with the hook *g* and arm A, when arranged as described, for the purpose of locking the cover to the end of the table, as set forth.

136,960.—*Process for Using Anthracite-Coal Dust or Slack as Fuel in Locomotive-Boilers.*—ALFRED BERNEY, Jersey City, N. J.

Divide tender into two parts, one for bituminous coal, other for anthracite dust. Fire up engine in usual manner with bituminous coal. When heat has reached one hundred pounds pressure, add anthracite dust. Proportions of bituminous coal and anthracite dust to be regulated by speed required.

Claim.—The improved process herein described for using anthracite-coal dust or slack as fuel to make steam in locomotive-boilers, the same consisting in adding bituminous coal and anthracite-coal dust to the fire under a locomotive-boiler, substantially as described, so as to utilize anthracite-coal dust in generating steam, as set forth.

136,961.—*Corn-Planter.*—DAVID G. BOARDMAN, Albia, Iowa.

The shares are changed in their angle by means of a curved wedge-shaped slotted block interposed between them and the standards. The seed-slide has grooves upon each side of the seat upon which it rests, to prevent the clogging of the seed.

Claim.—1. The combination of the corn-box H, bar *d* with inclined sides and grooves *i*, and the slide J with adjustable plate *f* and collar *g*, said slide being operated by the lever K, rod *h*, spring *m*, and crank-lever L, substantially as and for the purposes herein set forth.

2. The combination of the plow G, concave standard E, and convex bar *a* with longitudinal slots, substantially as and for the purposes herein set forth.

136,962.—*Combined Chair and Lounge for Invalids.*—DAVID G. BOARDMAN, Albia, Iowa.

A back frame, having rack-bars working on pinions on the main frame, and connected to the back of the chair by pivoted bars, is drawn out, and thereby the inclination of the back is adjusted. The leg-rest frame is also provided with rack-bars working on the pinions attached to the front of the main frame. Under the opening in the seat a box is supported, being hinged at one end and held by a bolt at the other.

Claim.—1. The toothed frame D, pinion *d*, connecting-bars *a a*, and back C, constructed and arranged as and for the purpose set forth.

2. The toothed frame E and its pinions or wheels *d'*, in combination with the seat A and movable or adjustable back, as and for the purpose set forth.

3. The box I hinged to the chair-frame beneath the seat, said box being supported or held in position and used as and for the purpose specified.

136,963.—*Permutation Lock.*—EDWARD W. BENTZELL, New Haven, Conn.

The oscillating tumbler is arranged to turn upon a tubular stud attached to the lock-case, and serves to operate the sliding bolt, and also to hold it in position when locked. The fence-lever, gear-wheels, and the disconnecting-lever that supports the revolving disk-tumblers are all mounted upon and move with the oscillating tumbler. The operating-shaft has a longitudinal as well as a rotary motion, and upon its inner end is secured a carrier-wheel which has an engaging-pin, by means of which the gear-wheels are picked up and revolved, the gear-wheels imparting their motion to the revolving tumblers, so that they may be properly adjusted for locking and unlocking the lock.

Claim.—1. The carrier-wheel F, having an unbroken periphery around its inner face and the recess f^2 and pin f'', in combination with the projection g' on the fence lever and shaft or spindle E, having a longitudinal and rotating movement, as set forth.

2. The fence-lever G, provided with the riding-lug g and projection g', in combination with the carrier-wheel F having recess f^2, and arranged on a spindle having a longitudinal movement, the parts being constructed and operating substantially as described.

3. The oscillating tumbler C, carrying the rotating tumblers I, wheels H, and disconnecting-lever K, or its equivalent, substantially as and for the purpose specified.

4. The combination of the oscillating tumbler C, rotating tumblers I, wheels H, fence-lever G, and disconnecting-lever K, the whole being arranged to oscillate upon the stud m in the manner described.

5. The elements of the preceding clause, in combination with the bolt B, as and for the purpose specified.

6. The fence-lever G, provided with lug g, projection g', and fence g'', as and for the purpose specified.

136,964.—*Wrench and Bolt-Cutter.*—PETER BROADBOOKS, Batavia, N. Y., assignor of one-half his right to SCHUYLER LOZIER and EDWIN F. WHITNEY, same place.

The head B′, being recessed, is used as a wrench to tighten up the nut. The head A′ is then used to trim off the end of the bolt.

Claim.—The combined wrench and bolt-cutter herein described, consisting of the levers A and B, cam-head A′, and wrench-head B′, provided with notches and offset, substantially as specified.

136,965.—*Baling-Press.*—HENRY K. BURNETT, Poughkeepsie, N. Y.

The doors are closed and power is applied to the windlass, which draws down and inward the ends of the curved arms, the curved side acting as a lever in forcing the arms or levers upward, and this upward movement of the levers, acting on the short levers e, moves them upward, carrying the follower with them until they rest against the side of the body or box.

Claim.—1. The combination of the three levers c e i, the short one e having its end attached to the side of the frame so as to exert a direct pull upon the follower, substantially as shown and described.

2. A press in which the various parts are arranged and combined substantially as specified.

136,966.—*Iron Fence.*—CLARK T. BUSH, Oneonta, N. Y.

Ornamental pickets are hung by means of lugs to the horizontal rails. Said pickets have wings extending laterally on the horizontal bars with ends clamped to the rail by couplings having flanges which force the pickets outward from the rails. The rails are held to the posts by a bent strip held above and below by a band, the post-cap forming the upper band.

Claim.—1. The rail R secured to the post T by means of the iron loop L, band b, and cap C, substantially as shown and described.

2. The couplings G G provided with flanges on each side to fit snugly under the wings W W of the pickets and acting in combination with the embracing projections S S of the pickets P P and the rail R, substantially as shown and described.

136,967.—*Machine for Folding and Measuring Cloth.*—ALONZO M. CHENEY, Charlotte, Mich.

Claim.—In combination with the ordinary folding and measuring rollers of a cloth folding and measuring machine, the hinged tray T provided with an adjustable gage, V, the rollers r r, and bars s s, and adjustable gage G arranged between the rollers and bars to guide the cloth, and all constructed and arranged as described.

136,968.—*Fruit-Crate.*—WILLIAM H. CLARKSON, Bridgeville, Del.

The device is for a fastening for the lid of the box or crate by a belt formed of wire, bent at the upper end to form a hook, which, by turning, enters a staple attached to the lid, and extending down is secured by staples, and has a lug operating against a spring to hold it in position, and its lower end bent at an angle, by which it is operated through the slats of the crate.

Claim.—The fastening D, constructed as described, with handle c, lug d, and arm e, and used, in combination with the spring K and staple G, on the inside of a berry box or crate, substantially as and for the purposes herein set forth.

136,969.—*Lawn-Mower.*—THOMAS COLDWELL and GEORGE L. CHADBURN, Newburg, N. Y.

A spiral revolving cutter has its bearings in hinged arms, which are adjusted to and from the stationary cutter by set-screws, which turn between fixed lugs on the sides of the frame.

Claim.—1. The means employed for rendering the revolving cutter adjustable toward or from the bed-knife, consisting of the pivoted bearings E, provided with the threaded lugs E′, the screws G, working in said lugs, and the lugs H, secured to or upon the frame A, and embracing the ends of said screws, substantially as set forth.

2. The cutter-heads M, having their peripheries reduced in front of the cutters, and their edges chamfered, in the manner and for the purpose substantially as shown and described.

3. The handle shown, consisting of the sides P and cross-bar p, formed of one piece, and combined with the frame sides A and bar Q, substantially as and for the purpose specified.

136,970.—*Washing-Machine.*—CONVERSE COLE, Meriden, N. H.

A washing-machine constructed with metallic non-corrosive plates covering the sills, with cleats for attaching it to the tub connected with the uprights, which may be adjusted to the size of it, the upper roll being corrugated and working on plain ones for rubbing.

Claim.—In combination, the guard C′, made of thin plates of non-corrosive metal, the sills C, cleats H I, standards D, springs E, fluted cylinder A, and bed-rolls B, all constructed and arranged substantially as and for the purposes set forth.

136,971.—*Glass-Mold for Forming Lamp-Chimneys.*—MICHAEL H. COLLINS, Chelsea, Mass.

In the sections of the stationary mold, at the top and bottom, segmental knives or creasers are fixed for giving one uniform size to the chimneys as they are blown, by partially severing them at such points, the surplus glass being then easily removed without fracturing the chimney.

Claim.—In a stationary glass-mold for making lamp-chimneys, formed in sections as specified, the arrangement of one or more fixed segmental creasers or knives in each section, in manner as shown and described.

136,972.—*Device to Prevent Retrograde Motion of Balance-Wheels on Sewing-Machines.*—GEORGE W. COOK, Chicago, Ill., assignor of one-half his right to HARVEY T. WEEKS, same place.

Device to prevent retrograde motion of balance-wheel on sewing-machines.

Claim.—The pulley c, cord m, and lever h, in combination with the arm l and dog n, substantially as and for the purposes hereinbefore set forth.

136,973.—*Medicine-Case.*—WILLIAM H. CUTLER, Buffalo, N. Y.

Two holes are bored side by side in a solid wooden block. A metallic cover slides over one end, and is guided by flanges which run in grooves cut in the wood just below the edge. A small struck-up metallic stop serves both to limit the motion of the cover and to retain it in position. This box and cover, composed of two pieces only, is for carrying an inhaler and bottle of medicine, and is, from its construction, of such strength that the bottle would not be broken when the case is carried in the pocket or in a trunk.

Claim.—The improved medicine case or box formed of the solid wooden block A having the longitudinal openings a a and the sliding sheet-metal cover B therefor, provided with the flanges d d fitting in grooves c c, and with the stop and thumb-piece e, as shown and described.

136,974.—*Door-Spring.*—SPALDING CUTLER, Cincinnati, Ohio, assignor to himself and HUGH MCCONNELL, same place.

A helical spring coiled around a rod, and adjustable by a nut to regulate tension, is pivoted at one end of the rod to the jamb or casing, and carried, at or near the other end, by a b acket on the door. This device is provided with an eccentric-lever cam arranged upon and working in a slotted bail on the bracket, which acts as a brake to press down upon the rod and suspend the action of the spring, thus holding the door at any angle or in desired position.

Claim.—In a door-spring of the character described, the combination of the rod A, slotted bearing C i, and cam G g, substantially as and for the purpose specified.

136,975.—*Railroad Snow-Plow.*—WILLIAM DAVIS, Five Corners, N. Y.

The snow is divided by the revolving cutters, and then carried up the inclined plane by means of an endless band. It then falls upon another endless band which runs at right angles to the inclined plane, and thereby conveyed to the sides of the track. The cutter and endless bands are revolved by their being connected, through intermediate gearing, to gear-wheels which are attached to the car-axles.

Claim.—The breaker c, incline platform U, belts W O with shovels V and P attached thereto, in combination with the incline frame A, driving-wheels B B and C C, pulleys S T N N′ G F, gear-wheels D E I J P Q R K M, bevel-gear wheel g h i, and boards u and u, substantially as and for the purpose hereinbefore set forth.

136,976.—*Sewing-Machine.*—ALFRED S. DINSMORE, Boston, Mass.

The loose pulley, which, by frictional contact with the fast pulley, drives the machine, is moved on the main shaft between the fast pulley and the fixed collar provided with an arm. When the long arm of the rocker is depressed the pulleys are engaged, but when allowed to rise under the action of the spring the loose pulley is moved back against the collar, and the stop on the rocker is brought under the arm on the collar, and the machine is stopped preferably with the needle always in its highest position.

Claim.—The rocker k provided with the arms l and m, shoe n, stop r, and a reacting spring, combined with the collar and its arm q, the friction-hub x, and the fast and loose pulleys h k, and shaft b, substantially as and for the purpose described.

136,977.—*Suspension-Ring.*—GEORGE DOOLITTLE, Bridgeport, Conn., assignor to THE DOOLITTLE MANUFACTURING COMPANY, same place.

The device is constructed of a continuous piece of wire, all the corners or angles of the suspension portion being rounded. The penetrating-points are formed at right angles to and below the lower plane of the circle forming the ring. The points are barbed, one being longer than the other and bent over it.

Claim.—1. As a new article of manufacture, a suspension-ring formed of a continuous wire, with the penetrating-legs terminating at right angles to and below the lower plane of the circle forming the ring proper, as and for the purpose set forth.

2. In a suspension-ring composed of wire or its equivalent, the penetrating-points, arranged substantially as described, so that the lower one shall be wholly or partially covered by the upper, as and for the purposes set forth.

136,978.—*Elevator.*—CHARLES DU BOIS, Fishkill Landing, N. Y.

Improvement in elevators, to enable the weight of articles which are to be transported between an upper and a lower point to be wholly or in part counterbalanced, so as to lessen the amount of power required to withstand or overcome the force of gravity, and consisting of self-balancing carriages provided with reservoirs for the reception of water, in combination with suitable apparatus for supplying said water to said reservoirs at points within the tracks of said cars, and for receiving the same from said reservoirs at other or higher points.

Claim.—Two self-balancing carriages provided with reservoirs for the reception of fluid, &c., in combination with suitable apparatus for supplying such articles to said reservoirs at points within the travel of said cars, and for receiving the same from said reservoirs at other or higher points, substantially as and for the purpose specified.

136,979.—*Circular-Saw Bench.*—BENJAMIN F. DUNKLEE, Concord, N. H.

Two circular saws are hung in oscillating frames beneath the table, and are so connected as to balance each other.

Claim.—The combination, with two saw-frames arranged to counterbalance each other so that both saws may be raised and operated together when desired, of devices for fastening it in position, substantially as shown and described.

136,980.—*Cover for Coffee-Roasters.*—LODIEK J. DYKE, Hamilton, N. Y.

Claim.—The cover B provided with a handle, f, bearings g l, slot h, and the pivoted piece j having sockets k, all constructed and arranged substantially as described, for the purpose specified.

136,981.—*Rotary Engine.*—WINSLOW P. EAYRS, Boston, Mass., assignor of one-half his right to T. E. STEWART, same place.

A rotary wheel, provided with two or more circumferential steam-channels, and abutments provided with packing and friction roller, is combined with a balanced oscillating valve having a passage through it. The packing-rings are made in sections, and the roller is set out by steam admitted through a passage in the side of the abutments.

Claim.—1. In a rotary engine the wheel C provided with two or more circumferential steam-channels, a, each having abutments D provided with packing and rollers e and a balanced valve, constructed to operate as and for the purposes herein set forth.

2. The packing-rings d, made in sections and placed in grooves b on the rotating wheel, in combination with the rollers e, groove i, and passages f, substantially as and for the purposes herein set forth.

3. The combination of the cylinder A, wheel C with grooves a and b, packing-rings d, and abutments D, the valve-boxes E G, valves I I′, pipe K, and the various ports, all constructed and arranged substantially as and for the purposes herein set forth.

136,982.—*Means of Snubbing Canal-Boats.*—THOMAS W. EDGAR, Espy, Pa.

Stout pieces of timber, intended to be used as brakes in canal-locks, are hinged at their front ends to the bows or sides of a canal-boat, and are extended laterally and outwardly by levers, which levers are operated by chains extending aft to the man at the wheel. Springs retain the brakes against the sides of the boat when they are not in use.

Claim.—1. The combination of brakes with the sides of a canal-boat, operated by any suitable mechanism for projecting them outward, for snubbing the boat in locks, substantially as described.

2. The combination of the brakes B B with the sides of a boat, the brakes being operated by means of the levers F F, chains E E and E′ E′, rods H H, and capstan J, substantially in the manner and for the purpose set forth.

136,983.—*Safety-Pocket.*—SAMUEL ENGEL, Chicago, Ill.

Two pieces of whalebone or other elastic material are secured to opposite sides of the pocket. An elastic band is attached to one strip at the ends, as a string to a bow, by which it is made to bend forcibly upon the other strip and keep the pocket closed.

Claim.—The safety-pocket herein described, consisting of the pocket A, springs a b, secondary spring c, all constructed and arranged to operate substantially as and for the purposes specified.

136,984.—*Tobacco-Package.*—EDWARD L. FELGNER, Baltimore, Md.

A tobacco-package, having a semi-cylindrical form, for convenience in carrying in the pocket. The string, which is used for tying the package, is concealed beneath the folded end until ready for use.

Claim.—1. A package or sack having when filled the form, in transverse section, substantially as and for the purposes set forth.

2. A sack or package of tobacco having its mouth closed by folding and sealing, substantially as shown and described, and concealing beneath the fold or folds a string, c, as and for the purpose set forth.

136,985.—*Balanced Valve.*—HENRY FITZSIMMONS, Houston, Tex.

Slide-valves, with opposite faces, are arranged between seats on both sides of the valves, and the sides of the valves are adjusted, as required, automatically by the pressure of the steam upon an intermediate section of wedge-shape, to insure a proper fit of the valve between its seats.

Claim.—The combination of the wedge-shaped and automatically-adjustable intermediate section B′ with the outside sections B B′ of the open body or frame-like valve, the strips m m, the screws k k, the valve-seats C C, and the ports or passages c c, c' c', d d, and f f' g, substantially as shown and described.

136,986.—*Machine for Wiring Sheet-Metal Pans.*—WASHINGTON FOGLESONG, Dayton, Ohio, assignor to himself, JOSIAH E. BOYER, JOHN MCMASTER, and ISAAC HAAS.

By a series of consecutive mechanical movements the wire is fitted to its place, and the edges of the sheet-metal pan bent entirely over it. The four sides of the pan are operated upon simultaneously.

Claim.—1. In combination with the movable table A, having the hinged wings m m for bending the edges of the metal sheet, the plunger C and its two heads D E, one, E, movable, with arms f f carrying blades G G′ for pressing the wire to its place, and one, D, stationary, for holding the pan, the whole constructed, connected, and operating substantially as and for the purpose specified.

2. In combination with the elements of the first clause, the cross-head H, carrying the corner-standards M M′, shaped and operating as described, the whole connected and operating substantially as herein specified.

3. In connection with the elements of the two preceding clauses, the slots c c' in the arms f f, and slots k k in the bars A A′, and slots j in the cross-head H, with the accompanying tightening-nuts, or their equivalents, for rendering the blades G G′ and corner-standards M M′ adjustable for different sizes of pan, the whole being arranged, connected, and operating substantially as and for the purpose specified.

4. In combination with the elements of the first clause, the toggle-joint F, bell-crank lever O, and trigger p, with the arm q, or their equivalents, for raising the movable head, arranged and operating substantially as and for the purpose herein specified.

5. In combination with the elements of the preceding clauses, the cam B′, connecting-rod C′, sliding arm J, and screw L, adjustable to the bottom of the table A, constructed and acting substantially as and for the purpose specified.

136,987.—*Cartridge-Holder.*—LEROY J. GAINES, West Meriden, Conn., assignor to CHARLES PARKER, same place.

Combination with a belt provided with a shelf or ledge of spring-clasps, the ledge to support and the clasps to hold the cartridges.

Claim.—A belt, A, constructed with a ledge, B, at or near its lower edge, and provided with independent clasps D, more or less in number, above the said ledge, substantially as and for the purpose set forth.

136,988.—*Lizard for Sails.*—CHARLES H. GALLAGHER, Gloucester, Mass.

The eye or ring, having cast with it the web and arm, has a hook pivoted to the arm and fastened to shoulder by a screw or pin, the hook and arm being constructed to form a clasp, when closed, of irregular internal form, to more securely grasp the boltrope and thimble.

Claim.—The jack or lizard formed of metal and having the eye or ring a, the web b, and the arm c cast in one piece, and the hook d pivoted to the arm c and fastened to the shoulder f by a screw or pin, g, the hook and arm being so constructed that when closed they form a clasp having the irregular curvature described, for the purpose set forth.

136,989.—*Portable Fence.*—JOSEPH E. GARLINGTON, Chambers Court-House, Ala.

The end posts are secured to the panel by upright battens, which form a hollow post. Oblique braces are stepped into the base-plank, which is also centrally notched on each side to receive and support the end upright of the post.

Claim.—The portable fence, constructed as above described, consisting of the panels having upright end posts C, the mortised and centrally-notched base-plank D, and the oblique braces E, stepped in the mortises of the base-plank, and pinned to the end posts C with battens B, which are stepped in the notches of the base-plank, as specified.

136,990.—*Knife-Cleaner.*—HORACE C. GILBERT, New London, Conn.

The machine is located in a box or platform with raised sides, and is arranged with cork blocks, fitted together to receive the article to be operated upon, and has a cap, with a handle to raise it, which is held by two uprights with spiral springs. On the top of the uprights is a bar extending across, holding the upper end of the springs and serving as a rest for the hand in using the machine.

Claim.—In a knife-cleaner having rubbing-blocks and plates with corks attached to each, in connection with posts and springs arranged and attached to a box, I claim the plates C D provided

with the hooks *h*, in combination with the bar *g* attached to the top of the posts, substantially as shown and described.

136,991.—*Boot and Shoe Shank.*—GEORGE GOODYEAR, New York, N. Y.

The shank is made from a solid piece of wood by means of saw-cuts from each end, said cuts not meeting in the center, leaving a solid part.

Claim.—As an article of manufacture, a wood shank for boots or shoes formed from a single piece of wood slit from each end toward the center, leaving a portion at or near the center solid and uncut, substantially in the manner described.

136,992.—*Extracting Tubular Casings from Oil-Wells.*—HART HARRIS, Tidioute, Pa.

The cutter is worked by the rope until the bottom of the tubing is cut or slit longitudinally, allowing it to collapse and clear the packing and the sediment usually caked above the packing.

Claim.—1. The method of removing the casing from oil and artesian wells by splitting the casing longitudinally a suitable distance to enable it to be withdrawn, substantially as and for the purpose specified.

2. The combination of the body formed with a longitudinal slot having an inclined bottom, and a block that carries a cutter or its equivalent that rests upon and is fed outwardly by the inclined bottom of the slot, substantially as and for the purpose specified.

3. The combination of the body of the implement formed with a longitudinal slot, a cutter-block provided with an inclined groove on its side, and a set-screw that takes into the groove and holds the block in place, substantially as and for the purpose described.

136,993.—*Apparatus for Shearing Horses.*—WILLIAM HARRISON, Chicago, Ill.

A supplemental plate is attached to the stationary toothed plate, underneath, to regulate the height of the shearing-edge, so that the hair upon the horse may be clipped long or short. Several of these plates are provided for each machine, and are of varying thickness.

Claim.—The combination of the movable plate C, the stationary plate A provided with lugs G, and the supplemental plate or plates H, and bolts *g*, substantially as and for the purpose specified.

136,994.—*Lantern.*—EDGAR K. HAYNES, Boston, Mass.

An inclined ring surrounding the exterior of the gallery deflects currents of air upon an impervious plate beneath the burner. The wick-tube is covered by a cone upon an open frame-work. The air, after impinging upon the impervious plate, passes partly up around the wick-tube and partly through the frame-work of the cone, the two currents mingling above the flame. Above the top of the lantern is a dished plate, and surrounding vertical ring in such relation that currents of air, striking the lantern, create a draft to withdraw any excess of air therein.

Claim.—1. An annular deflector, *g*, and perforations e^3, arranged in relation to an impervious plate, *f*, and the wick-tube of a lantern, substantially as and for the purposes described and set forth.

2. The combination of the dished top plate b^1, annular dished or curved ring b^3, annular opening b^4, and annular band b^5, all arranged in relation to each other substantially as and for the purposes specified.

3. In combination, the dished plate b^1, annular dished or curved ring b^3, annular open space b^4, annular band b^5, impervious plate *f*, deflector *g*, and lantern-globe, arranged and operating substantially as and for the purposes set forth.

136,995.—*Rat-Trap.*—THOMAS HEBB, Great Mills, Md.

The trigger of a revolving floor is so arranged over a movable bait-box that the animal is dropped into a lower prison-chamber, and the trap is reset without loss of bait.

Claim.—The trigger *r* and bait-trough, as arranged and combined with a winged wheel, C, the whole operating in the manner and for the purposes set forth.

136,996.—*Fruit-Jar.*—GEORGE W. HEMPELL, Millville, N. J.

The jar is constructed with an oval-shaped mouth, with an inner shoulder or offset a short distance below. Within this mouth, and extending above the top of the jar and below the shoulder or offset, is arranged a rubber gasket, which is provided with flanges extending outward over the top of the jar and underneath the shoulder, and serves as packing for the inner and outer caps which are forced in upon them by means of the screw, and a perfect joint is thereby effected.

Claim.—A jar with an oval mouth, as constructed, in combination with the inside cover C, rubber packing-ring D, plate G, and screw *d*, constructed as herein set forth.

136,997.—*Camera-Stand.*—BALTHASAR HOLLER, Brooklyn, E.D., N. Y.

Two or more slides arranged to move up and down in guide-slots in the legs of the camera-stand, and connected at their upper ends to the platform by hinge-joints, are controlled in their movements by weights and friction-springs, respectively, the latter being released at will by treadle mechanism, so that the operator can adjust the platform without requiring the aid of his hands.

Claim.—1. The slides B B C, constructed as described and connected with the platform A by the hinges *a b*, in combination with the legs F F G of the camera-stand, the several parts being arranged substantially as herein shown, for the purpose specified.

2. The weight *f* and spring *g*, or their equivalents, in combination with the slides B B C, platform A, and legs F F G, substantially as set forth.

3. The friction devices *c c'* and treadle of lever H connected thereto, in combination with the weights or springs *f g* and with the slides B B C, platform A, and legs F F G, substantially as shown and described.

136,998.—*Breech-Loading Fire-Arm.*—HENRY HOPPENAU, Kansas City, Mo.

Sliding cover for cartridge or charge chamber adapted to be caught and locked by a spring-catch lever for raising the catch and arrangement of the sight in a slotted handle for the cover.

Claim.—1. The sliding cartridge-chamber cover B, having the notch *b*, in combination with the spring *d* attached to the rear end to the case, and provided with pendent stud on the front end, as and for the purpose described.

2. The bifurcated lifter E, attached to slide B, and combined with spring having the headed stud d^2, as and for the purpose set forth.

3. The sight *f*, combined with and adjustable on the slotted post F of slide, as and for the purpose specified.

136,999.—*Combined Slop-Pail and Commode.*—GARDNER HOWLAND, Brunswick, N. Y.

The pail is divided horizontally by a valved partition, operated by a rod, and one side of the conical top is formed for a commode with a cover.

Claim.—1. The combined slop-pail and commode, constructed of two compartments, separated by a valved partition, and formed at top to serve as a seat, all substantially as herein set forth.

2. The partition D, separating the compartments A B, provided with a valve, E, packed around its edge, substantially as set forth.

137,000.—*Package Band and Fastener.*—FREDERIC R. HUNT, Leavenworth, Kan.

The fastener is fastened to the band by side flaps, and has end flaps *b* which form a doubled wearing-edge.

Claim.—The band and fastener herein described, consisting of the band A, attached to the fastener B by pasting down the sides *d d*, said fastener being formed with the tongues *b* and slits *c c*, substantially as shown and described, for the purpose specified.

137,001.—*Snow-Shovel.*—EDWARD HUNTER, Norwich, Conn.

A metallic tip is secured between two thin plates of metal, and these, in turn, are riveted upon both sides of the wooden blade.

Claim.—A tip or shoe for a wooden snow-shovel, consisting of a wrought or cast iron core, in combination with sheet-metal plates, substantially as set forth.

137,002.—*Gathering Attachment for Sewing-Machines.*—THOMAS S. HUNTINGTON, Baltimore, Md.

The grinding-edge of the base-plate is slotted to receive the feed-bar that carries the feeder that bears on the strip of cloth to be gathered. One end of the jointed lever rests against the feeder, the other end against the adjustable feed-regulating stop. The spring keeps one end of the feeder against the stop and the jointed lever elevated at its center. The needle works through the slot in, and the needle-bar bears on, the spring-lever, depresses the jointed lever, draws back the feeder, and as the needle rises the spring moves forward the feeder, and it makes a gather in the cloth.

Claim.—The adjustable spring-lever *m*, the jointed lever *b*, stop *c*, feed-bar *f*, feeder A, spring *i*, and plate *a*, constructed substantially as shown, for the purpose set forth.

137,003.—*Ruffling Attachment for Sewing-Machines.*—THOMAS S. HUNTINGTON, Baltimore, Md.

Employment of a hinged feeder, a spring-feeder in connection with a stationary adjustable guard, and also in the employment of a hinged bar, in connection with these devices, in place of the lever.

Claim.—1. The guard *s*, in combination with the reciprocating hinged feeder A, spring A^1, and feed-bar *f*, all constructed and arranged on the supporting-bed having the vertical guiding-face, in the manner and for the purpose substantially as set forth.

2. The hinged bar *m*, jointed lever *b*, adjustable stop *c*, feed-bar *f*, hinged feeder A, spring A^1, guard *s*, and plate *a*, all constructed substantially as set forth, for the purpose specified.

137,004.—*Leaching and Tanning Apparatus.*—CHARLES KORN, Brooklyn, N. Y.

Troughs, supported upon and surrounding the entire vat, are provided with tubular connections with the different compartments of the vat. The vat and troughs are made air-tight, and the pressure regulated by means of valves.

Claim.—1. The combination of the vessel A and of the distributing-trough D with the cover B and pipes *b d*, as set forth.

2. The cover E and trough D in combination with the vessel A, cover B, and pipes *b d*, as specified.

137,005.—*Upright Piano Action.*—RUDOLPH KRETER, New York, N. Y., assignor to DAVID DECKER and JOHN J. DECKER, same place.

A spiral spring is introduced under the hammer, but to withdraw it nimbly from the string. The action-frame is jointed in line with the pivots of the action-lift hinges, so that the whole may be turned back from the strings when desired.

Claim.—1. The combination of the spiral spring O, the upright *d*, and the knuckle C of the hammer, when these parts are arranged in relation with each other and the spring connected to the knuckle in close proximity to its center of motion, *e*, and around the latter, so as to act at a uniform leverage on the knuckle of the hammer, substantially as shown and described.

2. The arrangement, essentially as herein described, of the hammer-rail A, the rest-rail F, and the regulating-rail H, and accompanying parts of the action with the pivot or joint *c* of the base-piece of the jack, for the purposes specified.

3. The standards which support the action, constructed each of separate pieces M N, the one, M, of which is fastened to the key-frame, and the other piece, N, which carries the action, is pivoted to the fast piece M so as to turn on a center which is coincident with the center *c* of the lower jack connection, essentially as herein described.

137,006.—*Combined Fire-Plug and Cistern.*—FINLEY LATTA and WILLISON H. HUGHES, Cincinnati, Ohio.

The plug is located within a shallow cistern and has a three-way cock, arranged to admit of the discharge of water directly within the cistern when it is desired to supply one or more suction-engines, or allowed to pass upward through the top of the plug, as required. The lower end of the plug is provided with a collar, which is traversed by equidistant screws, whose points enter and rest upon a ring, which itself rests upon the top of the barrel to prevent the jamming of the plug. The handle for operating is pivoted, so, when not in use, it is turned down to admit of the cover being secured.

Claim.—1. The fire-plug, substantially as described, located entirely within a suitable cistern or tank provided with a detachable cap, the removal of which gives access to any part of the plug, and enables a supply of water to be obtained directly therefrom or from the cistern by turning the stem H, substantially as set forth.

2. The described arrangement of pivoted and folding handle L on the hollow stem H of the fire-plug, as and for the purpose explained.

3. The provision in the plug proper of collar O, having the screws P, resting upon a ring, Q, supported and revolving upon the top of the barrel, as and for the object set forth.

137,007.—*Sewing-Machine.*—WILLIAM S. LINCOLN and WILLIAM A. RAYER, Boston, Mass.

The ends of pieces of fabrics to be joined together are confined on pins projecting from the rotating guide and annular frame, which move together, firmly hold and present the material under the needle. The ends are trimmed by the rotating shears, and a marker attached to one of the cutters receives ink from the inking-rollers, and marks the fabric with any desired designating mark.

Claim.—1. The combination, substantially as described, of a rotating guide, B, and an annular frame, D, each provided with hooks or points *a a b b* all constructed and arranged to operate as herein set forth, for the purpose specified.

2. The marker L arranged on the cutter E, and in respect to inking-rollers M^2 M^3, all arranged and operating substantially as described, for the purpose set forth.

137,008.—*Pill-Making Machine.*—CHAUNCEY B. LITTLEFIELD, Manchester, N. H.

The rolling-board, provided at its front edge with a recess formed by a cleat, which projects over it. This cleat has transverse vertical slots at equal distances from each other. A spring plate is secured upon the upper side of the rolling-board, and at one end is armed with cutting-teeth, which pass between the slots in the cleat and cut the roll into separate pieces for each pill.

Claim.—The pill roller and cutter, consisting of the board or body A, provided with the spring-plate B, having the series of knives or cutters *c*, when constructed substantially as described.

137,009.—*Manufacture of Bolts and Rivets.*—WILLIAM LIVINGSTONE, Brooklyn, assignor to himself and JOHN HENRY WHITNEY, New York, N. Y.

Two cylindrical rolls, each surrounded with an eccentric and laterally-shaped band, which, at its narrow end, is flush with the surface of the roll, but rises gradually and widens as it extends spirally around, its broadest end being equal to the length of the rivet's shank between the under side of the head of one and the top of the head of the succeeding one. The edge of the band on the side where the rod is entered has a gradually-increasing bevel or scotia where the other is perpendicular, and thus, while the latter drives the head forward, it also keeps the under surface of it square with the shank while the former rounds the end of the unwrought part of the rod for the head of the next rivet.

Claim.—1. The method herein described of making rivets or bolts.

2. The combination of the rolls B and B, constructed essentially as described, with the journal-boxes, one or both of which is adjustable, and mechanism to rotate said rolls, in the manner substantially as described.

137,010.—*Rock-Drilling Machine.*—CONRAD LOHNES, Springfield, Ohio.

Claim.—1. In combination with the frame and the derrick A C, and the drill E and ropes D I, the frame F, and the windlass G with its ratchet and pawl *g* substantially as set forth.

2. In combination with the drill E and the rope D and the vibrating frame F, the rope I, spool *h*, and the clutch J upon shaft H, substantially as and for the purpose set forth.

3. In combination with the spool *h* and clutch J, and their connections to raise the drill, the clutch-lever K and cam-wheel L, as set forth.

4. A rock-drilling machine, constructed with the hinged derrick or drill-frame C, and the seat or saddle T mounted upon flexible supports *l* above the driving-wheel N, which is provided with foot-cranks *m*, whereby the operator may propel the machinery with his feet, and have his hands at liberty to manage and guide the drill.

5. The drill-frame or derrick C, and the seat or saddle T upon elastic supports, arranged as set forth, in connection with the counter-shaft H, provided with a cam or eccentric, Q, and the push-bar and ratchet R *r* to actuate the drill, as set forth.

6. A rock-drilling machine, with the following instrumentalities, arranged substantially as described—viz: A main frame, A, supported upon feet; a perpendicular derrick or drill-frame, C, erected upon and hinged to one end of said frame A; a seat or saddle, T, for the operator, mounted upon flexible supports and above the drive-wheel, which is fitted with cranks to be propelled by the feet; a cam, Q, upon the shaft of said drive-wheel; a push-bar actuated by said cam; and ropes or cords extending from shaft over pulleys *i f c* to the drill E which is thereby suspended and operated in the manner set forth.

137,011.—*Excavator.*—ASAHEL P. LOMAX, Warsaw, Ill.

The inclined wheel is attached to the bar H, which is so hinged to the frame as to permit the wheel to be adjusted to the depth of the ditch. The earth is thrown by the plow onto the flange of the wheel, and is carried up between the curved guide plates to a point opposite the plow, where it is thrown off by the plate k^4. The lugs on the under face of the wheel assist in its rotation by contact with the ground. The guide-bar is adjustable in the clevis to vary the line of draft.

Claim.—1. The inclined wheel K, having attached to its periphery the flange *k* with lugs *l* on the under side, in combination with the plow A and guide-plates k^2 k^4, substantially as shown and described.

2. The hinged bar H, supporting the inclined wheel K and provided with the wheels R and S, substantially as specified.

3. The combination and arrangement of the axle M, draft-bar N, clevis P, and the frame, constructed and operating substantially as shown and described.

137,012.—*Windmill.*—CORNELIUS P. LONG and CHARLES N. MCEVERS, Murrayville, Ill.

A series of sails are pivoted, by means of sockets attached to the sail-bars, to the spindle ends of the spokes of a horizontal wheel. The sail-bar is ballasted by a weight at its lower end, and is pivoted below the middle point of the sail. The spindles are in two parts, and both parts are provided with corresponding stops to prevent the ballasted sails from swinging back beyond a vertical position after being "bowed" forward. In an ordinary wind the sails remain upright, turning edgewise when coming up in the wind, and flatwise when facing the wind. Under a high wind the ballasting-weight is overcome, and the sail is bowed to an angular position.

Claim.—1. In a horizontally-rotating wind-wheel the sails D, hinged to the bars or heads F, holding the ballasts G, and journaled to the spindles or arms of the wheel at points below the middle of said bars or heads, substantially as specified.

2. In combination with the hinged sails D and spindles *d d'*, the ratchet or check E and stops *a b*, substantially as specified.

137,013.—*Earth Closet.*—BENJAMIN L. MACK, Essex, Conn., assignor to himself and THOMAS N. DICKINSON, same place.

Above the sliding seat is pivoted a lever, its outer end connected to the seat and to the lever a scoop is attached. As the seat is drawn out the lever is drawn forward with it carrying the scoop into the earth-chamber, receiving the required quantity of earth, and when the seat is again thrown back the scoop is also thrown back, taking with it the earth and discharging it through the opening in the seat.

Claim.—In combination with the seat A, case B, and earth-chamber C, the scoop E, arranged upon a lever or levers, D, the said lever in connection with the case and seat, and constructed and arranged to operate substantially as set forth.

137,014.—*Car-Coupling.*—FRANK W. MARSTON and OWEN JONES, Philadelphia, Pa.

As the cars come together, whether straight or at an angle, the inclined faces of the catches meet, and moving by each other, the spring yielding sufficiently to permit each hook and buffer-bar to separate from each other, slip into place and complete the coupling.

Claim.—1. The combination of the catch A and buffer-bar B, substantially as described.

2. The combination of the catches A A having recesses a^1 a^1, with the buffer-bars B B having projections *b b*, as shown.

3. The combination of the catch and buffer-bar, constructed and arranged as described, with the connecting-rods a^2 b^2, bar *c*, spring F, and lever I, as described.

4. The combination of the bar *c* having the nut H, with the volute spring F and the cross-bar G, the spring being made adjustable, as described, for the purpose set forth.

5. The combination of the slotted lever, the spring-bar *c*, and the connecting-rods *d d*, with the short arms a^3 b^3, as described.

6. In combination with a coupling of substantially the described construction, the bar, link, and hook, *x* x^1 x^2, adapted to hang down between the cars when not in use, as and for the purpose described.

137,015.—*Fishing-Rod.*—JOHN B. MCHARG, Rome, N. Y.

The rod is divided at the point where the reel is attached, and is fastened together by an encircling band; this band has a depression in which fits the reel-plate, and has the usual clamp-ring.

Claim.—In combination with a fishing-rod, the metallic reel-plate band A, having its clamp-ring *c*, substantially as shown and described.

2. In combination with said reel-plate band A, having the rings C, C^1, and C^2, a fishing-rod, divided and jointed, substantially as described and shown.

137,016.—*Burglar-Alarm.*—WILLIAM H. MCPHERSON, Nashville, Tenn., assignor to WM. A. T. GODFROY and DANL. BENNETT, same place.

A small fire-arm barrel is provided with a gimlet-screw for attaching it to a door-jamb, and the hammer is supported by a toggle-joint trigger connected by an arm or lever to the door so as to discharge the fire-arm on the opening of said door.

Claim.—1. The pivoted dog or prop *f*, jointed and arranged to operate as described, for the purposes specified.

2. The extensible and articulated trigger or tripping-lever *g*, constructed and arranged as described, in combination with the pivoted dog or prop *f* and hammer *d*, for the purpose set forth.

3. The improved burglar-alarm and animal-trap gun, composed of the barrel *a* and the nipple *b*, supporting-screw *c*, hammer *d*, spring *e*, dog or prop *f*, and trigger or tripping-lever *g*, constructed and combined substantially as herein described, for the purposes set forth.

137,017.—*Wheel for Vehicles.*—SAMUEL J. MILLER and LUNA WRIGHT, Economy, Ind.

Tubular spoke-sockets form braces to the sides of the hollow metallic felly, which also has transverse braces connecting its outer edges.

Claim.—The hollow metallic felly A, having the elongated spoke-sockets B and transverse braces D, constructed and arranged substantially as specified.

137,018.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

The steam and hot water are conveyed from their respective boilers by means of pipes, or from perforated revolving cylinders, or into a perforated hopper, which receives the snow swept up by a suitable brush.

Claim.—A machine for melting snow and ice, consisting of suitably-mounted portable steam and hot water apparatus, in combination with the perforated distributing tank or chest E, through which hot water alone or hot water and steam together may be discharged upon the snow or ice, said tank being arranged be..eath the truck, substantially as specified.

137,019.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Claim.—A machine for melting snow or ice, consisting of a suitably mounted portable steam-generating and superheating apparatus, having tubes so arranged as to receive superheated steam from the superheater and discharge the same upon the snow or ice through pipes arranged between the wheels of the truck, substantially as specified.

137,020.—*Machine for Melting Snow.*—JOHN MULLALY, New York, N. Y.

Heated air and steam are discharged upon the snow or ice through the perforated distributing-disk.

Claim.—The combination, with a portable furnace, steam-generator, and hot-air chamber, of the perforated distributing tank or chest E, located between the wheels, and a blower or blowers, all substantially as and for the purpose specified.

137,021.—*Cattle-Guard for Railroads.*—GEORGE W. NEWTON, Hubbard, Ohio.

The transverse slats are journaled in a frame located between the rails, so as to partly turn when trodden upon by the animal, being prevented from complete rotation by the notches or stops *b b*. The unsteady footing causes the animal to withdraw.

Claim.—The combination of the frame A, slats *a a*¹, and the notched or recessed stops B, substantially as and for the purpose set forth.

137,022.—*Sawing Machine.*—ALBERT T. NICHOLS, Williamsport, Pa.

The parallel bars, which maintain the tension of the driving-belts, are pivoted to the saw-frame at their upper ends and connected at their lower ends to another set of bars journaled upon the driving-shaft, the two sets of bars maintaining the same tension of the belts when the position of the saw is changed.

Claim.—The combination with the sliding saw-carriage D and its guide *x* of the forked levers G' G', belt A, frame G, and shaft B, with one or more driving-pulleys, E, and belts *d*, all substantially as and for the purposes herein set forth.

137,023.—*Die for Making Carriage-Bolts.*—EBENEZER H. PLANT, Plantsville, Conn.

The device is fully explained by the claim and drawing, and the purpose of it is to transform, by lateral compression, the portion of a cylindrical bolt, commonly called the neck, to the shape of a triangle, and thus obtain three sharp angles connecting three flat faces that are severally of a breadth greater than the diameter of the remaining cylindrical portion of the bolt.

Claim.—The dies A C, one having a flat surface, and the other a triangular recess, D, substantially as and for the purpose specified.

137,024.—*Cultivator.*—WILLIAM H. PLATT, Dayton, Ohio.

A sleeve with a tongue in rear revolves on a round axle-tree or its equivalent. A pin passing through it and into one of a series of recesses cut at regular intervals from a portion of the circumference of the axle-tree, permits lateral adjustment and limited revolving movement. A corresponding part of the attachment has a socket for the front end of the plow-beam, and two ears in front to cover the tongue, a bolt attaching them. On the socket there is a clamp with corrugated surfaces for the arm of a clod-fender.

Claim.—1. In combination with an axle having recesses *c*, the sleeve H cast in a single piece, and having bolt *n*, substantially as specified.

2. The braces E and G, constructed and arranged as described, in combination with an axle having screw-thread D, substantially as described.

3. The socket M, cast in a single piece, adapted for holding a plow-beam, and for connection with a sleeve, H, and having serrations, as shown, to op rate in conjunction with the clamp P for holding a clod-fender, substantially as described.

137,025.—*Converting Cast-Iron into Wrought-Iron and Steel.*—ALONZO C. RAND, Aurora, Ill.

Claim.—1. Passing the molten iron from the cupola onto and through a perforated pan upon the top of a cylinder provided with an air-pipe and an eduction-pipe, substantially as and for the purposes herein set forth.

2. Passing a blast of air laterally into the molten iron while it is in fine streams, and falling into the cylinder under a perforated pan, substantially as and for the purposes herein set forth.

3. The combination of a cupola, one or more cylinders, C, with closed bottom and open top, a perforated pan. B, an air-pipe, E, and an eduction-pipe, D, all substantially as and for the purposes herein set forth.

137,026.—*Seeding-Machine.*—SILAS G. RANDALL, Providence, R. I., assignor to AMELIA A. RANDALL, same place.

A seed-box lies over two beams pivoted under the hounds of a wagon to admit of their being placed at an angle thereto and to one another. Attached to the under side of each beam is an axle longitudinal therewith, having on and revolving with it a series of disks, each bent to a segment of a sphere. A universal joint on one of the axles gives, by a rod, motion to gearing on the seed-box.

Claim.—1. The combination of the seed-box and the seed controlling apparatus with the axle-bars B and B', each of which is provided with the series of plate-wheels and is pivoted to the top plate, substantially as described, by means of which the m chine may be adjusted so as to cover the seed as it is dropped with much or little earth, as may be required.

2. In combination with a seeding-box and distributing device, operated by axles which are adjustable at various angles, the universal-joint coupling-link F, as and for the purposes specified.

137,027.—*Machine for Holding and Soldering Cans.*—WILLIAM REDHEFFER, JAMES REDHEFFER, JR., THOMAS G. REDHEFFER, Kansas City, Mo., and LUKE A. SMITS, Pawnee, Kan.; said SMITH assigns his right to said WILLIAM REDHEFFER, JAMES REDHEFFER, JR., and THOMAS G. REDHEFFER.

A wedge-shaped expander is operated by the handle. An adjustable hoop surrounds the can and arrests the action of the expander at a given point. A presser-lever, having an adjustable blade, is employed for pressing the edges of the can together at the seam.

Claim.—1. The combination of the spring N with the sliding plate I and the plates D E, substantially as specified.

2. The said spring connected to plate I by the pins which actuate the plates D and E, and said pins provided with a head above plate D, and made square in the part passing through plate I, substantially as specified.

3. The plates D E confined against overrunning each other endwise by flanges Q, substantially as specified.

4. The arrangement of the adjustable hoop T and the vise U W X, substantially as specified.

5. The combination, with the expander A, of a presser, A', substantially as specified.

6. The combination, with said presser, of an adjustable blade, C', substantially as specified.

137,028.—*Sewing-Machine.*—GEORGE REHFUSS, Philadelphia, Pa., assignor to AMERICAN BUTTON-HOLE OVERSEAMING AND SEWING-MACHINE COMPANY, same place.

The bent end of the lever, when in the position shown, prevents the shuttle from rising in its carrier. To remove the shuttle the elastic arm is disengaged from the carrier and the lever turned aside.

Claim.—The lever t, having a bent arm, adapted to the shuttle and an elastic arm arranged for being locked to and released from the carrier, all substantially as set forth.

137,029.—*Candlestick.*—AMOS E. ROGERS, La Grande, Oreg.

The top of the candlestick is weighted and so hinged that when the candle burns below it the top will drop over. A pin projects from the bottom, upon which the candle is held. A circular spring adapts the stick to hold different-sized candles. The metal of the drop part is cut away as much as possible to prevent heating of the candle.

Claim.—1. The socket A, the spur *d*, the spring *c* or its equivalent, in combination with the stand or base A and pipe or stem B, substantially as and for the purposes hereinbefore described and set forth.

2. The spur *d*, the socket A, and spring *c*, in combination with the automatic drop, the hinge-joint *b*, the weight E, the flange C, the stand A, and stem B, substantially as and for the purposes herein before described and set forth.

3. The automatic drop with the opening I therein, the socket A, and spur *d*, in combination with the stand A and pipe B, substantially as and for the purposes hereinbefore described and set forth.

137,030.—*Mattress.*—THEOPHILUS ROLLER, Allegheny City, Pa.

A series of spiral springs are suspended in a central rectangular frame. A filling of hair or other material upon each side of the springs completes the mattress, and makes either side precisely the same as to its elasticity.

Claim.—A reversible mattress, provided with a central frame, in which are suspended spiral springs, which are suspended between canvas secured to the frame, between which and the outer ticking is placed filling of hair or any suitable material, substantially as herein described, and for the purpose set forth.

137,031.—*Shutter-Bowing Device.*—TOBIAS ROYER, Lancaster, Pa., assignor of one-half his right to JOSEPH R. ROYER, same place.

A rigid arm, in form of an arc of a circle, is pivoted to a stud, which is removably secured by a slot and lug to a plate, to be secured upon one of the shutters. This arm is furnished with a stop projection at its outer end, and with a series of slots along its side for fastening the shutter at any point desired. These slots fit over a small lug on the bottom of a recess in a plate, to be secured upon the opposite shutter. A single slot only, which is near the pivoted end of the arm, allows the arm to enter and leave the opposite plate, so that the shutters cannot be entirely freed so as to be opened, except when brought almost together. The shutters can thus be bowed partially open and yet secure against burglars from the outside.

Claim.—The curved bar B, with its notches *b b b'* and arresting-lug *d*, when hinged to a swivel-head, F, with its key *f*, in combination with the plates A A', all jointly arranged and operating substantially in the manner and for the purpose specified.

137,032.—*Cap.*—BONIFACE SCHARL, Boston, Mass.

A stiff visor is secured within the brim, which it retains in various positions.

Claim.—As a new article of manufacture, the above-described multiform cap, composed of body A, top B, visor D, and band or shield E, when constructed substantially as set forth.

137,033.—*Machine for Making Double-Tapered Thread.*—GEORGE V. SHEFFIELD, Boston, Mass.

An ordinary drawing and twisting tube has pivoted to it, on opposite sides, and projecting into its bore, holding jaws, which are closed automatically and intermittingly upon the roving, passing through the tube, and hold it while it is drawn and twisted by the rollers in front of the tube so that between the rollers and the jaws it will be drawn fine, while at other points its full size is preserved.

Claim.—1. The combination, with the tubular frame E, of the clamping-jaws F' F', drawing-rolls *c c*, clamping-ring I', and the intermittingly-operating lever L, substantially as and for the purposes set forth.

2. The combination, with lever L, of the cam K, shaft J', gear J, and worm *f*, substantially as and for the purposes set forth.

137,034.—*Lamp Shade.*—WILLIAM SIMONS, Charleston, S. C.

The shade is made of two like parts, each of double-lanceolated form, joined at their ends in such manner that their lower edges form a complete circle, while between the upper edges is left an opening considerably longer than it is broad.

Claim.—As an improved article of manufacture, the shade formed of the two like parts A and B, each shaped as shown and described, and lapped and united at their ends by detachable fastenings *a a*, so as to form V-shaped notches at the top and a complete circle at the bottom, as shown and described, for the purpose specified.

137,035.—*Crushing-Mill.*—JAMES W. SMITH, Columbus, Ga.

Cylinder having alternate plane and toothed surfaces, combined with adjustable concave formed of sections having deep grooves between them. Plane surfaces and grooves relieve crushing-surfaces and prevent clogging. Concave attached to a door so as to be accessible for repairs.

Claim.—1. The crushing-cylinder D, provided with the plain spaces *g* and teeth h, as herein shown, in combination with two or more adjustable section concaves, G, having the recess *f* between them, as described, the whole constructed and arranged substantially as set forth.

2. The door F on the case A, in combination with a concave and with a crushing-cylinder, constructed and operating substantially in the manner and for the purpose herein set forth.

137,036.—*Earth-Auger.*—HIRAM C. STOUFFER, Canfield, Ohio.

The spiral threads penetrate the soil, which is cut smoothly by the knives and forced through the openings into the cavity of the shell, where it is retained by valves so as to be lifted and removed.

Claim.—1. In an earth-anger, the combination of a closed shell, A, with encircling spiral ribs or threads B and an interior closed receiving-chamber, D, for the earth, essentially as described.

2. The combination, in an auger having an interior closed chamber, D, and external spiral threads, of knives E, arranged at entrance-openings F of said interior chamber, essentially as and for the purpose described.

3. The combination, with an auger in which the spiral threads encircle an interior earth-receiving chamber having inlet-openings F, of flexible valves G, arranged to operate essentially as described.

137,037.—*Valve for Air-Brake Cylinder.*—NICHOLAS THOMAS, Chicago, Ill., assignor of one-half his right to THOMAS HULL, same place.

A valve, pivoted to the cylinder-head, has two faces, one above and one below, which have proper seats thereon. When the air is turned on the upper valve admits the air and closes the lower one. When the supply is cut off the back pressure closes the upper and opens the lower one, as the surface of the upper one is in excess of the lower one.

Claim.—The combination of an air-brake cylinder with the valve hung on a pivot with two valve-seats, one or both of the valves or valve-seats being made elastic, and so arranged that the opening of one will close the other, substantially as and for the purpose specified.

137,038.—*Fire-Proof Roof.*—EDWARD S. TOBEY, Boston, Mass.

Claim.—1. In combination with a building having its roof so constructed as to form a tank or reservoir, the supply-pipes *b* and *k*, the discharge-pipes *e*, and the slots or apertures *d*, and plugs 5, so as to increase the overflow of the water on the side of the building most exposed to the fire, all constructed and arranged substantially as and for the purpose set forth.

2. The pipe *k* leading from one of the supply-pipes to a point near or over the scuttle, substantially as and for the purpose described.

137,039.—*Bed-Bottom.*—BENJAMIN C. VAN DUZEN, Cincinnati, Ohio.

To the head-bar are attached lever springs, with a rod passed through the coils. Metallic stripe are running longitudinally and held by knobs on the outer sides of the head and foot bars, rest at the head upon the stirrup end of the springs.

Claim.—The described arrangement of frame A B C D, pins G H, elastic stripe I, duplex springs J, and rod K, arranged and operating as set forth.

137,040.—*Extension Step-Ladder.*—ANCIL W. WALKER and JAMES E. WALKER, Detroit, Mich.

An ordinary staple and hook form the means of attachment of the leg-extensions to the ladder. The extension-piece rests, by means of a stop, upon a latch. Adjustment is made by means of a button attached to the end of a rod passing through the ladder from side to side, which, when rotated, lifts the latch and allows the extension to be lowered.

Claim.—1. In combination with the rails A B the rod G, buttons H, latches or arms I, and stops J, substantially as described, and for the purposes set forth.

2. The combination of the side rails A B, legs C D, steps E, hooks and staples K, substantially as described, and for the purposes set forth.

137,041.—*Machine for Piling Textile Fabrics.*—ALBIN WARTH, Stapleton, N. Y.

The material, to be laid in a pile so that it may be cut out in patterns, is placed in the package-carrier, its end is passed about and between the bars of the tension device, and is then clamped at one end of the table, when the package-carrier is moved over the table and the fabric is laid and confined thereon at one edge by means of needles. A layer of fabric is added at each movement of the carrier. The table may be moved and the carrier left stationary.

Claim.—1. The combination of a tension mechanism, *d*, with the package-carrier C and piling-table A, substantially as and for the purpose described.

2. The combination of the gage *g* with the bars of the tension-reel *d* and with a package-carrier, C, and piling-table A, substantially as set forth.

3. The combination of gage-plates with a piling-table and a package-carrier, constructed and operating substantially as and for the purpose set forth.

4. A series of retaining devices, substantially as described, arranged on the edge of a piling-table, as and for the purpose set forth.

5. The combination of pressure-plugs with the needles *p*, the piling-table, and the package-carrier, constructed and operating substantially as set forth.

6. The needles and their protectors combined with the piling-table and package carrier, constructed and operating substantially as and for the purpose described.

137,042.—*Sawing-Machine.*—JOSEPH M. WESTMORELAND, Willis, Tex., assignor of one-half his right to A. J. THOMPSON, same place.

A cross-cutting saw is attached to the lower end of a vibrating lever, the fulcrum of which has a vertical adjustment.

Claim.—The vibrating beam *a*¹, arm *e*, vertically-sliding block D, flanged scantling A, and saw F, combined and arranged substantially as and for the purpose described.

137,043.—*Revolving Fire-Arm.*—DAVID WILLIAMSON, Greenville, N. J.

Cylinder-stop operated by a cam on the pawl, and is arranged so as to catch with projections on the rear end of the cylinder or its connections. Also, extractor for starting all of the cartridges in a many-chambered fire-arm, the claws or shoulders of which are arranged in different planes so as to start one at a time. Also, extractor-stem provided with a return-arm so as to be operated at the joint or pivot of the barrel and have space for the returning-spring in a small pistol. Also, special construction of the frame, hammer, and pawl, whereby said parts may be assembled without having a removable side or bottom plate and still have the top of the opening fully closed.

Claim.—1. The pawl *e* hinged to the hammer *d*, and provided with the cam *i* and used in connection with lock-bolt *g* provided with the cam *i'*, substantially as and for the purpose specified.

2. The pins *u*, whether on the retractor or cylinder, when combined with suitable mechanism, so that the pins serve the double purpose of ratchets for revolving the cylinder and stops for holding it in position.

3. The retractor constructed substantially as described, and adapted to be used in connection with a many-chambered fire-arm, so that it will successively start the shells, as and for the purpose described.

4. The retractor having head *e* for displacing the shells, stem *n*, rearward-extending arm *r*, and pawl *s*, constructed and arranged to operate and to economize space substantially as and for the purpose specified.

5. The pawl *s*, hinged to the hammer *d* and the lock-bolt *g*, all constructed so as to be admitted through the opening *b* in the solid frame *a*, and when in place close the opening *b*, substantially as and for the purpose herein specified.

137,644.—*Wheel-Plow.*—JOHN WORRELL, Belleville, Ind.

An arched axle having one rearwardly-projecting arm so that the wheel may follow in the furrow cut by the plow.

Claim.—1. The axle A having the arms B B' projecting vertically downward, one bent at a right angle and extending toward one side, and the other bent at an obtuse angle and extending downward and toward the rear, substantially as shown and described.

2. The combination of the lever K and notched bar L, jointed pole M, connecting-bar G, and plow-beam R, substantially as shown and described.

3. The combination with the jointed pole and lever, of the elbow-lever H, radial hinge-brace D D E, plow-beam, and connecting devices I and G, substantially as specified.

REISSUE PATENTS.

5,325.—*Street-Sprinkler.*—LOREY F. BANCROFT, Worcester, Mass., assignor, by mesne assignments, to EDWARD E. QUIMBY, trustee, New York city.—Patent No. 53,257, dated April 3, 1866; reissue No. 3,917, dated April 12, 1870.

The tank is made with a flat bottom, and in a circular form from one edge of the flat portion up and over to the other edge. It is provided with a suitable sprinkling apparatus, and is held to the carriage by adjustable clamping-bands.

Claim.—1. In combination with the tank provided with apparatus for discharging jets of water, the adjustable clamping-bands L L, and the carriage or truck upon which the tank is mounted, substantially as described.

2. A carriage or truck and suitable sprinkling apparatus, in combination with a tank having a flat bottom narrower than the extreme lateral diameter of the tank, substantially as described, and for the purpose set forth.

3. The turret G upon the tank, as arranged with relation to the valve and to the sprinkling apparatus, substantially as described, and for the purposes set forth.

5,326.—*Process and Apparatus for Using Liquid Fuel for Producing Heat and Light.*—THOMAS S. DICKERSON and RODNEY M. WHIPPLE, Chicago, Ill.—Patent No. 102,662, dated May 3, 1870.

Improvement on invention described in patent 95,665 by placing the superheater over the jets which burn the gas, and a steam-generator over the furnace. Steam or superheated steam is mixed with the gas to assist and modify the combustion.

Claim.—1. The improved apparatus herein described, composed of a steam-boiler, superheater, gas-generator, arranged and combined as described.

2. The steam-pipe F, to supply steam to the apparatus, for the purpose described.

3. The process herein described for burning petroleum and other vaporizable hydrocarbons, the same consisting in first vaporizing the gas-producing material by means of superheated steam and then mixing with the gas or vapor superheated steam, substantially as described.

5,327.—*Manufacture and Application of Gas from Petroleum, &c.*—THOMAS S. DICKERSON, Chicago, Ill., assigner to himself and RODNEY M. WHIPPLE, same place.—Patent No. 95,665, dated October 12, 1869.

An upright tubular generator to contain oil which is vaporized by means of superheated steam in the tubes, the apparatus for superheating the steam being placed in the furnace in which the gas is burned.

Claim.—1. The generator, composed of steam-space E E, tubes A A, oil-space *b b*, steam-pipe F, when used for the manufacture of gas from petroleum and any other oleaginous substance, substantially as shown, and for the purpose set forth.

2. The combination of the generator and the dome.

3. The use and application of petroleum or other oleaginous substance for generating steam and for heating and illuminating purposes, by the combination and the process herein described, substantially as shown, and for the purposes set forth.

4. The combination of a steam superheater, a connecting steam-pipe, and a tubular generator, so as to form a gas or vapor apparatus, substantially as described.

5. The tubular generator, composed of a series of tubes connected by the flanged heads at opposite ends, and the whole surrounded by a boiler-plate covering, or its equivalent, substantially as shown, and for the purposes set forth.

5,328.—*Lubricator.*—WILLIAM T. GARRATT, San Francisco, Cal. Patent No. 133,217, dated November 19, 1872.

Claim.—1. In combination with the oil-reservoir A of a lubricator, the elevated condensing-pipe or vessel F, the lower end of which is connected by an opening, B, with the lower part of the reservoir A, substantially as and for the purpose hereinbefore set forth.

2. The combination, in a lubricator, of the cock or valve I with the condensing-pipe F and oil-reservoir A, substantially as and for the purpose hereinbefore set forth.

5,329.—*Stock for Holding Cutters in Planing-Machines.*—IVERS GIBBS, Worcester, Mass.—Patent No. 20,999, dated July 27, 1858; extended seven years.

The head is made of metal and cast hollow, for the purpose of securing the necessary strength with the least possible amount of material.

Claim.—A planer-arm of the external form herein described, and having between its central hub and cutter-sockets longitudinal cavities, as and for the purpose herein set forth.

5,330.—*Clothes-Wringer.*—THOMAS POOL, Brunswick, Ohio, assignor to METROPOLITAN WASHING-MACHINE COMPANY.—Patent No. 35,705, dated June 24, 1862.

A clothes-wringer constructed with rolls in ordinary form, with journals extending through the sides of the frame, over which are sliding journal-boxes, held over them by screw-heads with slots to allow the adjustment of the roll. Over and under the journal-boxes are springs extending the entire length of the frame, secured at their center by screws and their ends resting upon the boxes, to allow the separation and closing of the rolls when in use.

Claim.—1. The combination of two pressure-rollers with a slotted supporting frame, in which the axes of both rollers are free to move toward and from each other, and with yielding bearings acted on by springs to allow the movement of both rollers, and thereby increase the elastic action, substantially as herein specified.

2. In connection with the above, giving an equal, or nearly equal, elastic action to each roller by means of the long springs M N, made exact counterparts of each other, and arranged substantially as and for the purposes herein set forth.

3. The combination and arrangement of the spring or springs M N, sliding bearing-blocks P P Q Q, having guide slots and bearings *d d g g*, and the stationary guide-screws or pins *f f* applied to the rollers, substantially as and for the purposes herein specified.

5,331.—*Cradle.*—LEWIS SPERRY, East Windsor Hill, and LESTER ROBINSON, New Haven, Conn., assignors to LEWIS SPERRY and ADELIA SPERRY.—Patent No. 92,896, dated July 20, 1869.

A cradle sustained on uprights by pinions, having clock-work under it attached to a frame with a pivot-plate, the pivot of which passes through a slot in another attached to the cradle, by which motion is communicated to it.

Claim.—In combination with a clock-work driving a crank, K, a slot, *b*, formed in or attached to the thing to be vibrated, the crank-pin *a* working in the said slot to cause the said slot to move transversely to the axis of vibration, substantially as described.

5,332.—*Basket.*—ROSCOE B. WHEELER, Dowagiac, Mich., assignor of one-half interest to HENRY LARDNER.—Patent No. 132,703, dated October 29, 1872.

An overlapping series of splints or staves are used as an inside lining to a stave basket, or a basket made with vertical splints.

Claim.—The overlapping series of staves C, when used as an inside lining to a stave basket, substantially as and for the purposes hereinbefore set forth.

INDEX OF INVENTIONS PATENTED MARCH 18, 1873.

[The numbers in parentheses denote the classification of patents.]

Alarm, burglar, (24,) W. H. McPherson 137,016
Ash sifter, (170,) C. S. Collins 136,902
Auger, earth, (51,) H. C. Stouffer 137,036
Bag turning machine, (95,) J. Martin 136,920
Balloon advertiser, (54,) E. L. B. Moodle 136,930
Basket, (63,) R. B. Wheeler, (reissue) 5,332
Bed bottom (62,) B. C. Vandusen 137,039
Bee hive, (9,) Newman and Brown 136,933
Bee hives, moth trap for, (9,) L Gates 136,911
Boilers, furnace for steam, (148,) J. Westerman 136,948
Boilers, using anthracite coal dust or slack as fuel in locomotive, (94,) A. Berney 136,960
Bolt, door, (24,) A. Pelham 136,861
Bolts and rivets, manufacture of, (14,) W. Livingstone 137,009
Boot and shoe shank, (16,) G. Goodyear 136,994
Boot and shoe sole stamp, (16,) A. M. Burnham 136,901
Bracket or shelf, hanging, (62,) A. C. Brown 136,900
Bridge, truss, (21,) J. Anderson 136,951
Bridges, construction of, (21,) S. B. B. Nowlan 136,935
Buckle, turn, (9,) T. Gaillard 136,910
Button, (33,) A. E. Thurber 136,882
Camera stand, (111,) B. Holler 136,997
Can, sealed, (58,) W. H. I. Howe 176,920
Can, air tight tin, (58,) J. W. Wright 136,949
Can for meats, &c., metallic, (58,) E. M. Wood 136,880
Cans, machine for holding and soldering, (136,) Redheffer and Smith 137,028
Canal boats, means of snubbing, (138,) T. W. Edgar 136,982
Candlestick, (90,) A. E. Rogers 137,029
Candlestick, (90,) Z. I. Pratt 136,864
Canteen, hospital, (162,) H. Beck 136,808
Cap, (76,) B. Schaal 137,032
Car coupling, (122,) W. E. Beman 136,958
Car coupling, (122,) Marston and Jones 137,014
Car coupling, (122,) Withington and Taylor 136,989
Car seat, reversible, (121,) P. F. Duchemin 136,922
Car for carrying petroleum, (121,) J. Clark 136,813
Carriage axle trees, gage for setting, (31,) L. D. Cross 136,819
Carriage bolts, die for making, (31,) E. H. Plant 137,023
Carriages, manufacture of rub irons for, (31,) H. W. Oliver, Jr 136,857
Cartridge holder, (32,) L. J. Gaines 136,967
Chains, box slide for ornamental, (86,) O. J. Valentine 136,946
Chair, (62,) Baughman and Chalk 136,956
Chair brace, (62,) G. F. Ellis 136,924
Chair and lounge for invalids, combined, (62,) D. G. Boardman 136,909
Churn power, (67,) W. A. Lewis 136,925
Cider, putting up and preserving, (19,) Halsted and Wheeler 136,914
Cloth, machine for folding and measuring, (37,) A. M. Cheney 136,967
Clothes drier, (91,) E. B. Gilderaleeve 136,831
Clothes wringer, (91,) T. Pool, (reissue) 5,330
Coal, &c., machine for breaking, (3,) R. A. Wilder 136,987
Coffee roaster, cover for, (154,) L. J. Dyke 136,980
Cradle, (62) Sperry and Robinson, (reissue) 5,331
Cultivator, (43,) W. H. Platt 137,024
Digger, potato and peanut, (114,) C. E. Peirce 136,860
Dish cover, (68,) A. J. Ohmer 136,856
Distilling apparatus, (47,) G. Hunziker 136,921
Door spring, (24,) W. M. Kellie 136,923
Door spring, (24,) S. Cutler 136,974
Drawers, (62,) F. Rose 136,989
Drill, brace, (100,) G. Gibbs 136,830
Drill rods, safety clamp for rock, (124,) M. C. Bullock 136,812
Drilling machine, rock, (124,) C. Lohnes 137,010
Earth closet, (8,) B. L. Mack 137,013
Elevator, (79,) C. Du Bois 136,978
Engine, rotary, (150,) W. P. Hayes 136,981
Engines, condensing apparatus for steam, (150,) J. Houpt 136,917
Engine, direct acting steam, (150,) J. Bailey 136,806
Engine jet condenser, steam, (150,) J. Houpt 136,918
Engine, dummy or traction, (94,) A. A. Wilder 136,886
Excavator, (51,) B. A. Oliver 136,936
Excavator, (51,) A. P. Lomax 137,011
Fabrics, machine for piling textile, (37,) A. Warth 137,041
Fare box, (42,) Z. L Pratt 136,865
Fats and deodorizing gases, apparatus for rendering, (26,) H. S. Firman 136,927
Feather, made, (38,) A. E. Woolf 136,891
Fence, iron, (52,) C. T. Bush 136,966
Fence, portable, (52,) J. E. Garlington 136,929
Fire escape, (79,) F. A. L. Von Ehren 136,863
Fire proof roof, (136,) E. S. Tobey 137,038
Fire arm, revolving, (123,) D. Williamson 137,043
Fire arm, breech loading, (18,) H. Hoppenan 136,998
Fire arm, breech loading, (18,) I. M. Milbank 136,850
Fire arm, breech loading, (18,) G. Zeller 136,894
Fire arms, cartridge ejector for revolving, (32,) Smith and Sweeney 136,871
Fire plug and cistern combined, (167,) Latta and Hughes 137,006
Fish spawn hatcher, (143,) M. G. Holton 136,834
Fishing rod, (143,) J. B. McHarg 137,015
Floor timber support, (30,) T. Voelckers 136,947
Fruit crate, (63,) W. H. Clarkson 136,968
Fuel for producing heat and light, using liquid, (27,) Dickerson and Whipple, (reissue) 5,326
Furnace, glass, (68,) Bayard and Mason 136,957
Gas from petroleum, manufacture and application of, (27,) T. S. Dickerson, (reissue) 5,327
Gate, automatic, (52,) W. L Wooster 136,892
Glass blind slats, mold for making, (68,) E. B. Hungerford 136,835
Gridiron, (154,) A. Batallie 136,955
Grindstone trough and support, (76,) C. P. Richardson 136,939
Hames, staple socket for, (72,) R. J. Algeo 136,893
Harness saddle, (72,) A. V. Sergeant 136,870
Harvester, (74,) R. A. Roberts 136,940
Harvester, cotton, (75,) J. W. Leigh 136,924
Harvester reel rake, (74,) C. A. Werden 136,895
Hat and coat hook, (24,) J. Danner 136,905
Heel trimming and burnishing machines, attachment for, (16,) S. H. Hodges 136,916
Hook and eye for tackle blocks, (79,) J. Holroyd 136,833
Horse power, (159,) G. M. Branch 136,899
Horse collar cap, (72,) R. J. Algeo 136,894
Horses, apparatus for shearing, (144,) W. Harrison 136,993
Ingot mold, adjustable, (33,) M. S. Drake 136,881
Iron into wrought iron and steel, converting cast, (66,) A. C. Rand 137,025
Jar, fruit, (53,) G. W. Hompell 136,996
Knife cleaner, (86,) H. C. Gilbert 136,980
Ladder, extension step, (62,) A. W. and J. E. Walker 137,040
Ladder, fire escape, (30,) H. Lyles 136,844
Lamp, (90,) L. Michaels 136,849
Lamp shade, (90,) W. Simons 137,034
Lamp chimneys, glass mold for forming, (66,) M. H. Collins 136,971
Lantern, (90,) E. K. Haynes 136,984
Lathe, machine for sawing, (174,) J. M. Stowell 136,944
Leaching and tanning apparatus, (92,) C. Kora 137,004
Lock, hasp, (93,) Stimens and Martin 136,877
Lock, permutation, (93,) E. W. Brettell 136,963
Loom stop mechanism, (95,) J. J. Switzer 136,880
Lounge, folding, (62,) A. Lundberg 136,843
Lubricating compound, (87,) E. Rost 136,886
Lubricating compound, (87,) E. A. Tomer 136,945

Lubricator, (87,) W. T. Garratt, (reissue) 5,328
Match composition, (71,) Babcock, Leonard and Crane 136,953
Match sticks, machine for making, (174,) F. Zaiss 136,893
Mattress, (62,) T. Roller 137,030
Medical compound, (35,) J. L. Putegnat 136,937
Medicine, case, (156,) W. H. Cutler 136,973
Mill, crushing, (3,) J. W. Smith 137,035
Mill, cider and wine, (19,) McCreight and Glasgow 136,947
Mill for grinding paint, (107,) Kingdon and Dodge 136,838
Millstone driver, (57,) J. Planck 136,863
Mop holder, (22,) C. L. Haines 136,912
Mower, lawn, (75,) Coldwell and Chadborn 136,989
Nut lock, (14,) B. W. Davis 136,906
Nut locks, washer for, (14,) M. F. McIntyre 136,848
Offal and manufacture of fertilisers, treating, (46,) J. J. Storer 136,943
Oil, treating linseed, (47,) D. D. Templeton 136,881
Oil wells, extracting tubular casings from, (124,) H. Harris 136,992
Ox shoes, machine for making, (60,) W. Hamilton 136,915
Package band and fastener, (146,) F. R. Hunt 137,000
Pail and commode, slop, (68,) G. Howland 136,999
Pans, machine for wiring sheet metal, (136,) W. Foglesong 136,986
Perambulator, (31,) A. W. Richards 136,867
Piano action, upright, (112,) R. Kreter 137,005
Pickets, machine for pointing, (174,) H. Balcom 136,807
Pill making machine, (156,) C. B. Littlefield 137,008
Pinchers and grappling tool, combined adjustable, (100,) S. B. Dexter 136,907
Pipe for gas, water, &c., (167,) E. H. Austin 136,932
Planing machines, stock for holding cutters in, (174,) I. Gibbs, (reissue) 5,329
Planter, corn, (75,) D. G. Boardman 136,961
Plow, wheel, (114,) J. Worrell 137,044
Pocket, safety, (38,) S. Engel 136,983
Pot or ladle, molder's, (33,) J. McCleary 136,927
Press, baling, (7,) H. K. Burnett 136,985
Press, cotton, (7,) R. Lewis 136,841
Press, cotton, (7,) B. G. Martin 136,846
Press, furnace block, A. Hall 136,913
Pruning shears, (63,) M. De Groodt 136,890
Pump, acid, (118,) F. Nichols 136,934
Pump, siphon, (118,) J. M. Bois 136,809
Punching machine, (119,) R. Baird 136,954
Railroads, cattle guard for, (120,) G. W. Newton 137,021
Railroad rail, (120,) G. C. Morgan 136,858
Railroad switch, (122,) D. J. Arnold 136,895
Railroad snow plow, (122,) W. Davis 136,975
Railroad track tamper, (120,) P. Magee 136,845
Rice huller, (57,) M. E. Stacy 136,948
Ring, suspension, (23,) G. Doolittle 136,977
Roll for rolling railway rails, (125,) J. W. Cooper 136,816
Roofing, composite, (126,) R. Lebndorff 136,840
Sad iron, (91,) S. S. Fitch 136,829
Sails, lizard for, (138,) C. H. Gallagher 136,988
Saw bench, circular, (130,) B. F. Dunklee 136,979
Sawing machine, (130,) A. T. Nichols 137,022
Sawing machine, (130,) J. M. Westmoreland 137,042
Screw cutting machine, (14,) Crane and Lavinia 136 818
Seeding machine, (133,) S. G. Randall 137,026
Separator, clover, (159,) C. L. Allen 136,805
Sewing machine, (134,) A. S. Dinsmore 136,976
Sewing machine, (134,) J. V. D. Eldredge 136,823
Sewing machine, (134,) Lincoln and Rayer 137,007
Sewing machine, (134,) G. Rehfuss 137,028
Sewing machine attachment, (134,) T. J. Peaslee 136,859
Sewing machine extension table, (134,) J. Benner 136,959
Sewing machine table, (134,) W. M. Cuthbert 136,903
Sewing machines, gathering attachment for, (134,) T. S. Huntington 137,002
Sewing machines, ruffling attachment for, (134,) T. S. Huntington 137,003
Sewing machines, device to prevent retrograde motion of balance wheel on, (134,) G. W. Cook 136,972
Shoemakers, shank laster for, (16,) J. H. Bean 136,896
Shovel, snow, (63,) E. Hunter 137,001
Shutter bowing device, (24,) T. Royer 137,031
Sidewalk, composition, (150,) C. H. Howard 136,919
Single-tree, (31,) Williams and McKennie 136,868
Sleigh brake, (31,) F. A. Kirch 136,839
Snow, machine for melting, (110,) J. Mullaly 136,853
Snow, machine for melting, (110,) J. Mullaly 136,854
Snow, machine for melting, (110,) J. Mullaly 136,931
Snow, machine for melting, (110,) J. Mullaly 136,932
Snow, machine for melting, (110,) J. Mullaly 137,018
Snow, machine for melting, (110,) J. Mullaly 137,019
Snow, machine for melting, (110,) J. Mullaly 137,020
Sprinkler, street, (167,) L. F. Bancroft, (reissue) 5,325
Stalk cutter and land roller, combined, (73,) J. Price 136,866
Stone, artificial, (153,) P. Daniels 136,904
Stone puller, (79,) G. Sprinkel 136,941
Stone, tile, &c., composition for artificial, (153,) A. Pelletier 136,908
Stove window, (154,) F. Warriner 136,894
Stove pipes, extension attachment for, (154,) S. Johnson 136,922
Strap, hitching, (72,) A. M. Brubaker 136,811
Table, (62,) W. Jefts 136,837
Table leaf support, (62,) W. Jefts 136,836
Telegraph, duplex, (50,) J. B. Stearns 136,873
Telegraph, duplex, (50,) J. B. Stearns 136,874
Telegraph key, duplex, (50,) J. B. Stearns 136,875
Telegraph relay and sounder, (50,) J. B. Stearns 136,876
Thread, machine for making double tapered, (142,) G. V. Sheffield 137,033
Tobacco cultivator, (43,) Z. D. Blakistone 136,898

Tobacco hiller, (43,) Z. D. Blakistone 136,897
Tobacco package, (160,) E. L. Felgner 136,964
Tobacco, treating, (160,) Stafford and Fowler 136,872
Trap, animal, (143,) A. M. Lovett 136,943
Trap, rat, (143,) T. Hebb 136,995
Treadle, (67,) J. B. Bollinger 136,810
Trowel, (4,) S. F. Streeter 136,878
Type, casting, (164,) A. C. Converse 136,815
Valve, balanced, (152,) H. Fitzsimmons 136,965
Valve, safety. (152,) G. J. Rains 136,938
Valve, cock, &c., stop, (167,) H. C. Montgomery 136,851
Valve for air brake cylinders, (122,) N. Thomas 137,037
Vehicle wheel, (31,) M. McNalley 136,928
Vehicle wheel, (31,) Miller and Wright 137,017
Vessels, raising sunken, (62,) R. W. Hallett 136,832
Vessels, buoying and stopping holes in, (137,) J. W. Cooper 136,817
Wagon seat, (31,) A. J. Cogan 136,814
Wash board, (91,) J. B. Fisher 136,828
Washing machine, (91,) C. Cole 136,970
Washing machine, (91,) P. C. Dillan 136,908
Washing machine, (91,) O. B. Evans 136,825
Washing machine, (91,) J. B. Fisher 136,909
Washing machine, (91,) W. E. Millegan 136,929
Washing machine, (91,) H. Myers 136,855
Water mains, apparatus for tapping, (167,) W. Young 136,950
Windmill, (118,) Long and McEvers 137,012
Window blind, (69,) L. Park 136,858
Window screen, (29,) L. W. Fifield 136,826
Wrench and bolt cutter, (100,) P. Broadbooks 136,964

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 18, 1873.

Algeo, R. J., Staple socket for horses 136,803
Algeo, R. J., Horse collar cap 136,804
Allen, C. L., Clover separator 136,805
American Button Hole, Overseaming and Sewing Machine Company, assignee 137,028
Armstrong, E., assignee 136,805
Anderson, J., Truss bridge 136,951
Arnold, D. J., Railroad switch 136,895
Austin, E. H., Pipe for gas, water, &c 136,952
Babcock, J. F., Leonard, W. A., and Crane, E. B., Match composition 136,953
Bailey, J., Direct acting steam engine 136,806
Baird, R., Punching machine 136,954
Balcom, H., Machine for pointing pickets 136,807
Bancroft, L. F., Street sprinkler 5,325
Bataille, A., Gridiron 136,955
Baughman, J., and B. R. Chalk, Chair 136,956
Bayard, E., and B. A. Mason, Glass furnace 136,957
Bean, J. H., Shank laster for shoemakers 136,896
Beck, H., Hospital canteen 136,808
Beman, W. E., Car coupling 136,958
Bennett, D., assignee 137,016
Benner, J., Extension table for sewing machines 136,959
Berney, A., Using anthracite coal dust or slack as fuel in locomotive boilers 136,960
Blakistone, Z. D., Tobacco hiller 136,897
Blakistone, Z. D., Tobacco cultivator 136,898
Boardman, D. G., Corn planter 136,961
Boardman, D. G., Combined chair and lounge for invalids 136,962
Bois, J. M., Siphon pump 136,899
Bolinger, J. B., Treadle 136,810
Boyer, J. E., assignee 136,963
Branch, G. M., Horse power 136,899
Breitenstein, H., assignee 136,806
Brettel, E. W., Permutation lock 136,963
Broadbooks, P., Wrench and bolt cutter 136,964
Brown, A. C., Hanging bracket or shelf 136,900
Brown and Newman 136,933
Brubaker, A. M., Hitching strap 136,811
Bullock, M. C., Safety clamp for rock drill rods 136,812
Burnett, H. K., Baling press 136,965
Burnham, A. M., Boot and shoe sole stamp 136,901
Bush, C. T., Iron fence 136,966
Chadborn and Coldwell 136,969
Chalk and Baughman 136,956
Cheney, A. M., Machine for folding and measuring cloth 136,967
Clark, A., assignee 136,877
Clark, J., Car for carrying petroleum 136,813
Clarkson, W. H., Fruit crate 136,968
Cleenewerck, B., assignee 136,803
Cogan, A. J., Wagon seat 136,814
Coldwell, T., and G. L. Chadborn, Lawn mower 136,969
Cole, C., Washing machine 136,970
Collins, C. S., Ash sifter 136,902
Collins, M. H., Glass mold for forming lamp chimneys 136,971
Compton, W., assignee 136,811
Converse, A. C., apparatus for casting type 136,815
Cook, G. W., Preventing retrograde motion of balance wheels on sewing machines 136,972
Cooper, J. W., Roll for rolling railway rails 136,816
Cooper, J. W., Buoying and stopping holes in vessels 136,817
Cox, A. M., assignee 136,936
Crane, Babcock and Leonard 136,953
Crane, C. S., and W. H. Lavinia, Screw cutting machine 136,818
Cross, L. D., Gage for setting carriage axle trees 136,819
Cuthbert, W. M., Sewing machine table 136,903
Cutler, S., Door spring 136,974
Cutler, W. H., Medicine case 136,973
Danner, J., Hat and coat hook 136,905
Daniels, P., Artificial stone 136,904
Davis, B. W., Nut lock 136,906
Davis, W., Railroad snow plow 136,975
Decker, D. and J., assignees 137,005
De Groodt, M., Pruning shears 136,820
Dexter, S. B., Combined adjustable pinchers and grappling tool 136,907
Dickerson, T. S., and R. M. Whipple, Using liquid fuel for producing heat and light, (reissue) 5,326
Dickerson, T. S., Manufacture and application of gas from petroleum, (reissue) 5,327
Dickinson, T. N., assignee 137,013
Dillan, P. C., Washing machine 136,908
Dinsmore, A. S., Sewing machine 136,976
Dodge and Kingdon 136,838
Doolittle, G., Suspension ring 136,977
Doolittle Manufacturing Company, assignee 136,977
Drake, M. S., Adjustable ingot mold 136,821
Du Bois, C., Elevator 136,978
Duchemin, P. F., Reversible car seat 136,821
Dunklee, B. F., Circular saw bench 136,979
Dyke, L. J., Cover for coffee roasters 136,960
Eayrs, W. P., Rotary engine 136,961
Edgar, T. W., Means of snubbing canal boats 136,962
Eldredge, J. V. D., Sewing machine 136,823
Ella, G. F., Chair brace 136,824
Engel, S., Safety pocket 136,963
Evans, O. B., Washing machine 136,825
Feigner, E. L., Tobacco package 136,964
Fifield, L. W., Window screen 136,826
Firman, H. S., Rendering fats and deodorizing gases 136,827
Fisher, J. B., Washboard 136,828
Fisher, J. B., Washing machine 136,909
Fitch, S. S., Sad iron 136,829
Fitzsimmons, H., Balanced valve 136,965
Fleehearty, J. T., assignee 136,902
Fogleseng, W., Machine for wiring sheet metal pans 136,966
Fowler and Stafford 136,872
Gaillard, T., Turn buckle 136,910
Gaines, L. J., Cartridge holder 136,967
Gallagher, C. H., Lizard for sails 136,968
Garlington, J. E., Portable fence 136,969
Garratt, W. T., Lubricator, (reissue) 5,328
Gates, L., Moth trap for bee hives 136,911
Gibbs, G., Brace drill 136,830
Gibbs, L., Stock for holding cutters in planing machines, (reissue) 5,329
Gilbert, H. C., Knife cleaner 136,990
Gildersleeve, E. B., Clothes drier 136,831
Glasgow and McCreight 136,847
Godfroy, W. A. T., assignee 137,016
Goodyear, G., Boot and shoe shank 136,991
Green, S., assignee 136,834
Greenwalt, A. B., assignee 136,811
Griscom, S. E., assignee 136,812
Hase, L., assignee 136,966
Haines, C. L., Mop holder 136,912
Haines, R., assignee 136,861
Hall, A., Furnace block press 136,913
Hall, G., assignee 136,892
Hallett, R. W., Raising sunken vessels 136,832
Halsted, Conse & Co., assignees 136,914
Halsted, M., and J. L., Wheeler, Putting up and preserving cider 136,914
Hamilton, W., Machine for making ox shoes 136,915
Harris, H., Extracting tubular casings from oil wells 136,992
Harrison, W., Apparatus for shearing horses 136,993
Haynes, E. K., Lantern 136,994
Hebb, T., Rat trap 136,995
Hempell, G. W., Fruit jar 136,996
Hodges Edge Trimming and Setting Machine Association, assignee 136,916
Hodges, S. H., Attachment for heel trimming and burnishing machines 136,916
Holler, B., Camera stand 136,997
Holroyd, J., Hook and eye for tackle blocks 136,833
Holton, M. G., Fish spawn hatcher 136,834
Hood, J. L. and H. C., assignees 136,805
Hoppenau, H., Breech loading fire arm 136,998
Houpt, J., Condensing apparatus for steam engines 136,917
Houpt, J., Jet condenser for steam engines 136,918
Howard, C. H., Composition side walk 136,919
Howe, W. H. L, Sealed can 136,920
Howe, W. H. L, assignee 136,949
Howland, G., Combined slop pail and commode 136,999
Hughes and Latta 137,006
Hull, T., assignee 137 017
Hungerford, E. B., Mold for making glass blind slats 136,835
Hunt, F. R., Package band and fastener 137,000
Hunter, E., Snow shovel 137,001
Huntington, T. S., Gathering attachment for sewing machines 137,002
Huntington, T. S., Ruffling attachment for sewing machines 137,003
Hunziker, G., Distilling apparatus 136,921
James, W., Jr., assignee 137,027
Jefts, W., Table leaf support 136,836
Jefts, W., Table 136,837
Johnson, S., Extension attachment for stove pipes 136,922
Jones and Marston 137,014

Kellie, W. M., Door spring 136,923
Kent, E. F., assignee 136,862
Kingdon, T. R., and L. P. Dodge, Mill for grinding paint 136,836
Kirch, F. A., Sleigh brake 136,839
Korn, C., Leaching and tanning apparatus 137,004
Kreid, U., assignee 136,806
Kreter, R., Upright piano action 137,005
La Moree, J. L., assignee 136,915
Lardner, H., assignee, (reissue) 5,332
Latta, F., and W. H. Hughes, Combined fire plug and cistern 137,006
Lavinia and Crane 136,818
Lehndorff, R., Composite roofing 136,840
Leigh, J. W., Cotton harvester 136,924
Leonard, Crane, and Babcock 136,953
Lewis, R., Cotton press 136,841
Lewis, W. A., Churn power 136,925
Lincoln, W. S., and W. A. Rayer, Sewing machine 137,007
Littlefield, C. B., Pill making machine 137,008
Livingstone, W., Manufacture of bolts and rivets 137,009
Lohnes, C., Rock drilling machine 137,010
Lomax, A. P., Excavator 137,011
Long, C. P., and C. N. McEvers, Windmill 137,012
Lovett, A. M., Animal trap 136,842
Lozier, S., assignee 136,964
Lundberg, A., Folding lounge 136,843
Lyles, H., Fire escape ladder 136,844
Mack, B. L., Earth closet 137,013
Magee, P., Railroad track tamper 136,845
Marston, F. W., and O. Jones, Car coupling 137,014
Martin and Stimens 136,877
Martin, B. G., Cotton press 136,846
Martin, J., Machine for turning bags 136,926
Mason and Bayard 136,957
McCleary, J., Molder's pot or ladle 136,927
McConnell, H., assignee 136,974
McCreight, A., and R. W. Glasgow, Cider and wine mill 136,847
McEvers and Long 137,012
McHarg, J. B., Fishing rod 137,015

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ampleas the conduct of the business in this office will readily permit. An order should therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

BOUND VOLUMES OF PATENTS.

The following statement is furnished by way of answer to the frequent inquiries made at the Patent Office as to the conditions under which the bound volumes of the drawings and printed specifications of patents are being furnished to public libraries:

I. The joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. A part of these copies are to be bound in volumes and placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

II. One hundred and fifty sets of the specifications and drawings of patents issued since July 1, 1871, have been bound into volumes for distribution under the provisions of this resolution. During the first year of the issuance of these volumes the patents of each week were bound into one volume. Fifty-two volumes per year (an issue takes place every Tuesday) was found to fill up the shelves of the libraries so fast as to make the custody of the volumes somewhat irksome and expensive. The Commissioner has, therefore, condensed the issues of each month into a single volume without making any deduction in the matter, the specifications and drawings being in full, but printed on both sides of the page, the drawings, four on a page. This change was made July 1, 1872. The contents are certified under the seal of the Patent Office; and each volume contains both a subject-matter index and an index of patentees. The usual annual index will also be prepared at the end of the year.

The volumes are bound in the best style, in law calf or in half-sheep, the former style costing $3.50 each, and the latter, $2.50. They can be sent through the mail, if so ordered, free of charge for transportation. Payments should be made in advance, and should cover a period of not less than three months.

III. Any library desiring to obtain a set of these volumes will be required to furnish evidence, satisfactory to the Commissioner of Patents, of its responsibility for the proper custody of the work, and of the facilities which it offers the public for consulting it. Special mention should be made of the number of hours in each day that the public will have access to the volumes, and particularly whether the library will be open for this purpose during the evening, which is considered a desirable arrangement whenever it can be adopted.

Evidence must also be furnished as to whether there are other public libraries in the same town or vicinity, and, if so, as to the character of such libraries, and as to the relative accommodation which the public would receive from the selection of the particular library making the application.

IV. Libraries will be permitted to receive the work only on the condition that it shall be carefully preserved; that the volumes shall not be loaned to individuals to be removed from the library rooms; and that the general public, whether subscribers to the remaining privileges of the library or not, shall, without charge, have unrestricted access to them during the established hours.

If it is found desirable to establish special rules for the use of the work, these rules should in all instances be reported to the Commissioner of Patents; and it is further understood that, if at any time the library is broken up, or declines longer to accede to the foregoing conditions, the volumes shall be held subject to the order of the Commissioner.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks).....	6,500
SEWING-MACHINES and attachments.....	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.....	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs.....	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the (linear) size of those attached to the patents and bound up for record: the illustrations are four on a page, but *facsimiles* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capitol of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisitions as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per copy per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COMMISSIONER'S DECISIONS.

A. C. GALLAHUE.—*Extension.*

[*In the matter of the application of Alpheus C. Gallahue for extension of patent for* PEGGING-MACHINE, *granted March 29, 1859, and reissued June 22, 1869, No. 3,517.—Decided March 29, 1873.*]

The employment of a known mechanism upon a machine to which it has never been applied before does not possess sufficient merit to entitle a patent for it to an extension, if it did not operate successfully and never went into use, although others afterward made the mechanism successful by adding devices which gave it a movement radically different.

In all successful shoe-pegging machines the point where the awl meets the last is made the center of an arc in which vibrates the pivot that the shoe swings on; and a machine in which that pivot is the center of an arc in which the last swings must be inoperative, and a patent for it is entitled to no favor upon an application for an extension.

LEGGETT, *Commissioner:*

This application is ably contested, the evidence is voluminous, the points for consideration are numerous, and the time left in which to dispose of the case before the expiration of the patent has been short, even though I had been pressed to the performance within this time of no other official duties of equal importance and difficulty. It is proper for me to say this much in explanation of the necessary omission here of a number of matters which counsel have properly deemed important to a full presentation and discussion of the case. I have given the fullest consideration possible, under the cir-

cumstances, to the facts and expert opinions presented pro and con, and I believe nothing of controlling importance has escaped my attention.

The reissued patent in question contains seven claims, but the contest mainly refers to the subject-matter of the second claim, which is as follows:

"Pivoting the plate or frame G that supports the last, at or near its center, and so arranging it that it may turn on said pivot during the operation of pegging, thereby so adjusting the boot or shoe as to present the various portions of the sole in the requisite position to the awl and peg as the sole moves along, substantially as described."

This claim, as I understand it, covers only the pivoting of the plate which supports the last, to give it a longitudinal oscillation—that is, a tipping up and down of the toe and heel alternately. The lateral swing, which is accomplished by the pivoting of the bed-plate near the base or platform of the machine, is not referred to.

The "pivoting" of the plate G "at or near its center," so "that it may turn on *said* pivot," is the entire substance of the claim. The rest is merely explanatory. It sets forth the result of that pivoting, and turning on that pivot as "thereby so adjusting the boot or shoe as to present the various portions of the sole in the requisite position." It is manifest to my mind, as testified by remonstrant's expert, and clearly illustrated by counsel, that the result specified, or any other very valuable result, cannot follow merely from this pivoting. A peculiar lateral movement is necessary in connection with a longitudinal pivotal adjustment. It is certain that no marketable machine could be produced upon the plan for providing a lateral movement shown by Gallahue. His lower pivot, near the base-plate, is his center of motion laterally, (and is not embraced in his claim,) as his upper pivot, immediately under his last, is his center of motion longitudinally with the last.

In a successful working machine the point of contact of the sole with the pegging devices must necessarily be the center of motion, in order that the pegs may have at once the proper direction and the proper uniform spacing. It is obvious to me, and I think it is proved, that neither of these results can be successfully accomplished by applicant's tipping jack upon irregular curved bottom shoes, to provide for the "undulations" of which his attempts were directed. The surface of the sole at the point of contact with the pegger must be kept in a horizontal plane, not by tipping from a pivot below, but by some other means that will not cause it to move in the arc of a circle, but which will make it the pivotal point or center of motion. This can only be done by having both the longitudinal and lateral pivots on the same horizontal plane, as in gimbals, or by having the pivots themselves movable under the point of contact with the pegger, as in the pegging-machines now in use. Such an arrangement is exactly the opposite of that of applicant. It is true that no successful pegging-machine is or probably can be made without a pivot for tipping and adjusting the last longitudinally to the pegger. Such a pivot, in connection with other pivots for making the point of contact with the pegger the center of motion in all directions, is proved to be used in all existing successful machines. The case, then, is this: Gallahue applied such a pivot in a certain way, with the purpose in view, as expressed in his claim, of "so adjusting the boot or shoe as to present the various portions of the sole in the requisite position to the awl and peg." He was the first to conceive and embody this idea, so far as he may be said to have embodied it. He procured a patent and had machines made, but none of them did, or in the nature of things could, prove successful in the shoe manufacture, because of his practical failure to adapt his pivot to the purpose he had in view. He did not apply it so that it would accomplish what he claimed for it. Such a pivot, however, has been found to be essential in pegging-machines, but others have rendered it useful by properly applying it and adapting it to the end in view through their own inventions and improvements.

Its value and importance were not practically demonstrated by Gallahue, because he did not proceed in the right direction and upon the proper plan. Gallahue made the pivot a *fixed center* upon which the last tilts longitudinally. The practical machine required that the fixed point should be at the point of contact of the awl with the sole, and that the pivot should oscillate. In Gallahue's the pivot is the center of an arc, through which the last swings. In the only machines which have proved successful the point where the awl meets the sole is made the center of an arc, through which the pivot vibrates. The difference is substantial and radical. It is the difference between success and failure. The pivot itself was not his invention. That was common property. It was only its proper application to the last-holder that constituted the invention and was valuable to the public. The conception of the idea of applying it was due to him, but he made such an application of it in his machines that it was of no practical importance. It was a failure so far as his work shows. The merit of applying it so as to make it a success involved invention which he did not exhibit, and is due to others.

Seeing it applied by others in a way to be valuable, and finding that he had not claimed it, he obtained a reissue of his patent with a specific claim seeking to cover it, but failed to do so for the reason that it was not shown in the records of his case.

It does not appear in proof that a single machine or a single tipping jack that he has made or caused to be made according to this patent has gone beyond the purposes of mere experiment into practical use in the shoe manufacture.

The testimony in the case is almost exclusively confined to the second claim, the other six claims being substantially ignored in the testimony and arguments.

With the evidence before me I do not perceive that what Gallahue has actually done for the public is of sufficient value and importance to warrant the grant of the extension sought, and it is accordingly refused.

C. CHAMBERS.—*Extension.*

[*In the matter of the application of Cyrus Chambers, Jr., for Extension of Patent No. 23,445, granted April 5, 1859, for* IMPROVEMENT IN PAPER-FOLDING MACHINES.—*Decided April 1, 1873.*]

Stops for receiving the paper after having been once folded in a paper-folding machine preparatory to a second operation, and which require a lateral adjustment in order to receive signatures of varying sizes, constitute no objection to the novelty of a curved or angular stop which will receive such signatures of any size without being specially adapted to them.

A device which has been superseded in practice by a better one of a different construction must be disclaimed, as well as one which is shown to be old, before a patent which specifies them as the patentee's invention will be extended.

Embracing in an argument reflections upon the Examiner, and insinuations against his motives, emphatically condemned.

LEGGETT, *Commissioner:*

The Examiner has submitted a very full, clear, and satisfactory report in this case, which leaves but little more for me to do than to verify its correctness. He correctly describes the operation of the machine, as follows:

"In this machine the sheet is impaled through the press-register holes, upon spring-seated register-pins on either side of the folding-line, which turn in brackets, one pin being adjustable to and from the other, and laterally, and the frame carrying the two being adjustable both laterally and longitudinally.

"As the folding-blade strikes the paper to double it into the bite of the folding-rollers the pins yield to release the sheet, which is carried onto the next set of folding devices by endless tapes, (under guide-rods, the ends of which project into recesses in one roller,) until the folded edge abuts against an adjustable concave-faced gage, when the second fold is accomplished as was the first. Successive folds are thus formed, and the completely-folded signature is ejected from the last folding-rollers and guided by two rods, twisted so as to turn it into correct position to be deposited in a V-shaped trough, where a reciprocating plunger (having adjustable plates to suit varying-sized signatures) carries it past a spring-seated lever, 10, (which strikes an alarm,) bearing against the back fold, and an adjustable arm or plate, 9, bearing against the free upper corners, which retain it, together with the accumulated mass, against a head retiring under pressure of such movement. The head has spring-jaws, which bear on wedge-shaped strips, decreasing toward the trough end, whereby their friction decreases as the head moves and the mass and weight of paper increase."

I concur in his opinion that the second claim, covering the means of adjusting one of the register-pins independently of the other, was improperly granted. Substantially the same means of adjusting one of the register-pins of a folding-machine are shown in the patent granted to applicant October 7, 1856. I find nothing to impeach the novelty of any of the remaining claims. The Examiner cites the patents of Smith, May 19, 1857, and North, August 10, 1858, against the fifth claim, which is as follows:

"The adjustable stop Z, with its inner edge of a curved or angular form, or otherwise, so constructed that the end of the folded edge only of the sheet shall be in contact with the said stop, for the purpose specified."

These patents show two adjustable stops on opposite sides of the machine formed of vertically-projecting strips of metal. It is true these will come in contact only with the ends of the signatures; but they are not adapted without special lateral adjustment to receive signatures of varying sizes. They are, therefore, not the equivalent of applicant's concave or angular stop, which will receive signatures of all sizes equally well without alteration of its position.

The curved wire for turning the folded signatures and delivering them into the trough in proper position for compression by the packing-plunger, embraced in the seventh claim, is admitted to have been supplanted in use by a superior device of a different character for this purpose. Therefore it appears not to possess the requisite value and importance as an invention to warrant the embodiment of a claim for it in a patent to be extended.

The utility of the devices embraced in the remaining claims has not been more successfully attacked by the remonstrants than their novelty.

The inventions embraced in them precisely meet the requirements of a simple and perfect automatic paper-folder of this class, and excite admiration. Their excellence for the purposes intended is manifest, and the ample testimony upon this point was not needed to convince me, having an operating machine before me. Applicant's statement and account are unusually full and particular, and bear the indications of candor and good faith. His diligence has been exemplary and his machines of his own manufacture have gone into extensive use. They rank among genuine labor-saving inventions of a high order; and under the law, upon proofs before me, it is clear that applicant, through no fault of his own, has not received a reasonable remuneration for the benefit he has conferred upon the public.

The extension will therefore be granted upon the filing of a proper disclaimer of the second and seventh claims, and the payment of the proper fee in accordance with the rules.

I regret that my duty in this case does not stop here. The attorney for the remonstrant has availed himself of the privilege of filing a printed argument in the case, to embody in it abusive language toward the Examiner, and to insinuate that he has been influenced by improper motives in making his report. If attorneys or others think they have reason for the use of such language, they should file direct charges, so that the Examiners may have opportunity to be heard. To interpolate such charges in an argument before the Commissioner is unprofessional and cowardly, and cannot be too strongly condemned.

N. H. GALUSHA.—*Reissue.*

[*In the matter of the application of N. H. Galusha for reissue of letters patent No. 89,304.—Decided March 31, 1873.*]

ABANDONMENT—RENEWAL UNDER THE ACT OF 1870.

Applications for a reissue do not come within the purview of section 32 of the act of 1870.

Neglecting to take any steps in prosecuting an application for a reissue for two years after the last action of the Office upon it does not work an abandonment of it.

LEGGETT, *Commissioner:*

The applicant in this case has permitted two years to intervene between the time of the previous action of the Office and one now sought to be made, and the question raised by the Examiner is as to whether section 32 of the law of July 8, 1870, applies so as to work an abandonment of the application.

The Examiner, without expressing an opinion in the matter, sends the case to the Commissioner for advice. Reading section 32, in connection with 30 and 31, I am inclined to the opinion that it was not the design of Congress to include in the operation of section 32 applications for reissue, especially as section 32 does not name reissues in terms. If the Office should hold the

contrary the only effect would be, not the abandonment of the invention as contemplated in said section, but simply the requirement of another fee, as the applicant could immediately make another application for a reissue.

For this reason it is very evident that reissues were not intended to be covered by this section. The case, therefore, will be proceeded without reference to the lapse of time since the previous action of the Office.

HENRY M. STOW.

[*Appeal from the decision of the Principal Examiner in the matter of the application of Henry M. Stow for patent for* WOOD PAVEMENT.—*Decided February* 21, 1873.

PRACTICE IN APPLICATIONS—SINGLE AND DUAL INVENTIONS.

Different structures, having no connection or co-operation with each other, and formed by different processes, cannot be allowed in the same application, although they belong to the same class and are of the same kind.

A wooden pavement in which the rows of blocks are kept separate by cords, and one in which the spaces are formed by cords, and after they are removed are filled in with sand, &c., and one formed of thin blocks with spaces between the blocks in each row, and not between the rows, cannot be considered in the same application, nor the processes by which the first two are made.

Each kind of pavement may be embraced with the process for making it in the same application.

THACHER, *Acting Commissioner:*

The subjects relating to the construction of wood pavement presented for patent in this application, as stated by the appellant and agreed to by the Examiner, are—

"1. Separating the rows of blocks by cord which is not to be removed, (or a strip of paper.)

"2. Separating them by a removable cord.

"3. Setting the blocks so as to obviate the necessity of interposing anything."

With reference to the first subject, applicant proposes to lay a row of rectangular blocks across the street, then to stretch a cord or a strip of thick tarred paper along the row against the blocks, and to set the next row against the cord or paper. The cord is left in place, and he finishes the pavement by filling the narrow spaces between the blocks with melted coal-tar, pitch, or some suitable cement. He claims the pavement as a new product formed of these elements in this way, and also the method of constructing it.

Second, applicant proposes to provide a number of ropes with a suitable covering to make them smooth, and to proceed as above described to lay the rows of rectangular blocks. When a number of rows have been laid the first rope is to be withdrawn, brought forward, and stretched against the row last laid. After another row is laid the next rope is to be withdrawn, brought forward, and used again, and so on with the others, the ropes forming no part of the completed pavement, but being employed merely to space the rows of blocks. After the ropes have been withdrawn the spaces are to be filled with sand, gravel, or cement. He claims this pavement and also this method of constructing it.

Third, applicant proposes to avail himself of the advantages of employing thin rectangular blocks in constructing a pavement (as narrow boards are employed for flooring) to avoid the effects of expansion and contraction. He takes rectangular blocks, of not less than one inch in thickness, and places them in rows across the street in close contact, but leaves spaces between the ends of the blocks, which he fills with sand, pitch, asphalt, or cement. He lays his blocks in the ordinary way, so that there is nothing novel in his method of proceeding, and in this case he claims the pavement only.

Thus it appears that applicant presents three distinct plans of construction, and he produces three distinct varieties of wood pavement. Two of the methods of construction he regards as new, and he claims them respectively. He regards all three of his pavements as new, and accordingly claims them all. The five claims are presented in a single application, and the Examiner requires that they be presented in separate applications, so far as they relate to complete independent and distinct devices. In other words, he holds that although the inventions are comprehended in the general subject—wood pavement—they are distinct wood pavements, complete in themselves, and have no relation to each other in construction or use, other than that of individual things of the same general class.

On the other hand, the applicant says: "I emphatically deny that this application relates to any more than one subject-matter, viz: the subject of *wood pavements*. That it may embrace three *inventions* I am not disposed to deny. This is true of every patent containing three valid claims, for no claim can be valid unless based upon a patentable invention, capable of sustaining a patent independently of the other claims in the same patent. * * If no more than one invention could be embraced in the same patent, then no patent could legitimately have more than one claim."

It is undoubtedly true, and the Examiner agrees, that the various inventions here claimed relate to one general subject, viz., wood pavement. It is also true that each valid claim in a patent must be based upon a *distinct* invention. Nevertheless, it does not follow that the inventions here claimed can properly be embraced in the same patent, because it is not all inventions belonging to the same general class that may be embraced in a single patent, but only such as are *related* to each other in construction and operation, such as have some *connection* or *dependence* when applied to use, either directly as co-operating and aiding each other, or indirectly as constituting independent parts of the same individual article, machine, or device. This is plainly the rule to be derived from the very cases applicant has cited. In *Hogg* vs. *Emerson*, 6 Howard, 437, in which the subject-matter under consideration by the Supreme Court of the United States was "certain improvements in the steam-engine, and in the mode of propelling therewith, either vessels on the water or carriages on the land," it was held as follows:

"To obtain more revenue the public officers have generally declined to issue letters for more than one patent described in them. Renouard, 293; Phillips on Patents, 218. The courts have been disposed to acquiesce in the practice, as conducive to clearness and certainty; and, if letters issue otherwise inadvertently, to hold them, as a general rule, null. But it is a well-established exception that patents may be united, if two or more included in one set of letters relate to a like subject, or are in their nature or operation connected together. Phil. on Pat. 218, 219; *Barrett* vs. *Hall*, 1 Mason, C. C., 447; *Moody* vs. *Fiske*, 2 Mason, C. C., 112; *Wyeth et al.* vs. *Stone et al.*, 1st Story, 273. *Those here are of that character*, being all connected with the use of the improvements in the steam-engine as applied to propel carriages or vessels, *and may therefore be united in one instrument.*"

The words above italicized are decisive of the meaning of the preceding declaration that "patents" may be united if they "relate to a like subject or are in their nature and operation connected together." All the cases of which I am cognizant are of the same tenor.

I concur in the opinion of the Examiner, that the three pavements here presented are *separate* and *distinct* devices, having no connection whatever with one another, such as to warrant their union in the same patent. Each is a *complete article*, and as *independent of the others* as it is possible for two devices of the same general class to be. They must therefore be presented in separate applications before patents can be granted for them. There is of course no objection to presenting a claim for one of these pavements and for the method of laying it in the same application, for such inventions "relate to the same subject" in the sense indicated by the decisions of the courts, and by the decision of the Commissioner in Linus Yale, *ex parte*, C. D., 1869, p. 110, relied on by the Examiner.

The decision of the Examiner is sustained.

L. W. FAIRCHILD.—*Design.*

[*Appeal from the Principal Examiner in the matter of the application of L. W. Fairchild for letters patent for a* DESIGN FOR A SIGN.—*Decided March* 12, 1873.]

SUBJECT FOR DESIGN PATENT—SPECIFICATION.

A name-sign with an imitation gold pen attached to it constitutes a proper subject for a design patent.

The case of Parkinson, *ex parte*, Commissioner's Decisions 1871, p. 251, distinguished from this and approved

All description of the mechanical construction of the article represented in a design for which a patent is asked should be eliminated from the specification, as well as all reference to the utility of its purpose.

THACHER, *Acting Commissioner:*

Applicant attaches an imitation gold pen to a name-sign, and asks a patent for the whole as a new design. The Examiner holds that this is not proper subject-matter for a design patent, and from this decision an appeal is taken.

The decision of the Commissioner in Parkinson, *ex parte*, 1871, is cited as authority for the opinion of the Examiner. In that case the article was a tool for mechanical purposes, and the peculiar form, for which a design patent was asked, was intended solely for purposes of utility. In the present case the completed article has no mechanical function whatever, and the design represented is a matter of taste. It is not, therefore, in my opinion, open to the criticisms so justly made in the Parkinson case.

As the subject-matter of this application is a matter of taste, and, to some extent, ornament, designed to attract the eye, I think there can be no doubt of the propriety of granting a patent for the design as requested.

The decision of the Examiner to this extent is overruled; but, of course, without pronouncing upon the question of novelty, which is not brought up by this appeal.

The specification, however, requires careful revision. All description of the mechanical construction of the article should be eliminated, as well as all reference to its purpose as a matter of utility. All matter of this description is improper in a design patent. The Examiner will, therefore, require suitable amendments in the case before further action.

L. F. MUNGER—*Extension.*

[*In the matter of the application of Lyman F. Munger for the extension of letters patent No.* 23,040, *for* IMPROVEMENT IN LOCKS, *granted February* 22, 1859, *and reissued December* 1st, 1871.—*Decided February* 21, 1873.]

INTEREST IN EXTENDED TERM.

A patentee who has allowed his employers to work his invention without compensation, and has agreed that they may continue to do so during the extended term, which will therefore inure mainly for their benefit, if not entirely, should not have his patent extended, although he has not received an adequate remuneration.

THACHER, *Acting Commissioner:*

This appears to be a meritorious case in nearly all respects. I find, however, two insuperable obstacles to the grant of the extension sought. It appears that after a series of unsuccessful attempts to introduce his invention into public use and make it remunerative to himself, the inventor, about 1870, entered the employment of Sargent & Greenleaf, manufacturers of locks at Rochester, New York. They commenced the manufacture of his patented locks, and have continued said manufacture ever since, putting upon the market a large number, said to be at least six thousand, and they are now making large quantities. The inventor states that this use of his patent was with his consent and allowance, and that he never charged them anything for it, but gave his employers the free use of the invention. At the same time he estimates that thirty cents on a lock would be a fair royalty for the use of his invention. If this had been paid him by the manufacturers it would have yielded a handsome remuneration. It seems, therefore, that he has failed to secure remuneration for the use of his invention by fault of his own.

It furthermore appears that an agreement has been entered into with Sargent & Greenleaf, by which they are to continue the manufacture of the locks under the extension, if granted, upon the same terms as in the past.

I do not see, therefore, how the inventor is to obtain remuneration in the future. Sargent & Greenleaf have already the market for the article, and, as they will manufacture without the payment of royalty, they will be able to hold the market against other manufacturers who may enter into arrangements to make and sell Munger's locks upon the payment to him of a suitable royalty.

Under these circumstances the conclusion is inevitable that the extension of the patent would be almost solely for the benefit of Sargent & Greenleaf instead of the inventor.

The prayer of the petitioner, therefore, must be denied.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,526.—*Manufacturing Webbing.*—Granted to JAMES C. COOKE, January 4, 1859. Application filed under act of Congress approved January 10, 1873. Hearing April 9, 1873.

23,750.—*Animal-Traps.*—Granted to AMOS S. BLAKE, April 26, 1859. Hearing April 9, 1873.

23,771.—*Ladies' Collars and Cuffs.*—Granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued in four divisions, No. 1,960, 1,961, 1,962, and 1,963, June 6, 1865; No. 1,960 having been ordered to again reissue, No. 5,259, January 28, 1873. Hearing April 9, 1873.

23,792.—*Gas-Pipe Cutters.*—Granted to JOSEPH E. STANWOOD, April 26, 1859. Hearing April 9, 1873.

22,793.—*Cracker-Machines.*—Granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869. Application filed under special act of Congress approved January 10, 1873. Hearing April 2, 1873.

23,795.—*Pump-Boxes.*—Granted to FRANCIS and JOHN STOCK, April 26, 1859. Hearing April 9, 1873.

23,810.—*Regulators for Time-Keepers.*—Granted to RALPH S. MERRIMON, April 26, 1859; reissued February 7, 1860. Hearing April 9, 1873.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,860.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,892.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,896.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,903.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tire.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,162.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHERBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

22,793.—*Improved Cracker-Machine*, granted to JOSEPH FOX, February 1, 1859; reissued May 4, 1869, numbered 3,415.

Claim.—1. The depressions in the spaces between the grooves in one or both of the rollers B and B′ that form the strips of dough from the sheet, substantially as and for the purposes hereinbefore specified.

2. The feed-bed of free rollers A′, in combination with the grooved rollers B B′, substantially as herein described and specified.

3. Moving the grooved rollers B B′, arranged with respect to each other, as herein specified, with a regular intermittent, or step-by-step motion, substantially in the manner and for the purposes hereinbefore specified and set forth.

4. The ways or guides E, in combination with the grooved rollers B B′, substantially as and for the purposes herein described and specified.

5. The perforated bar G, in combination with the ways or guides E, substantially as and for the purposes herein described and set forth.

6. The knife H, in combination with the perforated bar G, substantially as and for the purposes hereinbefore described and specified.

7. The rollers B B′, ways or guides E, perforated bar G, and knife H, all combined and operated substantially as hereinbefore specified.

8. Feeding the said strips of dough Y through the perforated bar G, and opposite the knife H, with a regular intermittent or step-by-step motion, in the manner and for the purposes hereinbefore specified.

9. Passing strips of dough Y through apertures in a plate or bar, G, and cutting of short sections of said strips by means of a sudden blow with a blade or knife, H, substantially in the manner and for the purposes hereinbefore described and specified.

10. The employment of the clamp-bars I I, in combination with the knife H, as herein described, to cut off and hold the sections of the strips of dough as the strips are fed through the bar G, as specified.

11. Forming short sections of skin-covered strips of dough into disks, or crackers, by pressure applied to the ends of the sections by the devices, substantially as herein described.

12. The rollers, substantially as described, by which the crackers are rolled on the apron, and by which the skin on the upper surface of the pressed crackers is completed.

13. Also, the straight edges R and R′, for evening the rows of crackers before rolling and docking, as specified, in combination with the rollers and dockers, substantially as herein described and set forth.

14. The combination of the docker O with the movable clearer-plate Q, and springs *g g*, substantially as and for the purposes herein shown and specified.

15. And, finally, the endless apron L, inclined plane T, follower U, and second endless apron S, all combined and operated substantially in the manner and for the purposes herein described and specified.

Approved by act of Congress, January 10, 1873, enabling him to make application to the Commissioner of Patents for the extension of his patent.

23,445.—*Improvement in Paper-Folding Machines*, granted to CYRUS CHAMBERS, Jr., April 5, 1859.

Claim.—1. The register-pins *e* and *e′*, so constructed and so attached to a paper-folding machine that they shall retain a position proper for the adjustment of the sheet, and yield by the movement of the latter.

2. Adjusting one of the register-pins *e′*, laterally and longitudinally, independently of the other pin by means of the slides n^1 and n^2, or their equivalents.

3. Adjusting both pins simultaneously, both laterally and longitudinally, by the frames X and Y, or their equivalents, the frame X being adjustable in one direction on the frame Y, and the latter, together with the frame X, being adjustable in another direction on the frame of the machine or any attachment thereto.

4. Any convenient number of rods, 1, 2, and 3, terminating at one of the folding-rollers, the ends of the rods passing into grooves in the said rollers, as and for the purpose specified.

5. The adjustable stop Z, with its inner edge of a curved or angular form, or otherwise so constructed that the end of the folded edge only of the sheet shall be in contact with the said stop, for the purpose specified.

6. The plunger 6 with its adjustable plate 8 in combination with the adjustable plate 9, said plates being arranged substantially as and for the purpose herein set forth.

7. The curved wires 15 and 16, or their equivalents, attached to the machine in any convenient manner, situated under the folding apparatus and adjacent to the trough, for the purpose specified.

8. The combination of an alarm or indicating apparatus with a paper-folding machine, when the said indicator is operated by a sheet folded by the machine.

9. Causing the sliding board *c′* to move along the trough with a diminution of friction as the folded sheets accumulate, by means of the springs 4 attached to the said board, and arranged to bear against the wedge-formed or inclined strips 5, substantially as herein set forth, and for the purpose specified.

23,536.—*Improved Pyrotechnic Night-Signal*, granted to MARTHA J. COSTON, administratrix of B. FRANKLIN COSTON, April 5, 1859.

Claim.—The signalizing of any numeral combination of numerals, or any character or combination of characters, by a methodical exhibition of different pyrotechnic fires, substantially as herein set forth.

23,436.—*Improved Machine for Wringing Clothes*, granted to SELDEN A. BAILEY, April 5, 1859; reissued June 28, 1864, numbered 1,710; reissued May 14, 1867, numbered 2,609.

Claim.—1. The employment of the wooden spring-piece *a a*, which is divided into two parts at its center, each part being slotted from the place of division, as shown in the drawing, toward its outer end, the same being covered by rubber cylinder, substantially in the manner and for the purpose specified.

2. The spring F, in combination with elastic rollers, for the purpose set forth.

3. I claim, in a wringing-machine, substantially of the kind herein described, the combination of elastic rollers impervious to water, with the standards B and vessel A, secured and operated substantially as and for the purpose specified.

23,525.—*Improved Bedstead-Fastening*, granted to LEVI W. BUXTON, April 5, 1859.

Claim.—1. The combination of the shoulders *j j* on the locking or rail piece *c* with the notched or serrated circular edges *l l* and conical pin *k*, substantially as and for the purposes set forth.

2. The combination of the hook *c′* with the tube or friction roller *f* and stationary pin *g*, substantially as and for the purposes herein described.

23,491.—*Improvement in Machinery for Laying Rope*, granted to GEORGE W. PITTMAN and W. C. BOONE, April 5, 1859.

Claim.—1. The laying and unlaying of the strands c^1 c^2 to forward the twist, as herein described.

2. The ring-guide *c′*, applied in combination with the bobbin c^2 to the nearest flier, substantially as and for the purpose set forth.

23,520.—*Improved Burnishing-Machine*, granted to LE ROY S. WHITE, April 5, 1859.

Claim.—1. So applying two burnishers in a burnishing-machine that they shall operate simultaneously at opposite points on opposite sides of the article or piece of work to be burnished, and burnish both sides at once, and that during such operation each shall serve to support the article or piece of work against the pressure of the other, substantially as herein set forth.

2. The combination of the reciprocating and partially rotating shaft C and yoke D, or their equivalents, and the tool-stock R, by means of the rods S S, the arm K, rod *l*, and arm *m*, the whole operating substantially as and for the purposes herein specified.

3. The sliding bars *n n′ p*, applied in combination with the tool-stock carriage to operate substantially as and for the purposes herein specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 25, 1873.]

6,512.—*Carpet.*—ALBERT COWELL, Kidderminster, England.

6,513.—*Carpet.*—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date March 25, 1873.]

ORIGINAL PATENTS.

137,045.—*Apparatus for Cleaning Horses.*—OSCAR W. ALLISON and PAUL HOMELIUS, Buffalo, N. Y., assignors to JAMES H. SMALL, same place.

Power is transmitted to a rotary brush by means of an endless belt running over a main driving-pulley, guide-pulleys, and a weighted tension-pulley; the belt being further guided by a tube having guide-rollers at each enlarged end; the tube being pivoted to the case containing the pulley and gearing immediately connected with the revolving brush.

Claim.—1. The combination, with the rotary brush G, pulley g', main shaft a, driving-pulley C, and loose pulley C', of the guide-pulleys F F, weighted tension-pulley H, and endless belt f, as and for the purpose hereinbefore set forth.

2. The combination, with the endless belt f and brush-pulley g', of the case I provided with guide-rollers i for securing the belt against displacement while the brush is being operated at any desired angle, substantially as hereinbefore set forth.

3. The combination, with the brush G, pulley g', and tube I provided with guide-rollers i, of the bearing K K' hinged to the tube I and provided with guide-rollers k, so as to enable the brushes to be swung vertically without impairing the transmission of motion, substantially as hereinbefore set forth.

4. The combination, with the main shaft a, driving-pulleys C C', and endless belt f, of the perforated guide D provided with friction-rollers d, substantially as and for the purpose hereinbefore set forth.

5. The combination, with the driving-pulley g' and shaft g, of two brushes arranged on opposite sides of the pulley g', substantially as and for the purpose hereinbefore set forth.

137,046.—*Washing-Machine.*—JAMES BALLARD, Almont, Mich.

To a wash box, with a series of rollers in the bottom, are attached two standards. At the top of these a rock-shaft is journaled, and to this two reciprocating standards are attached, which are provided with guide-rods, which pass through holes in the same. To the lower ends of the standards is secured a rubbing-board, which is moved by levers pivoted in slots of the reciprocating standards.

Claim.—The combination of the lever K with the rub-board J, reciprocating standards H with guide-rods I, hanging fulcrums L, and rock-shaft F, as described.

137,047.—*Tucker for Sewing-Machines.*—DANIEL BARNUM and EDMUND B. BARNUM, Brooklyn, N. Y.

The gaging-edge of the plate bears against the seam of a previously-formed tuck, and the cloth for the new tuck is folded about the outer or folding edge of the plate. Different-sized plates are required for different-sized tucks and spaces, and as the plate is connected with the independent spring-arms it yields to inequalities.

Claim.—1. The folding and gaging plate A with its edges, whether parallel or divergent, constituting the folding-edge C and the gage B, substantially as described.

2. The gage B, when supported substantially as described, so as to be self-adapting in its bearings on the cloth when disturbed by inequalities.

3. The folding-edge C, when supported substantially as described, so as to be self-adapting in its bearings on the cloth when disturbed by inequalities.

4. The gage K, constructed to run in the back of the seam being sewed to keep the material from dragging away from the needle, substantially as described.

5. The detachable gage B, when pivoted to the arm F, so that it may be detached therefrom, substantially as and for the purpose described.

6. The arm F, constructed with elastic prongs, for the purpose specified.

137,048.—*Bobbin-Winder for Sewing-Machines.*—ALEXANDER B. BARY, Detroit, Mich.

For moving and regulating the speed of the wrist-pin, which constitutes the thread-guide.

Claim.—In mechanism of the described construction, the combination of the grooved cone E, friction-wheel F, worm G', slotted gear-wheel I, slotted plate H, wrist-pin b, and springs J J, arranged as described, for the purpose set forth.

137,049.—*Collar-Pad.*—PETER H. BEAVER, Montandon, Pa.

The pad-tree is made of perforated metal and allows the air to circulate under the collar and over the neck of the horse.

Claim.—1. The combination of the pad-tree A with the pads C, shaped or constructed as described, whereby a clear space is left above the crown of the animal's neck to which the pad may be applied, as set forth.

2. The combination of the open straps E and buckles F with the pads C D and tree A, substantially as herein shown and described, and for the purpose set forth.

137,050.—*Railroad Switch.*—GEORGE W. BILLINGS, Chicago, Ill.

The switch-rails are re-enforced by the long elastic bent plates, the flanges of which serve to attach the connecting-bars to, and thus avoid perforating the flanges of, the rails. The re-enforcing plates are used to strengthen the main rails at the bend.

Claim.—1. The re-enforcing bars or rails F, constructed as described, in combination with the rails C, as and for the purpose set forth.

2. In combination with the rails B the re-enforcing side plates d, constructed as described, and for the purpose specified.

137,051.—*Seeding-Machine.*—DANIEL CAINE, Battle Creek, Mich.

The bottom of the seed-box is provided with an agitator, and the seed falls upon an inclined board, provided with pins projecting from its upper surface to scatter the seed.

Claim.—1. In a broadcast-seeding machine, the adjustable plate E having L-shaped openings G, in combination with the reciprocating clearer F and the hopper a provided with escape-orifices, when constructed, arranged, and operating as described.

2. The removable board I studded with pins i, and arranged at an angle below the hopper a, substantially as herein described and shown, for the purpose specified.

137,052.—*Die for Forming Wrench-Heads.*—LUKE CHAPMAN, Collinsville, Conn., assignor to THE COLLINS COMPANY, same place.

The bar is formed into a blank by a die in one piece, which has a vertical aperture sunk into it; the upper part of the aperture is enlarged and forms a triangular head on the bar. In a horizontal slot in the die a wedge is placed, on which the lower end of the blank rests. By driving the wedge in, the blank is started from the die and is easily removed. It is then placed in another die for completion. This die is countersunk to form the wrench-head, a properly-shaped plunger or upper die forcing the metal into it. In all other respects this die is similar to the above.

Claim.—1. The die a, constructed and designed for use substantially as described, for the purpose set forth.

2. The combination of the dies e and g, when constructed and designed for use substantially as described, for the purpose set forth.

3. The process of forming a wrench-head by first forming, by means of dies, a head upon the bar, substantially like c', and then completing the forging by means of the second set of dies, substantially as described.

137,053.—*Die for Forming Wrench-Heads.*—LUKE CHAPMAN, Collinsville, Conn., assignor to THE COLLINS COMPANY, same place.

The die is in one piece and has a vertical aperture corresponding to the size of the wrench-bar sunk into it. The die is countersunk to form the head. A bar the size of the wrench-bar is placed in the die, and a plunger of proper shape forms the head. The die is also slotted horizontally, and in this slot a wedge is placed, on which the end of the wrench-bar rests. When the wrench is completed in the die the wedge is driven in and starts the wrench and facilitates its removal.

Claim.—1. The die and plunger constructed and designed to act in combination, substantially as described, for the purpose set forth.

2. The combination of the die, the plunger, and the key, designed and constructed for use substantially as described, for the purpose set forth.

137,054.—*Rotary Pump.*—LUKE CHAPMAN, Collinsville, Conn., assignor to himself and WILLIAM J. WOOD, same place.—E.

The shell is formed of two intersecting hollow cylinders having bearings and boxes for the plunger-shafts made to work in opposite directions. The cylindrical valves are held to the plunger by being inserted in seats somewhat greater than a half-circle, and thus continually present new wearing-surfaces, and at the same time are firmly held in their seats.

Claim.—1. The yokes i, when used to connect the valves s, substantially in the manner set forth.

2. The combination of the two plungers of equal diameter, each having an equal number of valve-seats, the half of which are occupied by cylindrical valves loose in their seats, and the other half of which are for the reception of the valves carried by the other plunger, substantially as described.

3. The combination of the two plungers, the cylindrical valves free to turn in their seats, and the yokes connecting the valves set into the ends of the plungers, so as to be flush with the same.

137,055.—*Rotary Pump.*—LUKE CHAPMAN, Collinsville, Conn., assignor to himself and WILLIAM J. WOOD, same place.—C.

On the shafts are fixed plungers having four parti-circular valve-seats, for the reception of cylindrical valves pivoted at their ends upon round pins projecting from yokes fitting into corresponding beds in the ends of the plungers. As the plungers rotate, their surfaces are always in contact except at the valve-seats, and these are closed by the valves themselves, each valve borne by either plunger striking into an empty valve-seat in the other plunger.

Claim.—1. The combination of the cylindrical valve s with the plunger c when the valve is held to the plunger by being inserted in a valve-seat of a depth and outline somewhat greater than a half circle.

2. The combination and arrangement of the two revolving plungers c of equal size, having valve-seats of the shapes and relative sizes shown and described, with the cylindrical valves s.

137,056.—*Rotary Engine or Pump.*—LUKE CHAPMAN, Collinsville, Conn., assignor to himself and WILLIAM J. WOOD, same place.—A.

The revolving cylinder is provided with cylindrical valves covered by rubber or other elastic material, and fit into recesses into the cut-off. Rings placed in the heads of the case form the bearings of said valves and revolve with them. Grooves in the back of the rings, connected by holes with the steam or water space, serve as a lubricant and packing for the revolving rings.

Claim.—1. The rings g, when used to hold the valve in place, substantially as described.

2. The rings g, provided with the groove g^2 and the holes g^3, substantially as described, and for the purpose set forth.

137,057.—*Rotary Pump.*—LUKE CHAPMAN, Collinsville, Conn., assignor of one-half his right to WILLIAM J. WOOD, same place.—D.

An outer shell or case is formed by two hollow intersecting cylinders; the upper one contains the solid rotating cut off, which fits into the upper part; this cut-off is set upon and rotates with the shaft. The lower cylinder contains the solid rotating piston, which is of the same size as the cut-off, set upon and rotating with the shaft. The gearing causes the cut-off and piston to rotate simultaneously.

Claim.—The combination of the rotating cut-off, rotating piston, cylindrical valves hung in the plate or plates e, and the plate or plates i, all constructed and designed for operation substantially as described.

137,058.—*Rotary Pump.*—LUKE CHAPMAN, Collinsville, Conn., assignor of one-half his right to WILLIAM J. WOOD, same place.—E.

The outer shell of a double rotary pump is formed by duplicating the parts. The pistons are each provided with one or more cylindrical valves, each having a valve seat or seats for the reception of the valves carried by the other piston. The valve-seat takes in more than half the valve that rests in it, so as to keep the valves to the proper piston. They rotate simultaneously and are actuated by the gearing.

Claim.—The combination of the two duplicate parts $a\ b$ and $a'\ b'$, and the two duplicate rotary pistons d d^1, each equipped with one or more cylindrical valves, f f^1 g g^1, and each having a valve seat or seats for the reception of the valve or valves carried by the other piston, the whole constructed and designed to operate substantially as described.

137,059.—*Process for Treating Sewage and Ammoniacal Waters for the Production of Fertilizers, &c.*—THOMAS CHRISTY, Jr., and ALEXANDER BORROWNICKI, London, England.

Sewage and similar matters are treated with silica, either in the form of fluoride, hydrofluosilicic acid, or a soluble silicate. The agglomerate or gelatinous mass precipitated is exposed to the atmosphere for the escape of water. Fresh ammoniacal water is treated with silicate of soda or potash, an acid added, and the precipitated gelatinous mass exposed to the air for a while and then washed with an alkaline solution until exhausted. The drawings are treated with a salt of iron to produce a blue.

Claim.—1. We claim to treat ammoniacal and other liquids of gas-works, sewage, and other waters containing foreign matters in suspension or solution by hydrated silicate, in the manner stated, so as to obtain a raw product which we call silicoid.

2. We claim to operate on the product "silicoid" in order to separate from it cyanogen and other matters, and to treat the sub-products formed during the operations, substantially as described.

3. We claim to treat the ammoniacal waters from gas-works according to their condition—that is to say, to treat them either direct or after they have been concentrated under the form of silicoid, as described, for the purpose of extracting from them for commercial purposes cyanogenized, ammoniacal, and other substances contained in them.

137,060.—*Plow.*—THOMAS J. CLARK and GEORGE M. CLARK, Higganum, Conn.

Lateral wings are attached to the rear extremities of the mold-boards, either rigidly fixed or pivoted and pressed down by a spring. Marking-rolls are attached to these wings; the whole designed to flatten the top of the ridges and mark the hills for planting.

Claim.—A plow with either single or double mold-board, having a wing or wings, b b', either rigidly fastened thereto or pivoted thereto and pressed upon by a spring, all constructed, arranged, and designed to operate substantially as described, for the purpose set forth.

2. The combination of the plow with single or double mold-board, the wing or wings, b b', and the marking roll or rolls attached to the wings, the whole constructed, arranged, and designed for operation, substantially as and for the purpose set forth.

137,061.—*Burglar-Proof Safe.*—WILLIAM CORLISS, Providence, R. I.

The shell of the safe is made in two parts, which are screwed together, and a key or pin is inserted in the joint to prevent them from being unscrewed. The door is attached to a frame that revolves within the shell, and is moved forward and back by means of screws which hold the door in its closed position by bracing across the interior of the structure.

Claim.—1. A safe-shell, made in sections, each in a single thickness, and secured together internally by the screw-threads a and c, substantially as described.

2. The key i in combination with the threaded portions A C of a sectional safe, and serving as a means for preventing the turning of the sections upon each other, as specified.

3. The revolving frame J and door D with means for moving the same relatively to each other, arranged to serve within a safe, as herein specified.

4. The column-nuts W and screws K L, arranged as shown, in combination with a door, D, opening inwardly, so as to move the door forward and backward, and to hold it in the forward position by bracing across the interior of the entire structure, as specified.

137,062.—*Combined Chair, Table, and Lounge.*—JAMES CROGHAN, Chicago, Ill.

A chair with its back pivoted near its center, to the back of which is attached a table which can be brought into use by turning forward the chair-back, resting it upon the arms of the chair, which are attached to each side of the seat and arranged to turn down, and are supported and their action limited by segmental braces, notched to extend the width of the seat for a lounge. Under the seat is a frame on slides, which, when drawn out, form a bedstead supported by legs, &c., below which is a drawer for receiving the bed-clothing when not in use.

Claim.—The combination of an easy-chair, table, bedstead, and lounge, when the said several parts are constructed and arranged together, substantially as specified.

137,063.—*Die for Cutting out Ornamental Forms of Paper.*—ADOLPHE DELKESCAMP, Brooklyn, E. D., assignor to JACOB J. NICHOLS, New York, N. Y.

The pattern-die is supplied with many slender pins protruding through it and flush with its face, which are pushed up as the dies are brought together, and descending by gravity, as the dies separate, force out the delicate figure of paper. The waste material in the male die is removed by similar pins mechanically raised.

Claim.—In combination with dies A B, operating as specified, the clearing-pins m, sinking out of the way when the dies are acting and protruded when the dies are separated, so as to expel the thin material by acting on thickly-distributed points on its surface, as herein specified.

137,064.—*Forming and Gaging Butter-Rolls.*—CHARLES H. FANCHER, San Francisco, Cal., assignor to himself and FRANK A. J. DIBB, same place.

A mass of butter is deposited in a box and the surface made level. A frame, carrying a cutting-wire at its base and a movable gage-board above, is adjusted for the desired length of roll and moved from end to end of the box, the board resting on the butter. A bisected cylinder, opening and closing by means of pivoted handles, as of shears, is forced through this cake of butter, (transferred to a table,) and the portion embraced, or the roll, is lifted out. The fragments are consolidated in a suitable press and the operation repeated.

Claim.—The improvement in the art of forming and gaging butter-rolls by means of the striker, consisting of the frame A A B with its gage-board C and cutting-wire d, and the cylindrical cutting-mold G G', all constructed and arranged substantially as set forth.

137,065.—*Wheel for Road-Steamers.*—JAMES S. FISHER, Utica, Mo.

Steam is admitted through steam-pipes above and below the center to central openings and branch passages in the valves, which are provided with notches by which they are rotated by projections on the revolving rim. The steam is exhausted through a central opening in the stationary center. Stops are arranged in the casing, by which the valves are held stationary until released by levers, which pass over inclines on the rim.

Claim.—1. The valves D provided with notches d d and passages e e, as described, in combination with the stationary center A and revolving rim C forming the chamber E, said chamber provided with partitions b b, all substantially as and for the purposes herein set forth.

2. In combination with the wheel A C and valves D D, the steam-pipes B B with side ports f f and passages h h and the grooves k', passages k, and exhaust-port m in the wheel, substantially as and for the purposes herein set forth.

3. The combination of the spring-stops s s, rods i i, levers G G, and inclines s s, constructed and arranged, as described, to operate in connection with the wheel A C and valves D D, substantially as and for the purposes herein set forth.

137,066.—*Sole-Trimming Machine.*—BERNARD GALLAGHER, St. John, Canada, and JOHN COYLE, Belfast, Great Britain.

The two arms, supporting upon their outer ends cylindrical cutters, have reciprocating motion imparted to them by means of an adjustable crank-shaft, their opposite ends being guided over a form approximating the shape of the boot or shoe sole to be trimmed. Machinery adapted to both trimming and setting the edges of boot and shoe soles.

Claim.—1. The construction and arrangement of the pivoted arms *g g*, provided with the circular cutters *p q p q*, guide-pins 6 6, or their equivalents, and the shoe-guide *e*, as and for the purpose set forth.

2. In combination with the arms *g g* and cutters *p p*, the mechanism for operating the latter, consisting of the driving-pulley *k*, pulleys *l l o o*, or their equivalents, as herein set forth and described.

3. In combination with the pivoted arms *g g* and movable bar *d*, the operating-arm 5, curved bar 4, and pivoted last-holder 1 movable in the guides *w w*, in the manner and for the purpose set forth.

4. The combination of the spiral cutters *p p* and disk-cutters *q q*, when arranged to operate upon the movable arms in the manner as shown, and for the purpose described.

137,067.—*Car-Coupling.*—CHARLES H. GEARHART, Farmer City, Ill.

The draw-head adjusts itself to others of different heights by reason of its being divided and its lower half resting upon a yielding bar. The spring-hook engages with the link when the draw-heads meet, and is uncoupled by means of the lever and chain connecting with the brake-shaft.

Claim.—The combination of the draw-bar B supported by yielding-bar F, and having hook C; of the lever G, chains *g g'*, and shaft G', all substantially as and for the purposes set forth.

137,068.—*Apparatus for Brazing Metal Tubes.*—THOMAS G. GORMAN and NATHAN W. PERRIGOY, Springfield, Ill.

The crank-lever gradually winds the chain on the pulley, turning the shaft and raising the plug or spindle, carrying along with it the tube. In this way the various portions of the work are gradually brought in contact with the hottest part of the fire.

Claim.—1. A forge, in combination with the fluted plug or spindle D, substantially as herein described.

2. The chain F, pulleys I and D', shaft H, pawl L, ratchet G, and crank G', for raising and depressing the spindle D, for the purposes herein described.

3. The circular opening in the hearth B, tuyere K, bottom C, and hole C', substantially as herein described, and for the purposes herein set forth.

137,069.—*Reclining-Chair.*—GEORGE D. GOSS, Boston, Mass.

To the chair-frame is hinged the back, to each side of which is pivoted one end of a rod, the other end of which fits into notches in a rack attached to the under side of the arm-rest.

Claim.—The back C, hinged or pivoted to the seat or frame of the chair, in combination with the rods *c* and racks D, constructed and operating substantially as described.

137,070.—*Steam Lubricator.*—WILLIAM GOWENLOCK, Susquehanna Depot, Pa.

Two or more hollow branch tubes attached to the hollow valve-stem within the heating-chamber so as to allow the steam to heat the parts of the lubricating material more remote from the central valve-stem.

Claim.—In combination with the hollow valve-stem of the lubricator of the class herein described, two or more hollow branches, *c c*, attached to the stem, substantially as and for the purposes herein set forth.

137,071.—*Cartridge Capping and Uncapping Device.*—GEORGE S. GREENE, Jr., Mott Haven, N. Y.

Claim.—1. The cartridge-case mover or chair E, or its equivalent, provided with means for grasping the cartridge-case by the rim, combined with a longitudinally-fixed screw, G, forming an abutment for capping the case, in connection with the guide or holder B, pin *h*, and cap *g*, all arranged and operating substantially and for the purposes specified.

2. The vibrating cartridge-case guide B, combined with a chair or cartridge-case mover E, substantially as and for the purposes specified.

3. The perforated removable cap *g*, in combination with the pin *h* and guide B, substantially and for the purposes specified.

4. The combination, with the guide or holder B, of the removable pin-holder *g*, whereby the instrument is adapted to be used with cartridges of different construction, as specified.

137,072.—*Manufacture of Boracic Acid.*—FREDERICK GUTZKOW, San Francisco, Cal.

Powdered borate of lime is sprinkled with dilute sulphuric acid and the stiff pulp is mixed with half its weight of ordinary coke to give the mass porosity. Superheated steam is then passed through the mass.

Claim.—The separation of boracic acid from borate of lime by distillation with superheated steam, substantially as set forth and described.

137,073.—*Steam Lubricator.*—WILLIAM HAMILTON, Erie, Pa.

The lubricating tube, extending horizontally through the cup, has at its extremity a conical valve-seat, through which passes the brass pointed valve-spindle, which regulates the flow of oil and keeps the valve-seat open.

Claim.—1. The hollow or tubular bolt D having orifices *d d*, and metallic point H' having cone-shaped opening *h*, spindle or needle G having a tapering point, *g*, the whole being so combined and arranged that the valve-spindle not only regulates the flow of the lubricant by its projecting point, but also serves to keep the discharge-orifice *g* open, substantially as described.

2. The adjustable steadying-plate K', socket K, recess *a'*, and set-screw *k*, when the same are so combined and arranged as to operate substantially as described.

137,074.—*Meat-Chopper.*—JOSIAH A. HARD, Lawrence, Kan.

A train of gearing operates a pitman and a vertical shaft, carrying, at its lower end, transverse knives cutting vertically. The bracket, affording guides to this shaft, presents an annulus of spears or wedges to a spur on the side of the shaft, which causes a partial rotation in the shaft and knives at each ascent thereof.

Claim.—1. The construction and arrangement, with relation to the spindle J, of the oscillating head K and knives L L' secured thereto, in the manner and for the purpose set forth.

2. The crown-teeth *e* on the bracket B', and the pallet *f* and stud *h* on the spindle J, for imparting to the latter an axial rotation during its reciprocation, substantially as shown and set forth.

137,075.—*Apparatus for Teaching Mensuration.*—ISAAC HARRINGTON, Huntington, assignor to himself, W. E. DOWNS, and THOMAS L. CORNELL, Birmingham, Conn.

Claim.—A series of blocks constructed and hinged together, and arranged to be transposed at will, without disconnecting the same, substantially as described and shown, whereby squares, triangles, and other forms known to geometry may be represented for the purpose of teaching and proving the rules of mensuration by ocular demonstration.

137,076.—*Bolt-Cutter.*—WILLIAM W. HILL, Fulton, N. Y.

Claim.—1. The bolt cutter and trimmer composed of the blades A A, fulcrum bars or plates B B, lever-handles C C, and fulcrum bar or plate D, pivoted together and operating substantially as herein specified.

2. The pin *h*, in combination with the notched jaws, substantially as and for the purpose herein specified.

137,077.—*Loom.*—CHARLES J. KANE, Milford, Conn.

For weaving narrow goods. The shuttle is reciprocated in the arc of a circle by the drivers, which reciprocate through the oscillating hub H. The drivers are engaged and disengaged with the shuttle by means of the cam.

Claim.—1. The oscillating and longitudinally-sliding shuttle fingers or drivers G G, arranged in relation with each other and with a circular raceway for operation, in combination with a curvilinearly-reciprocating shuttle, substantially as specified.

2. The combination of the curvilinearly-reciprocating shuttle B, provided with slots or guides *u u* on its inner side, the circular raceway A open above and below, and the oscillating and longitudinally-sliding shuttle fingers or drivers G G, the whole being arranged for operation, in relation with each other and with the warp, essentially as shown and described.

137,078.—*Plow-Clevis.*—AUGUST KAUFMAN, Davisville, Cal.

The direction of draft can be shifted without stopping the team.

Claim.—The clevis *r*, with its lever-handle *o*, in combination with the rack *m*, substantially as and for the purpose described.

137,079.—*Car-Brake.*—JOHN L. KNOWLTON, Sharon Hill, Pa., assignor of one-half his right to WILLIAM E. WALTON, same place.

Forcing down the foot-rod applies the brake-shoe to the friction-disk, and also a friction-roller is brought into contact with the friction-disk, and thereby revolved, winding up a chain which is connected to the brake-bars.

Claim.—The combination of the friction-roller C, shoe F, connecting-rod G, and small pulley D, arranged substantially as described, for the purpose specified.

137,080.—*Toy Gun.*—ALFRED JAMES, Chicago, Ill.

Claim.—In a toy gun the combination of the stock B, provided with a dovetail-groove, the sliding head *c* provided with the shoulder *c''* and fitted into the dovetail-groove of the stock, the bent spring-catch D engaging the shoulder *c''*, and the pivoted trigger E engaging the catch D, all arranged to operate together substantially as shown and described, and for the purposes specified.

137,081.—*Duplex Ticket.*—THOMAS A. JEBB, Buffalo, N. Y.

Employed in the collection of passenger fares and charges for excess baggage on railroads, and adapted for other uses, as the collection of fares on bridges, steam-boats, &c.

Claim.—A folded duplex ticket in which one part or half (as the passenger's) is conspicuously distinguished from the other by being of a different color, or by containing a prominent figure or design of a different color or appearance from that of the rest of the ticket or the other half thereof, substantially as hereinbefore set forth.

137,082.—*Water-Closet.*—JOSIAH GEORGE JENNINGS, Palace Wharf, Stangate, England.

Claim.—1. The non-corrosive valve-seat *c* in the described combination with the valve *d* and its lifting apparatus, bracket *m*, and water-supply valve *f*, as shown and explained.

2. The siphon-trap *a*, with a side opening or socket, a^2, in the ascending limb thereof, to which a pan, *b*, is adapted, substantially as herein described.

137,083.—*Wheel for Vehicles.*—PHINEAS JONES, Newark, N. J.

Claim.—In a carriage-hub in which the mortises to receive the spokes are formed in a metal band, constructing the said mortises with corrugations parallel to the axis or concentric thereto, to receive a common tenon, which, by expansion, fills the said corrugations, substantially as and for the purpose set forth.

137,084.—*Flavoring, Coating, and Putting Up Tobacco.*—JAMES KERR, Boston, Mass., assignor to WILLIAM H. TOWERS, same place.

Tobacco formed into blocks or lumps, coated with mucilage after partly dry, over the whole with powdered sugar flavored with pleasant extracts.

Claim.—1. The improved process herein described for flavoring and putting up tobacco, the same consisting in forming it into small pieces, covering these with mucilage or gum and sugaring, as set forth.

2. The improved article of manufactured tobacco, coated, flavored, and put up for use, as set forth.

137,085.—*Railroad Frog.*—JOHN H. LAKEY, Turner, assignor to GEORGE W. BILLINGS, Chicago, Ill.

The point rails of the frog are held together by means of broad flat keys, in place of the usual round bolts, with the object of better resisting the shearing action of the rails under pressure.

Claim.—The broad flat key or keys, as above described, in combination with the rails B C of a railway frog, substantially in the manner as and for the purpose set forth.

137,086.—*Hand-Truck.*—HENRY S. LA TOURETTE, New Orleans, La.

Upon either end of an ordinary hand-truck are secured wooden cross-pieces having grooves in the center of each, and of such height that the truck, when used for the transportation of railroad rails, to which it is especially adapted, each end of the rail will be carried clear of the ground.

Claim.—The cross-bars A and B when provided with the shoulders *a* and grooves *b*, and when the said cross-bars are employed upon a hand-truck, as and for the purposes herein set forth.

137,087.—*Table-Leaf Support.*—AUGUST MARCHAND, Lyons, Mich.

To the under side of the leaf a fly or brace is secured by means of a screw passing through the brace into an intervening plate, and then into the leaf. A coiled spring is interposed between the brace and plate, so arranged that when the leaf is raised it will cause the brace to partially rotate on its screw-pivot and project under the leaf to sustain the same.

Claim.—The fly or brace E, plate F, spring G, and hook-stop I, in combination with the screw-head J, table-rail H, and fall-leaf, when the parts are specifically constructed and arranged to operate as and for the purposes set forth.

137,088.—*Amalgamator.*—FREDERICK MORRIS, San Francisco, Cal.

The muller and bottom of the tub are made of wooden blocks placed with the grain vertical, so that the wear will be upon the end of the grain. The depressed strips form channels for conveying any free mercury to the outer annular groove. The tailings are siphoned off from near the center of the vessel.

Claim.—1. The tub or vessel A, having its bottom covered with wood placed with the grain vertically, and having the depressed radial strip *d d* and outer annular channel *f*, substantially as and for the purpose above described.

2. The tub or vessel A, having its bottom covered with wood placed with the grain vertically, in combination with the wooden muller G, substantially as and for the purpose above described.

3. The siphon A, in combination with the settling-vessel A, substantially as and for the purpose above described.

137,089.—*Lead-Pencil.*—THEILE H. MÜLLER, Yonkers, N. Y.

Provided with a longitudinal cavity, in which a file is inserted, with its handle forming the tip.

Claim.—The herein-described pencil, consisting of a sheath containing a lead, substantially as described, and formed at the rear end with an enlarged cavity containing a file, the handle of which constitutes the stopper or head of the sheath, as set forth.

137,090.—*Treadle.*—JOHN H. OSBORN, Guelph, Canada.

The treadle is suspended, and is adjustable, so that it can be moved and held at different angles, enabling the operator to alter the position of his feet.

Claim.—The combination of the foot-rest C, hangers D D, pins or pivots E E, thumb-screws F F, and legs A A, forming an adjustable treadle, substantially as and for the purpose hereinbefore described.

137,091.—*Tilting-Chair.*—FREDERICK A. PARKER, Gardner, Mass.

The seat-portion is provided with convex curved ribs, fitting to and operating with concave curved ribs on the supporting-frame.

Claim.—A tilting-chair consisting of a seat-portion provided with convex curved parts B B, in combination with a supporting-frame or base provided with concave parts C C, curved to correspond with the parts B B, said parts fitting and operating together substantially as shown and set forth.

137,092.—*Power-Hammer.*—SAMUEL PENNOCK, Kennett's Square, Pa.

The hammer can be adjusted at will to not only vary the force of the blow but also the length of stroke. The upper end of a pitman is pivoted eccentrically to the usual disk on the main shaft, while from the lower end of the pitman a circular arm extends horizontally through the hammer-slide. Pivoted to this arm is a crank, which, by means of a spring, forces the arm to the right. Rods connect the treadle with the spring, so that the foot on the treadle governs the position of the curved arm, and thus the length of stroke.

Claim.—1. The combination of the pitman, radius-link crank-arm, rocking disk, and slide-bar, substantially as set forth.

2. The combination of the pitman, radius-link, crank-arm, slide-bar, counterbalance-spring, and foot-treadle, substantially as set forth.

3. The combination of the radius-link, the pitman, and the adjusting-disk in the wheel which drives the pitman, substantially as set forth.

4. The combination of the slide-bar, the hammer-bar, and the adjustable spring connection between them, these parts being constructed and operating substantially in the manner set forth.

137,093.—*Compound and Apparatus for the Cure of Asthma.*—JEANBAPTISTE PINCHARD, San Francisco, Cal.

Claim.—1. The compound formed of the following materials in their respective relative proportions: Alum sixty grains, gum acacia twenty-seven grains, and camphor three grains, the whole mixed with or without the saturation of six cubic feet of oxygen gas, substantially as and for the purpose hereinbefore set forth.

2. The oval-shaped apparatus A A A, provided with a cover, C, interior brush B actuated by the handle H, mouth-piece M, and valve *v*, substantially as and for the purpose hereinbefore set forth.

137,094.—*Cultivator.*—ORLANDO M. POND, Independence, Iowa.

A device for regulating the depth of the plows, and an adjustable clamp for holding the shovel-arms.

Claim.—1. The forked hook *a* with projecting circular prong *b* to form an adjustable connection between the tongue D and shovel-beams E, substantially as herein set forth.

2. The combination of the flanged plate H, concave ratchet-piece I, eyebolt A, and shaft *i*, with ratchet-pinions *k k*, to which the clamps for holding the shovel-arm are attached, substantially as and for the purposes herein set forth.

137,095.—*Combined Hose-Pipe and Sprinkler.*—WILLIAM W. RANSOM, Buffalo, N. Y.

A perforated sprinkling-disk having a hole in its center corresponding to the opening through the neck of the sprinkler, and closed by a sliding valve.

Claim.—The combination, with the sprinkler A, of the hole D and sliding disk E, substantially as and for the purpose described.

137,096.—*Collar.*—GEORGE F. RICE, Worcester, Mass.

The collar is not disarranged by the turning of the head, and the tie and scarf are prevented from working up over the collar.

Claim.—The collar A having its ends formed with notches or depressions B and projections D E, substantially as described and shown, whereby said ends can be locked against each other when the collar is worn, as and for the purpose set forth.

137,097.—*Low-Water Alarm and Indicator.*—JOHN ROSS, Greenville, Mich.

Upon the falling of the water the peculiarly-shaped float depresses an arm, which, by means of shaft extending outside of boiler, moves a hand over dial, and through adjustable arm releases a weighted rod and opens valve to steam-whistle.

Claim.—The cranked shaft E journaled through the stuffing-box *b* and bracket, the rod F, float G, the dial-case H supported by the rods *d d'*, and the index *c* at the end of the shaft E, all arranged to operate as a water-indicator, substantially in the manner described.

2. The weighted rod D provided with the catch *a* suspended from the lever of an alarm-whistle, and the adjustable cam *e* on the shaft of the water-indicator, arranged to operate in the manner and for the purpose set forth.

137,098.—*Hand-Cultivator.*—GEORGE W. RUE, Hamilton, Ohio.

A frame mounted on a single wheel. To the front of the frame are attached the handles, and to the rear another triangular frame, with holes to carry one or more standards, to which a variety of interchangeable cultivating-tools are fastened.

Claim.—The combination of front frame *a a* with frame B, or its equivalent, so constructed as to admit of the use of one or more of the standards *b*, upon which either of the interchangeable tools D E H M may be secured, substantially as described, for the purposes specified.

137,099.—*Earth-Closet.*—ISAAC S. RUSSELL, New Market, Md., and HENRY R. RUSSELL, Woodbury, N. J.

The discharger consists of a grate and two slides, connected directly under the earth-reservoir and operated by the raising and lowering of the seat-lid. A table is connected to a vertical shaft, to the rear of the seat, upon which is placed the earth-receptacle, so when the seat-lid is lowered the earth-receptacle is in position under the seat-opening, and when closed the table carrying the receptacle is brought under the discharger, allowing the contents of the discharger to fall into the receptacle.

Claim.—1. The vertical shaft *f* and loosely-hung table T, in combination with seat-lid, as described.

2. A discharger, consisting of the grate G and two independently and alternately moving slides provided with slots, as described, in combination with the vertical shaft, arm *n*, and finger I, as and for the purposes set forth.

3. A loosely-hung horizontal table attached to a vertical shaft, in combination with the arm or clutch H, catch 2, wedge 3, and stops 4 and 5, so that the shaft may have a limited motion relative to the table, as described, and for the purposes set forth.

4. In combination with the seat-lid, shaft *f*, and arm *n*, the swinging table provided with a dust door and receptacle, W, as and for the purposes set forth.

137,100.—*Tailor's Pressing-Machine.*—ALVAH C. SAWYER, Canton, N. Y.

The lever is pivoted underneath a table. To one end of it is hung a weight, and to the other is attached the back of the treadle-bar, which connects the treadle with the flexible arm holding the goose. A straight bar holds the treadle-bar in place by connecting it with the frame of the table. The back of the treadle-bar receives a vertically reciprocating motion.

Claim.—The lever I, parallel rod B, in combination with the vertical reciprocating back R E, substantially as and for the purpose set forth.

137,101.—*Organ-Treadle.*—JOHN A. SMITH, Erie, assignor to NEW ERA ORGAN COMPANY, North East, Pa.

The treadle is made adjustable to accommodate to players of different stature.

Claim.—1. The treadle B, in combination with the webbing or strap J, constructed, attached, arranged, and operated substantially in the manner and for the purposes shown and described.

2. The ratcheted bracket C, constructed substantially as described, and for the purposes set forth.

3. The ratchets G F E D, in combination with the shaft H and adjustable treadle B, as shown and described.

4. The roller M, in combination with the treadle B and strap J, as shown and described.

5. The lever P, in combination with the shaft H and adjustable treadle B, as shown and described.

137,102.—*Reed-Organ-Stop Action.*—JOHN A. SMITH, Erie, assignor to NEW ERA ORGAN COMPANY, North East, Pa.

Any stop is returned by the same motion upon the same lever as drew it out. It is effected by a one-toothed ratchet and pawl. The stop-register has oscillating tablets differently entitled, and operated by above devices.

Claim.—1. The actuating-levers F E D C, being the levers in immediate connection with the operator, connected with the levers R, being the lever in immediate connection with the several stops, by means of such levers, pawls, hooks, and connecting rods as shall cause like movements of the said levers F E D C to produce opposite results upon the levers R, substantially as and for the purposes shown and described.

2. The actuating-levers F E D C, severally connected with the proper levers, pawls, hooks, &c., operating substantially as described, that various alterations of the positions of the various stops may be accomplished by one movement of the knee or other member upon two or more of the said levers, as shown and described.

3. The lever E and accompanying pawl J, in combination with the lever R and wire O, as shown and described, for the purposes mentioned.

4. The lever E and accompanying pawl J, in combination with the hook V, pawl L, and lever R, as and for the purposes mentioned.

5. The pawl L and hook V, operated as described, for the purposes set forth.

6. The tumbler K, constructed as described, and in combination with the lever R, connecting rod G, and tumbler S, as shown and described.

7. The tumblers S, constructed and operated to display the tablets indicating the positions of the stops.

8. The tumblers S, in combination with the cylinder B, as shown and described.

9. The stop-register indicating the positions of the various stops of the organ by means of oscillating tablets, as shown and described.

137,103.—*Whiffletree Attachment for Vehicles.*—ANTOINE SOURSIN, St. Louis, Mo.

Claim.—The combination of spring-collar E, formed with a ring, E', and united at its bottom by ears $e e^1$, screw-bolts e^2, bolt F, clip D, draw-bolt C of tapering form and having head c, arranged to operate as and for the purpose set forth.

137,104.—*Machine for Grinding Metal Castings.*—GEORGE H. SPENCER, York, Pa., assignor to himself and GEORGE P. SMYSER, same place.

The swing-frames, horizontal grinding-rollers, vertical grinding-rollers, and horizontal arm, the treadle by means of which the horizontal rollers are operated, and the operative mechanism, pulleys, belts, cranks, &c. The work rests on table or sliding plate, to which it is fastened, and on which it is moved up between the grinding-rollers until the edge comes against the vertical roller.

Claim.—1. The combination of the swing-frame, the grinding-roller mounted therein, the pulley on the axis of the swing-frame, and the belt for driving the grinding-roller, these members being constructed and operating substantially as set forth, to apply the grinding-roller to the work without slackening the driving-belt.

2. The combination of the two swing-frames, the crank-wheels, the links connecting the two frames to the crank-wheel, and the treadle mechanism for operating the crank-wheels, these members being constructed and operating substantially as set forth, simultaneously to move the upper and lower rollers toward or from the work.

3. The combination of the vertical grinding-roller, its horizontally-swinging arm, and the driver-pulleys swinging with said arm, substantially as set forth.

4. The combination of the vertically-moving grinding-rollers with the horizontally-moving grinding-roller, these members being constructed and operating substantially as set forth, simultaneously to smooth three sides of the casting.

137,105.—*Horse-Collar Fastening.*—ELIAS H. SPRAGUE, Mount Vernon, Ohio.

The ends of the collar are lined with a metallic lining so as to more properly secure the cape, which are fastened together.

Claim.—The interior casing R, placed between the padding and covering on the end of a horse-collar, and fitting inside of an exterior casing, substantially as and for the purposes herein set forth.

137,106.—*Clasp for Preventing Ingrowing of Toe-Nails.*—EDWARD E. STEDMAN, Ravenna, Ohio.

Two small hooks are connected together by a bent spring. The hooks are carefully polished and flattened so that they may be inserted under the corners of the ingrowing nails without great irritation to the tender parts. The spring can be bent to fit a wide or narrow nail, and assist in drawing up the nail-corners out of the flesh.

Claim.—The attachment of a spring, connecting the two hook, which pass under the corners of the nail, as above specified.

137,107.—*Adding-Machine.*—ARCHIBALD M. STEPHENSON, Manteno, Ill.

The successive pin-wheels for giving the decimal counts are placed at regularly-diminishing distances apart, (counting from the units-wheel,) so as to allow the arms to engage only with the pins or teeth of the wheel on the advancing side, which arrangement, together with an alternate elevation and depression of the said tripping-arms, permits the count-wheels to be placed compactly in the same plane.

Claim.—The disks provided with figures, as described, and placed at a gradually-decreased distance from each other, and provided with arms of a corresponding decreased length, said arms being alternately raised and depressed to avoid interference, all arranged substantially as and for the purpose herein specified.

137,108.—*Tuck-Creaser for Sewing-Machines.*—JAMES T. STEWART, Philadelphia, Pa.

The marker is attached to the outer end of the frame pivoted to the supporting-arm, is moved upward about its pivotal point by a spring coiled around the arm and frame, and is pressed down so as to crease the fabric by the needle-bar, which strikes the lever, the latter being laterally adjustable for tucks of various widths.

Claim.—1. The operating-lever F connected to and sliding on both the supporting-arm C and frame D, substantially as and for the purpose described.

2. The frame D supported at both ends on the arm C, in combination with the marker E fixed to the frame and the operating-lever F sliding thereon, substantially as and for the purpose described.

3. In combination with the screw-plate A, the elevated and overhanging plate J and the screws g and h, to operate with the sliding pieces B and H, and hold them in position, as set forth.

137,109.—*Rotary Steam-Engine.*—WILLIAM C. STILES, Nevada City, Cal.

Both the force and the expansive power of the steam are exerted to drive an endless chain or belt and produce a rotary motion of the pulleys over which the belt passes, and from which power can be taken.

Claim.—1. The pulleys B B' and endless band D, with the pistons $e e e$, in combination with one or more cylinders, F, provided with suitable means for the ingress of steam, and sliding abutments, substantially as set forth.

2. The extended springs or levers with their arms $l l$, in combination with the projections m for automatically separating the abutments, substantially as described, for the purpose specified.

137,110.—*Method of Heating Photographic-Negative Baths.*—HARRY J. SUNTER, Buffalo, N. Y.

Claim.—1. The method of heating negative or other photographic baths or solutions for sensitized plates or paper coated with a preparation of collodion or albumen, by means of steam generated in a suitable apparatus and injected into said bath, &c., substantially as and for the purpose set forth.

2. The method of heating negative or other photographic baths or solutions used for sensitized plates or paper coated with a preparation of collodion or albumen by means of steam and the vapor of aqua-ammonia injected into said baths, &c., substantially as and for the purpose set forth.

137,111.—*Windmill.*—GEORGE A. SWARTZ, Twin Grove, Wis.

The turn-table is provided with an interior collar or ring, which is capable of turning within and independently of the turn-table, and will also turn with the same. The collar is provided with a frame, which supports the shaft to which the wheel is attached. By means of ropes and pulleys the collar and frame may be turned so as to bring the wheel into the wind or carry it out of the wind. The rope may be attached to a heavily-weighted lever, which is supported upon a hook that is pivoted upon the side of a tank having a lid with a projection. As the tank fills with water from the pump operated by the wheel the lid rises and pushes up a lever so as to release the weighted lever, which, falling, pulls the rope and throws the wheel out of the wind.

Claim.—1. In a windmill, the arrangement of the wheel and shaft upon a separate frame swinging upon and independent of the turn-table carrying the vane, substantially as and for the purposes herein set forth.

2. The combination of the turn-table A with vane B and arms C D, ring or collar E with frame G, carrying the shaft H and wheel I, ropes a b, and pulleys d d' and e e', all constructed and arranged to operate substantially as and for the purposes herein set forth.

3. The combination of the tank K, lid L with projection i, lever P, hook h, and weighted lever J, all substantially as and for the purposes herein set forth.

137,112.—*Refrigerator.*—ROBERT TAYLOR, New York, N. Y.

A refrigerator constructed so as to allow the air to circulate entirely around the provision-chamber without coming in contact with the food contained therein.

Claim.—1. The air-space s made in relation to openings d, f, k, L, and E, that the external air is made to circulate upward all around the food and ice chambers without entering either, substantially as set forth.

2. The inverted pans h, in combination with the gutter I and waste-pipe J.

3. The holes k and L, whereby ventilation is effected, as and for the purposes set forth.

137,113.—*Game-Table Tops.*—GILES G. THOMSON, New Haven, Conn.

For playing card-games on railroad cars, steamboats, &c.

Claim.—The table A, provided with the slides a b, having a cribbage and pitch-board upon their under surfaces, in combination with receptacles beneath, substantially as and for the purpose specified.

137,114.—*Machine for Cutting Biscuit.*—JOHN TURNER and SYDNEY TURNER, Toronto, Canada.

To the ordinary biscuit-cutting device, which is rigidly attached to uprights or guides, is a bent or crooked lever extending, for motion, to the main shaft, on which is connected a cam, so arranged that in its revolution, after the cutting is effected, to produce a partial stop or hesitating motion for the release of the dough or biscuit.

Claim.—Attaching the cutter-pan J in a solid manner to the movable spindles H, and, by the combination of the links I, short levers C, rocking-shaft F, and lever E, imparting to the said cutter-pan a hesitating motion, substantially as and for the purpose specified.

137,115.—*Mechanical Movement.*—ADDISON G. WATERHOUSE, Portage, Wis., assignor to WATERHOUSE MANUFACTURING COMPANY, same place.

Two concentric wheels are fixed to one shaft, and engaging on the opposite sides of a double-faced rolling wheel, arranged to be free to change its plane so that all points of its toothed or friction surfaces can come in contact with the wheels attached to the shaft.

Claim.—1. The combination of the three wheels A, B, and C, substantially as and for the purposes hereinbefore set forth.

2. The combination of the oscillating coupling w with the wheels A, B, and C, substantially as and for the purposes hereinbefore set forth.

3. The combination of the swinging arm s and the crank m with the wheels A, B, and C, substantially as and for the purposes hereinbefore set forth.

137,116.—*Mill-Pick.*—THOMAS R. WAY, Springfield, Ohio, assignor of one-half his right to WILLIAM H. REEVES, same place.

The small clamp may be unscrewed and set further down toward the point of the pick as the cutting-edge wears away.

Claim.—1. The arrangement of eccentrics d and d' with springs e and e', blade b, and head a, as shown and described, as and for the purpose hereinbefore set forth.

2. Ears or lugs m m on the head, when the same are used as bearings for eccentrics or other clamping device, in the manner shown and described, as and for the purpose set forth.

3. Handle c, with its reversible sides s' and c'', of different inclinations, in combination with collar s' and the clamping device, heretofore described, consisting of the eccentric d'' and spring e''', arranged in the manner shown and described, as and for the purposes hereinbefore set forth.

137,117.—*Printing-Telegraph.*—CHARLES J. WILEY, New York, N. Y.

Two slotted type-cylinders, one locked, while the other is free to revolve, the locking of either being under control of operator at a certain point in their revolution. Ratchet-wheels, giving step-by-step motion, having teeth on both sides and face of circumference, with proper holding and actuating pawls.

Claim.—1. The combination of the slotted type-cylinders H H with the vibrating arm or bar M, and its prongs m m, operated so as to arrest or release either cylinder, as desired, so that the one released is rotated by the two sets of magnets E E E E, arranged in the same circuit, all constructed and operating substantially as set forth.

2. The vibrating arm M, the horizontally-vibrating plate 9, and the sliding boxes having heads 12, and operated by the revolving fingers or pointers 13, combined with the cylinders and armature-levers O O, constructed and operating substantially as and for the purposes set forth.

3. The combination of the forked pawls 1 1, the ratchet-wheel, toothed on opposite sides, the springs or clicks 2, and detents 3 and 4, for regulating the step-by-step motion, substantially as set forth.

4. The square guide-frame 23, and pressure plate or spring 22, for guiding and regulating the paper ribbon, constructed and arranged substantially as set forth.

137,118.—*Carpet-Fastener.*—ALFRED J. WILLIAMS, Seneca Falls, N. Y.

A curved plate and a flat plate are hinged together. The flat plate is secured to the floor, and is provided with upward-projecting hooks to hold the carpet. The curved plate is turned down to conceal the hooks and the edge of the carpet.

Claim.—The carpet-fastener H, consisting of the plates A and P, joint j, hook h, and screw or nail s, constructed and arranged substantially as herein described.

137,119.—*Toy.*—WILLIAM R. WITHERS, Newark, N. J.

A miniature fan-blast is used to support a pith ball.

Claim.—The use of a miniature fan-blower in combination with a ball or balls, figure, or image, (of light material,) for the purpose of holding the said ball or balls, figure, or image suspended in mid-air by the current or currents of air produced by the said miniature fan-blower, when a sufficient motion is imparted thereto, thus constituting a toy for the amusement of children or others, substantially as hereinbefore described.

137,120.—*Post-Driver.*—ISAAC V. ADAIR, Romulus, N. Y.

The hammer is actuated by a cam on a windlass-shaft, which is driven either by horse or manual power. The windlass is supported in a spring-frame to ease shocks. The frame can be inclined laterally on the rocker bearings to allow the hammer to deal vertical blows, although the wagon should stand inclined.

Claim.—1. In a post-driver, the narrow frame B resting on false bolsters a a and having curved tenoned end pieces d d, constructed, and applicable to the running-gear of a wagon, as and for the purpose described.

2. The windlass-frame D of a post-driver, connected at one end by a hinge-joint, A, and at the other by a spring, i, as and for the purpose set forth.

3. The combination, in a post-driver, of a rocker-frame, B, frame D pivoted thereto, cam and shaft C f, and hammer-shaft E, constructed and arranged substantially as and for the purpose described.

137,121.—*Children's Swing.*—WILLIAM H. ALCORN, West Hoboken, N. J.

The child, by pulling upon the reins, oscillates back and forth in a nearly horizontal plane.

Claim.—The combination of the levers F and pivoted connecting-rods E with the stationary frame A and with the seat or carriage D suspended by pivoted bars or cranks B from said frame A, substantially as herein shown and described.

137,122.—*Brick-Machine.*—RICHARD T. BANTON, New Haven, Conn.

The clay from the pug-mill is fed into molds in the rotating mold-board, and is successively pressed and condensed by plungers, and the brick then ejected by the pusher, all during the onward intermittent rotation of the mold-board.

Claim.—1. The rotating mold-board H, in combination with the successive pressing devices D F G D^1 F^1 G^1 D^2 F^2 G^2, substantially as herein described.

2. The arrangement of the cams C C^1 C^2, K K', and P, the levers D D^1 D^2, L, and R, the bars M m and Q, and the wheel O, and springs E E^1 E^2 and T, for producing the described motions of the mold-board, the pressing-blocks, and the discharging device, substantially as specified.

137,123.—*Air-Pump and Engine.*—THOMAS BEACH, Freeport, Pa., assignor of one-half his right to JOHN C. MCCLELLAND, same place.

To the under side of a revolving plate, in the bottom of the reservoir, are attached, in circular order, a series of air-pumps. Above the revolving plate is a fixed plate, in which are two apertures—one for admitting air from the pumps, the other for supplying air to the pumps—the latter being covered with an inverted air-receiver, communicating with the exhaust of the engine. The stroke of the pistons of the pumps, which are operated by racks and pinions, is so regulated that as the down-stroke of the piston commences the port of the pump will register with the aperture last mentioned, and at the commencement of the up-stroke it will register in like manner with that of the reservoir.

Claim.—1. A series of air-pumps revolving around a common axis, and successively brought under an air-discharge port or ports at the upward stroke of the piston in each, substantially as set forth.

2. A revolving plate arranged between the discharging ends of a series of air-pumps and an air-receiver, in combination with a stratum of water or other suitable liquid, as a check-valve to the pumps, substantially as set forth.

137,124.—*Combined Garden Hoe and Roller.*—EDMOND BLANCHARD, Pocomoke City, Md.

The blade of the hoe is bifurcated at one end, and the other is entire. The divided part is in the form of an arch, and in the rear, at a distance of about the diameter of the arch, is attached a roller of an equal length. The handle is joined at the apex of the arch.

Claim.—A garden implement formed of the hoe A, curved and beveled or twisted plate B, shank or eye C, arms D, and roller E, constructed and arranged in connection with each other, substantially as herein shown and described, and for the purpose set forth.

137,125.—*Cupola and other Metallurgic Furnaces.*—OGDEN BOLTON, Jr., Pittsburg, Pa.

The openings, made by the connection of the pipe to the furnace, are stopped up and sand poured over the end of the pipe to complete the breast of the furnace. With this tapping-pipe the breast can be renewed daily, preventing the hardening or baking thereof.

Claim.—The tapping-pipe d, in combination with the breast b of the furnace, substantially as shown and described.

137,126.—*Clack-Valve for Wooden Pumps.*—AMOS BREED, La Harpe, Ill.

Claim.—The raised rim a of the valve-seat B in connection with the neck or under-band D driven into the end of tube A, substantially as shown, and for the purpose of securing a water-tight joint, and preventing the lodgment of substances under the clack-valve; and I disclaim all other parts.

137,127.—*Marbleized Composition Stone.*—THOMAS CARSON, Brooklyn, assignor to himself and THOMAS F. ATTIX, New York, N. Y.

Process of marbleizing composition stone, &c., by first preparing the surface with varnish to fill all pores, then immersing said surface (after providing it with any desired ground color, by brush or otherwise,) in a bath of water, whereon another color, which is to predominate, ground in oil and (chiefly) Dammar varnish, is floated and broken by rapidly stirring; and another veining color, mixed chiefly with oil, is also floated and broken; and lastly, removing the surface and drying the coating so applied, after which finishing-varnish is applied to render the colors clear and distinct. Or the marbleized finish may be transferred from paper (sized first, to prevent the colors running together,) to

the surface of the composition stone, &c. In this case the process above described is wholly reversed—the veining colors applied by means of the bath first, and the ground color applied last, so that the effect in either case is the same.

Claim.—The process of marbleizing mantles, tables, casings, and panels, made of stone or composition, substantially as above described.

137,128.—*Horseshoe.*—ISAAC DE MOTT, Cannonsville, N. Y.

Claim.—A calk fastened to the shoe by a screw and supported by a lip and doweled thereto, substantially as shown and described.

137,129.—*Combined Wrench and Grappling-Tool.*—SIMON B. DEXTER, Mason City, Iowa.

Can be used as a grappling tool, pinchers, or hand-vise.

Claim.—1. In combination with the jaw-levers A B and wedge-shaped slide F, arranged to operate substantially as described, the swivel and band H and J, ferrule K, handle L, and screw M, arranged substantially as and for the purposes set forth.

2. The spring N, in combination with the slide F, as and for the purposes described.

137,130.—*Grapple.*—SIMON B. DEXTER, Mason City, Iowa.

For raising or turning heavy stones or other bodies in building.

Claim.—1. A grappling-tool consisting of the adjustable levers B B having jaws A A, guide-bar E, and adjustable slides H H, arranged to operate substantially as and for the purposes described.

2. In combination with the inclined slide-bars H H and levers B B, the rollers J J, substantially as and for the purposes described.

137,131.—*Temporary Binder.*—DELOS DUNTON, Carpentersville, Ill.

The paper is laid face down and the bar carrying the adjustable pins inserted through the bottom of the box, when the presser forces the pins through the paper. The package thus formed is placed right side up in the box and the bar D placed underneath, with its spring-arms pressing the clamp-bars together.

Claim.—1. A file or paper-holder which has its sides provided with vertical ribs to prevent the papers from contact with the sides, substantially as specified.

2. A file or paper-holder which has its bottom constructed to receive and support a removable bar provided with pins for the reception of the papers, substantially as specified.

3. One or more pointed and screw-threaded pins, C C, in combination with a paper-file, when the said pins are adjustable and removable, and are arranged to pass through the papers and thereby retain them in the file, substantially as specified.

4. The removable bar B, provided with removable, adjustable, and pointed pins, and with fixed pins or posts, in combination with the removable bar D, provided either with perforations or depressions and with perforated flexible strips, substantially as and for the purposes specified.

5. A combined paper-holder, file, and binder, constructed and arranged to operate substantially as described, and for the purposes set forth.

137,132.—*Combustion-Chamber for Burning Hydrocarbon Vapor.*—CHARLES J. EAMES, New York, N. Y., assignor to MARY E. SMITHE, same place.

Claim.—Mixing-chamber, composed of a series of communicating chambers, or a single mixing-chamber divided by perforated walls, in combination with a surrounding air-chamber provided with means for the admission of combustible gases, substantially as specified.

137,133.—*Core for Casting Stench-Traps.*—MICHAEL GAFNEY, Newark, N. J.

The core is constructed in three parts and arranged for forming the exterior and interior shells.

Claim.—The combination of the core-pieces A, I, and K, and a suitable flask or mold, D, substantially as specified.

137,134.—*Locomotive Spark-Arrester.*—JOSEPH GIBBS, Opelousas, La.

The dust and cinders thrown by the currents of air against the hood fall into the water-tank just beneath.

Claim.—The hood C, composed of the semicircles E and F and conical cover D, on the smoke-stack of a locomotive-boiler, constructed and arranged substantially as shown and described.

137,135.—*Device for Sharpening Scissors.*—THOMAS HALVORSEN, New York, N. Y.

Arrangement of two files under a certain angle, so that by introducing one blade of a pair of scissors held in position by a strong spring, and sliding the same back and forth, the edge is sharpened rapidly and evenly by the files.

Claim.—The scissors-sharpener composed of frame C, spring D, files *b* and *b*, slot *d*, substantially as and for the purpose described.

137,136.—*Machine for Making Spool-Blanks.*—JOHN T. HAWKINS, Salisbury, Vt., assignor of one-half his right to GEO. R. HOLT, same place.

The stick from which the blanks are to be made is placed in a feeding-trough having a reciprocating and vibratory movement, which carries the blank forward to the turning-tool, then withdraws and moves it laterally against the cutting-off saw, which severs the turned blank from the stick.

Claim.—1. The combination of cams K and M with carrier, provided with arms for engaging therewith, the carrier-shaft B, spring R, and revolving cutter, substantially as specified.

2. The combination of guide I′ and rollers H′ with the pivoted vibrating carrier, substantially as specified.

3. The combination of spring H, pivoted lever F, and stop with the vibrating carrier D E, substantially as specified.

4. The combination of spring H and pivoted lever F with clamp G and carrier D E, as specified.

5. The carrier E, provided with a groove and teeth on the sides or edges thereof, as specified.

6. The combination of rest L′, spring K′, and stop-lever *p*′ with the carrier and cutter, as specified.

7. The combination of the brake X′ with the friction-gear W T and its operating mechanism, as and for the purpose described.

137,137.—*Incasing Caustic Alkali.*—GEORGE W. HUMPHREY, Pompey, assignor to himself and J. MUNROE TAYLOR, New York, N. Y.

Claim.—The mode or process herein described of putting up caustic alkali (soda or potash) for sale and use, and preserving it from the action of the atmosphere in air-tight India-rubber envelopes or coverings, substantially as described.

137,138.—*Wagon-Loader.*—JEREMIAH JOHNSON, Iowa City, Iowa.

Within a portable frame is suspended, by hoisting-gear, the platform upon which earth is scraped. When full the platform is elevated, the wagon drawn under it, and the load dumped.

Claim.—1. The loading apparatus, consisting of the portable frame, the elevating and dumping platform, and the apparatus for working said platform, arranged and adapted for loading the platform with a scraper, and for driving wagons, carts, &c., under it, and dumping the earth from it into them, substantially as specified.

2. The arrangement of the platform C, frame A, roller N, chains O, pulleys P, and driving-wheel, substantially as specified.

3. The arrangement, with the doors E and platform C, of the catch-bars F, bolts G, bell-cranks H, rods I, lever K, and handle L, substantially as specified.

4. The combination, with the doors E and a chain, S, connecting them in the manner described, of rod T on the floor of the frame, substantially as specified.

137,139.—*Molasses-Pitcher Top.*—GEORGE P. LANG, Jr., Allegheny City, Pa., assignor to LANG AND LAUSTER, same place.

A pitcher-top constructed with guide-pieces attached to the inside to form a delivery-spout, and the inclined flange or projection to conduct the drip back to the body of the pitcher.

Claim.—The guide-pieces *e e*, placed in a molasses-pitcher top, *a*, so as to form a delivery-spout, *f*, the bottom of which is formed by the inclined flange *h*, the whole being closed in or covered by the lid *c*, substantially as and for the purposes described.

137,140.—*Culinary Boiler.*—RICHARD B. LEWIS, Quincy, Ill.

A cylindrical heating-chamber, communicating with the furnace below, surrounds a cylindrical water-chamber. A boiler and this, in turn, envelops the central cylinder, where the food may be cooked. The amount of heat can be regulated by change of position of the exit-pipe.

Claim.—1. The combination of a food-cylinder, a heating-cylinder surrounding the food-cylinder, and a furnace for applying heat to the heating-cylinder, substantially as set forth.

2. The combination, with heating-cylinder, of the furnace, the breeching, one or more return flues, and a detachable chimney, substantially as set forth.

3. The combination of the heating-cylinder, the food-cylinder, and the connecting-pipe, substantially as set forth.

137,141.—*Sewing-Machine Caster.*—JESSE B. LINCOLN, Providence, R. I., assignor to himself and JAMES M. SAYLES, same place.

The caster of a sewing-machine table or similar article of furniture is locked in position by a peculiar form of brake attached to the swivel of the caster, and having a slight vertical movement, which brake is forced down upon the wheel of the caster by a bent cam-lever turning upon the connecting-rod, and having its lower arm in the shape of a wedge-hook to clasp around the spindle; the sets of casters being connected by rods in the usual manner.

Claim.—The combination of the caster A, brake B, lever C, wedges E E′, and rod D, with or without the adjustable hinge-clamps F F′, as and for the purpose specified.

137,142.—*Doughnut-Mold.*—GEORG MACHLET, Newark, N. J.

Two rims, each provided with a handle, support the two halves of the molds, which are formed of wire-gauze. The molds are connected together by guide-pins.

Claim.—The doughnut-mold, consisting of two half-molds, C, of wire-gauze placed within rims A, having pins *d e* and lug *f* and handles B, substantially as and for the purpose described.

137,143.—*Thill-Coupling.*—JOHN MARTIN, Henry City, Ill.

Claim.—The described means for coupling a draft-iron ball to an axle clip, consisting of open-bottomed lug F and bolt H passing through said lug and ball at right angles to thill, as set forth.

137,144.—*Stop-Cock.*—JOHN P. MERN, New York, N. Y.

On the breakage of the valve-stem the nut attached to the sliding gate can be disengaged therefrom by the removal of the keys.

Claim.—The keys *d*, in combination with the valve A and nut D, substantially as and for the purpose described.

137,145.—*Sizes for Separators.*—BYRON MILLER and MAJOR MILLER, Lowell, Wis.

Plain vertical longitudinal ribs, intersected by inclined transverse ribs, alternating with each other between the longitudinal ribs. Tops of both sets in same plane.

Claim.—A thrashing-machine sieve, having the inclined plates *b* short, the adjacent ones in different planes, and all with their tops in the same plane with the tops of the perpendicular plates *a*, as and for the purpose described.

137,146.—*Water-Wheel.*—JOHN NOLAN, Waddington, N. Y.

The upper portions of the buckets are vertical to the bottom of the chutes and sufficiently tangential to the axis of the wheel to beat right angles to the water columns flowing through the chutes, so that the greatest resistance will be offered to it. Below the chutes the buckets are joined to the outer conical rim, and are then turned backward by an abrupt curve, so that at the lower ends they become vertical and tangential to the inner rim, being in the form of the convex side of a spirally-curved plate on the upper side, by which the water is thrown mainly upon the outer rim after it passes from the place where it acts directly upon the buckets as it emerges from the chutes.

Claim.—The combination of the conical rims A and H, and the buckets F I J, all being constructed and arranged substantially as represented in the drawing.

137,147.—*Machine for Beading Sheet-Metal Vessels.*—CHARLES W. PRIEST, Troy, N. Y., assignor of one-half his right to J. WARREN LAMB, same place.

The lever that carries the knurl or beading tool is attached to a quadrant arm, which forms a guide or support for the lever and gives it a uniform movement.

Claim.—1. In a machine for beading sheet-metal vessels, a swing-lever guided by a quadrant, or its equivalent, in combination with a platform or slide rest, substantially as shown and described.

2. The shoe H, in combination with the elements of the preceding claim, substantially as shown and set forth.

3. The knurl N, constructed as described, in combination with the swing-lever J′ and quadrant-guide, as set forth.

4. The swing-lever J, knurl N, quadrant-guide K, and slide-rests, in combination with a lathe, for the purpose set forth.

137,148.—*Extension Table.*—ABRAHAM REED, Chicago, Ill., assignor of one-half his right to WILLIAM T. COOLEY, same place.

Each side of the table has three slides or extension bars, and the slides on the opposite sides are connected by four rollers, one roller being attached to the outside pair, another to the inside pair, and two rollers to the central pair of bars. This forms a pocket for the jointed extension leaves.

Claim.—The combination of the bars A A¹ A² and depressed rollers *a a′ b c* in an extension table, substantially as and for the purposes specified.

137,149.—*Can-Opener.*—JOHN J. REED, Lyons, Iowa.

A curved blade with convex cutting-edge has upon the back, near the point, a rectangular shoulder. The point pierces the tin to be cut, and the shoulder serves as a fulcrum when the blade is pressed into the tin.

Claim.—A can-opener, A B *b*′, constructed as described, with a curve or edge of blade, and a rectangular notch on back near the point, as and for the purpose described.

137,150.—*Saw-Setting Device.*—JOHAN B. SCHMID, Salem, Va.

Two handles, hinged at their end to U-shaped plates, are provided with narrow wedge-shaped projecting blades, the blade on one handle lying by the side of that on the other. Duplicate blades may be added, and their distance apart regulated by means of nuts placed between them. A thumb-screw in the handle regulates the set of the teeth, and an arched plate projecting from one handle through a slot in the other steadies the movement of the handles.

Claim.—1. The saw-set composed of the handles A B the inclined plates *f g* thereon, and curved or bent plates *a a* for upsetting two saw-teeth simultaneously in opposite directions, as set forth.

2. The additional plates *f′ g′* applied to the saw-set, having the plates *f g*, substantially as set forth.

3. The ears *l l* formed on the handles A B of a saw-set, and provided with the screw *m*, substantially as specified.

137,151.—*Washing-Machine.*—GEORGE SEYMOUR, Boone, Ia.

A bed of alternate fluted rolls and located fluted blocks on its lower rubber, and its upper or moving rubber with fluted cross-sections attached to ends so formed that it is supported by journals resting on a hoop-spring, which is held by a cross-bar on its upper side and serves to give it tension, when in use, by the aid of spiral springs connected with the lever, by which motion is imparted to the machine.

Claim.—1. The combination of the pairs of grooved rollers G and their metallic bearings H and the stationary grooved bars I with the grooved ends B of the tub, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the ring rods or wires Q with the cross-bar O, springs P, and oscillating rubber J K L, substantially as herein shown and described, and for the purpose set forth.

137,152.—*Hoisting-Machine.*—IRA SMITH, Tomhannock, N. Y.

A hoisting-machine, consisting of projecting arm, post, brace, wheels, and belts or ropes, with the crank-wheel, in combination.

Claim.—A hoisting-machine consisting of the parts A, B, and C, wheels F and J, and belts or ropes H and K, with the crank-wheel I, when the same are combined and arranged to operate as and for the purposes described.

137,153.—*Ash-Sifter.*—SAMUEL SMITH, Brooklyn, N. Y.

Claim.—A sieve, C, provided with projecting curved perforated band *h*, a vessel, A, having slot *d*, and a loose hand-lever, *e*, combined as and for the purpose described.

137,154.—*Breastpin-Tongue.*—LEWIS H. SONDREIM, New York, N. Y.

Claim.—As an article of manufacture, a breastpin-tongue consisting of the stem *a* and hinge-socket *b*, said stem being made of harder material than the socket, and provided with a threaded end that makes a corresponding thread in the socket, as and for the purpose described.

137,155.—*Liquid-Measuring Register.*—MORITZ SPRINGWATER, Evansville, Ind.

A float resting on the mash or liquid of a brewery or distillery, and connected by a chain and counterpoise with a sprocket-wheel which is in gear with a suitable registering mechanism, through a spring-ratchet clutch, serves, by every rise of level resulting from an addition to the liquid, to register and indicate the quantity thus added; while the amounts withdrawn from the vats or tubs permit the float to fall without affecting the register.

Claim.—A float, D, chain *i*, weight *j*, loose sprocket-wheel *a*, and spring-ratchet clutch *a d*, combined with the driving-shaft of an indicator mechanism that is turned only when the float D moves upwardly, as and for the purpose set forth.

137,156.—*Printing-Press Feeder.*—ROBERT J. STUART, Yonkers, N. Y.

The feed-table is pivoted and is lowered at the proper time to release the upper sheet from the clamps. A series of short, quick vibratory motions is imparted to the rubbing devices, which detach the sheet and deliver it to the carriers, which grasp and deliver it to the gripers.

Claim.—1. The combination, with the table B of the vibration rubbing-fingers L L and vibrating rollers N N, for separating sheets of paper upon the pile for delivery to a printing or other machine, constructed and operating substantially as described and specified.

2. The combination, with the separating mechanism described, of clamps b^1 b^1 and s^2 s^2, for holding the paper during the process of separating the sheets, substantially in the manner described and specified.

3. The combination, with the clamping and separating mechanism, as described, of a vibrating adjustable table to automatically present the sheets to the separating mechanism, constructed and operating substantially in the manner described.

4. The combination, with the separating and clamping mechanism, of the jaws P P^1 P^2 P^3 to seize and deliver the sheets to the gripers *a a*, substantially in the manner described.

5. The vibrating separating-fingers L L and vibrating rollers N N, operated by the undulating cam E, constructed and operated substantially in the manner described.

6. The combination, with the vibrating table, of the clamp-rod S, so constructed and arranged that the clamps s^2 shall always bear their proper relative position to the pile of paper.

7. The combination of the following elements, viz: A separating mechanism to separate the sheets of paper, a clamping mechanism to hold the paper during the separation of the sheets, and adjustable table for presenting the paper to the separating mechanism, and a delivering mechanism for delivering the sheets to a printing-press, all co-operating together substantially in the manner described and set forth.

137,157.—*Oil for Lubricating from Petroleum.*—JOHN K. TRUAX, Pittsburg, Pa.

A lubricating-oil from gum or wax and undistilled petroleum.

Claim.—A lubricating-oil composed of the herein before described residuary gum or wax and undistilled petroleum, substantially as described.

137,158.—*Fire-Proof Shutter.*—WASHINGTON M. VARS, Westerly, R. I.

The window-cap is made funnel-shaped, to catch and convey a portion of the water thrown on the face of the wall into hollow metallic shutter, which is provided with a discharge valve at the bottom. The recesses are for containing a lock and bolt, and to give access to the valve. A projecting flange surrounds the shutter to make a secure fire-proof joint, and it also affords attachment for the hinges.

Claim.—1. A hollow water-tight shutter, D, open at the top and having a controllable water-discharge at the bottom, as and for the purpose described.

2. The conducting-cap C, in combination with a tank-shutter, constructed substantially as shown and described.

3 A shutter, D, provided with the recesses K L and flange H as and for the purpose described.

137,159.—*Reversible Knob-Latch.*—RODOLPHUS L. WEBB, New Britain, Conn., assignor to THE RUSSELL & ERWIN MANUFACTURING COMPANY, same place.

The latch-hub is spheroidal in outline and mounted within the lock-case so as to be semi-rotated on its vertical axes, whereby the arms of the hub are disconnected from the horseshoe-plate and the latch-head projected so far beyond the face-plate of the case as to admit of its being reversed to adapt the same to a right or left hand door.

Claim.—A latch-hub having a spheroidal outline, mounted within the lock-case so that it may, as usual, be rocked or rotated in its bearings by and with the knob spindle, and also semi-rotated in its bearings independently of said spindle, in combination with a horseshoe-plate and swiveled latch-head, substantially as described, whereby the hub and horseshoe-plate may be temporarily disconnected, for the purposes specified.

137,160.—*Apparatus for Compressing Cotton, Hay, &c.*—FRANCIS WELDON, Kilmorony, Ireland.

A series of press-boxes placed on rails laid transversely upon the platform, to which short legs are attached, the upper ends of which connect with beams and the beams with the follower. The

whole is operated by means of ropes passing around pulleys and the windlass.

Claim.—1. One or more press-boxes, W, mounted upon wheels V, which are guided by rails, in combination with the vibrating shear-legs D, and the beams E, and ram F, substantially as and for the purposes explained.

2. The combination, with the swinging shear legs D D and the beams E, of the windlass G and H, and toe ropes and pulleys J K M N, arranged substantially as described.

137,161.—*Washing-Machine.*—BENJAMIN A. WILLIAMS, Berea, Ohio.

A clothes pounder or washer, constructed with an outside cylinder with chambers over it for springs, which are connected with the working-handle. Within it is the beater or pounder provided with chambers with apertures and valves, through which the water flows in its upward motion and is returned to the tub.

Claim.—The plunger C, partitions D, valves E, shell A, standards I, and springs K, constructed and arranged to operate in the manner substantially as described, and for the purpose specified.

137,162.—*Harvester.*—HIRAM M. YALE, Coldwater, Mich.

The pin which couples the pitman to the cutter-bar is retained in place by a hinged angular plate, which is secured to the inner end of the finger-bar by set-screws.

Claim.—The adjustable plates D, in combination with the hinged plate E, flange G, buttons h, and set-screws *m*, substantially as and for the purposes herein set forth.

137,163.—*Rotary Valve and Variable Cut-Off.*—ROBERT T. P. ALLEN, Farmdale, Ky.

A rotary valve having a chamber whereby the steam-pressure is equalized and the valve balanced, with a cut-off having a sector connecting with a governor for regulating the flow of steam to the engine.

Claim.—The hollow valve C, forming a steam-chest, in combination with the cut-off B provided with teeth *c*, the cogged sector *d*, and valve-seat A, all provided with the inlet and exhaust ports, as described, and operated substantially in the manner and for the purposes herein set forth.

137,164.—*Means for Propelling Boats.*—JOHN S. ANDERSON, Flintville, Wis.

Special combination of parts, whereby steam is applied to operate directly against the water as a motor for boats.

Claim.—The cylinders or boxes G, tubes D, valve-chest F^1, and valve F^2, tubes *g*, and valves E, in combination with the steam-boiler B and boat A, substantially as specified.

137,165.—*Safety Attachment to Hoisting-Machines.*—WILLIAM D. ANDREWS, Brookhaven, N. Y.

Claim.—1. The hook-shaped lips *c c* on or attached to the platform or cab in combination with the T-shaped guides attached throughout their whole length to the guide-posts A A.

2. The combination, with the stationary inclines H H on the platform or cab, the friction-rollers G G and the sliding blocks or wedges F F, and the levers E E, when the connection of the said sliding blocks or wedges with the levers is made by a free connection, substantially as herein described, whereby the sliding blocks or wedges are liberated only by the upward movement of the platform or cab.

3. The combination of the levers E E, the freely-attached sliding blocks or wedges F F, the stops *h h* on the platform or cab, fixed inclined surfaces H H, the rollers G G, the hook-shaped lips *c c*, and the T-shaped guides *b b*, the whole arranged and operating substantially as herein set forth.

137,166.—*Reversible Knob-Latch.*—WILLIAM H. ANDREWS, New Haven, Conn., assignor to MALLORY, WHEELER & COMPANY, same place.

Claim.—1. In a knob-latch in which the arms D are formed upon a yoke around the hub, and with a stud, F, to enter a recess in the rear of the hub, constructing the hub with its opposite sides parallel and the yoke of the arms corresponding thereto, so that by means of the said parallel sides the hub causes the movement of the arms, substantially as described.

2. In combination with the subject-matter of the first clause of claim, the bar G, connecting the arms D D forward of the hub, substantially as described.

3. In combination with the subject-matter of the first clause of claim, the spring *e* upon the stud F, substantially as and for the purposes described.

137,167.—*Reciprocating Steam-Engine.*—AUGUSTUS E. BAKER, Providence, R. I., assignor to HENRY W. GARDNER, same place.

Sliding valves, opened by tappets on shafts placed midway between the chests, are assisted in their closing movement by the excess of steam-pressure on their ends. A two-armed wiper on a rocker-shaft operates the exhaust-valves placed at the lower side of the cylinder. Clearance passages at each end of the cylinder allow the exhaust-valves to be manipulated. A tapering adjustable plug is arranged in the bottom of the air-cushion dash-pots.

Claim.—1. The arrangement of the detachable sliding valves F F, their valve-rods *a a*, and the valve-gear which operates the valves for their opening movements, substantially as herein described, whereby the excess of steam-pressure on the back ends of the valves may be made available to assist their closing movements, as herein set forth.

2. The combination of the two-arm wiper E on the rocker-shaft *k*, the two exhaust-valves *g g*, and their connecting-rod *m*, substantially as described.

3. The arrangement of the clearance-passages G G, the chamber H, the exhaust-valves *g g*, and the heads of the cylinder, substantially as described.

4. The tapering adjustable plug K, in combination with the piston J and air-cylinder L, substantially as described.

137,168.—*Feed-Cutter.*—WARREN S. BARTLE and JAMES GARLOCK, Newark, N. Y.

The bent lever, which carries the cutter-blade, is attached to a rock-shaft by an angular fitting and a bolt. The knife is adjusted to the throat by a cam-collar on the rock-shaft and a rib or lug. The length of cut is governed by a reversible gage-plate secured to the rock-shaft.

Claim.—1. The cam-collar G and the rock-shaft D, provided with rib *d*, in combination with the bent knife-lever E and the knife *b*, all constructed substantially as and for the purposes set forth.

2. The bent knife-lever E, with a projection, *c'*, at the end, having an angular recess, in combination with the rock-shaft D, having a corresponding projection, upon which the recessed end of the lever is secured by a bolt, all substantially as set forth.

3. The reversible and bent gage-plate H', constructed as shown, with a forked end, and secured to and adjustable upon the lever E by means of the washer *h* and bolt *i*, substantially as set forth.

137,169.—*Machine for Opening, Smoothing, and Guiding Fabrics.*—WILLIAM BIRCH, Manchester, England.

The fabric passes between the pairs of chains, which smooth it from center to selvage and thence under the central one of the corrugated bars. These bars are pivoted centrally and connected with the chain-carrying arm by means of elbow-levers, so that when the fabric deviates from a straight line the bars will turn and, through the levers, will move the chains and cause one pair to gripe the fabric harder than the other and draw it in its proper position.

Claim.—The combination of the two pairs of endless chains *q*, both pair running from the center outward, the two pairs of bars *w x*, the two two-armed levers *y z*, the plates *b'*, the jointed arms *c'*, and corrugated bar *d'*, all constructed and operating together substantially as described.

137,170.—*Machine for Shearing and Booking Tobacco.*—INGHAM W. BIBBING, Philadelphia, Pa., and JOHN S. M'CUNE, Camden, N. J., assignors to said BIBBING, JOSEPH O. CUTHBERT, Haddonfield, and LOUIS NORRIS, Camden, N. J.

The elastic portion of the rolls presses the leaf without injury to it, while the metallic portion flattens the stem.

Claim.—1. The combination of the yielding-rolls B B, having a middle portion, *a*, of metal, for rolling down the tobacco stems, substantially in the manner above described.

2. The combination of the shears J and J' with the rolls B B, for shearing off from the stems any remaining portions of the stalks, substantially as and for the purpose set forth.

137,171.—*Hydraulic Motor.*—BORACH ALBERT BLOCH, Paris, France.

The buckets of an overshot-wheel are suspended from pins or trunnions on the fellies of the wheel-caps. Inside of each cap is a circular plate, provided with slots in which slide pins, attached to the sides of the buckets, so that by a slight movement of the plates the angle of the buckets and the motion of the wheel are exactly reversed. The water falls on the wheel from either of two channels, each provided with two sets of cocks, thus enabling the operator to direct the water to either side of the wheel, as necessary.

Claim.—1. The combination, with an overshot-wheel, of a series of supply-pipes, each provided with a cock, and arranged, substantially as set forth, so as to regulate the quantity of water delivered to the wheel at different points.

2. The pipes or channels *c*, each provided with two series of cocks inclined in opposite directions, for the purpose specified.

3. The combination of a series of buckets, *a*, adapted to each other, as described, with a plate or plates, S, or equivalent device, for simultaneously reversing the whole series of buckets.

137,172.—*Saw-Filing Machine.*—GEORGE BLYTHE, Chillicothe, Mo.

The saw is clamped at the point of contact with the file. A curved bar, having grooves cut at certain distances apart, form guides for the file-frame. The center of the arc is located at the point where the line of travel of the file crosses the saw-clamp.

Claim.—1. The yokes C C carrying the wooden pegs P P, in combination with the set-screws D D and bars B B', substantially as shown and described.

2. In a saw-filing machine, the curved bearing-bar G provided with the grooves *g*, and having one end turned abruptly, and continues toward the center in nearly a radial line, terminating near the clamping-point, where its under side rests upon the bar B, as specified.

3. The guide H, having the tongue A and downward-projecting bolt A^2, in combination with the bar G, block F, and screw-shaft E, constructed, arranged, and operating substantially as shown and described.

137,173.—*Apparatus for Pitching Casks.*—FRIEDRICH BRENNER, Cincinnati, Ohio.

The machine is provided with three lines of rollers, arranged with one line at the top and one upon each side of the same, which last two lines are provided with screw-threads upon their peripheries in such a manner as to impart to the cask a lateral as well as rotary motion.

Claim.—A beer-cask pitching-machine, having revolving rollers C on which the cask rests, one or more of the rollers having a screw-thread or threads, *d*, the whole being arranged and operated substantially as and for the purpose specified.

137,174.—*Apparatus for Exhausting and Washing Gas.*—CHARLES H. BROWN and JOHN J. THOMAS, Philadelphia, Pa.

Low steam or water, or both, are introduced into the downward-extending portion of the discharge-pipe through suitable jet-tubes in such a manner that the jets will discharge in a downward direction.

Claim.—In combination with the vertical or downward-projecting portion of the discharge-pipe C the jet-tubes D, constructed and arranged to discharge steam or water, or both together, into the said discharge-pipe C, substantially as hereinbefore set forth and described, and for the purposes specified.

137,175.—*Portable Fountain and Lawn-Sprinkler.*—RUSSELL BRUSIE, New York, N. Y.

On the outer ends of the revolving arms are secured perforated caps, the perforations or orifices in which vary in number from two to five, and in their angles of inclination from ten degrees to sixty degrees. The arms are also perforated. The water issuing from the arms sprinkles a circle close to the base of the fountain, while that issuing from the perforated caps is thrown in concentric circles, one arm throwing beyond the other, according to the inclination of its perforations.

Claim.—In a revolving lawn-sprinkler, a series of discharge-orifices having an inclination varying with its different arms and of variable number, substantially as shown and described.

137,176.—*Thill-Coupling.*—WHEELER CABLE, Boston, Mass.

The spring is concave on both surfaces, and when compressed flattens the arch and forces the rubber more tightly against the shaft-iron.

Claim.—The rubber cushion or spring, formed with the concave *c* in addition to the recess *b*, substantially as and for the purpose set forth.

137,177.—*Washing-Machine.*—HENRY H. CASE, Berea, Ohio.

A wringer-roll is attached or connected to the upper side of the main cylinder by uprights with slots to allow upward play for the roll. A wash-board, on the under side of the cylinder, is arranged with two rolls and ribs. A corrugated roll is sustained by a coiled spring against the cylinder.

Claim.—1. The wash-board D with its ribs *d*, rollers d^2, and springs d^3, arranged substantially as shown and described.

2. The wringer G journaled in the ends of the bent and coiled elastic rods *g* and having a vertical play in the slots *s* upon the drum B, substantially as shown and described.

137,178.—*Spring Butt-Hinge.*—HENRY A. CLARK, Boston, Mass.

In the interior of the hinge-knuckles cams are arranged for raising and lowering the gate or door when it is operated. One cam is fixed upon the pintle part and the other slides up and down the inner surface of the knuckle, guided by V-shaped lugs running in V-shaped slots. An inserted coil spring forces down the sliding cam, and thus aids in closing a door or gate.

Claim.—The knuckle portion D of the leaf A of a hinge provided with a spiral cam-edge, *o*, in combination with the slide *f* having V-shaped projections *g* adapted to similar-shaped recesses in the knuckle portion, and with a spiral cam-edge, *n*, and a spring arranged beneath the slide, all arranged to operate substantially as described.

137,179.—*Treadle for Sewing-Machine.*—CHARLES F. CLOUGH and JESSE B. LINCOLN, Providence, R. I.; said CLOUGH assignor to WHIPPLE V. PHILLIPS, Greene, R. I.

Claim.—1. The combination of a rocker-plate with foot-plates, which are adjustable with relation to the fulcrum, as described, whereby the treadle may be operated with variety of movement, as and for the purposes specified.

2. The combination of a concave-faced rocker-plate with foot-plates, which have a convex bearing-surface fitted to the rocker-plate and adjustable thereon, substantially as described.

137,180.—*Kiln.*—RALPH CONNABLE, Jackson, Mich.

The floor of the kiln is made of bricks, each of which has a tapering cavity in one side. The bricks are set on edge so as to form draft-passages, which, having the largest opening below, cannot easily be clogged up.

Claim.—1. The brick F, having a tapering cavity in one side, substantially as specified.

2. A perforated floor of a down-draft kiln, built of bricks F, which are constructed and arranged substantially as specified.

137,181.—*Indicator-Lock.*—EDWARD A. COOPER, Lancaster, N. Y.

A lock in which a numbered wheel is connected with the mechanism of the lock so as to be moved one degree each time the lock is opened and indicate the number of times the lock has been opened, by exposing a different number or character through an opening in the lock-case. A vibrating arm is coupled to the locking-dog by a link in such manner that the dog may be moved by the hasp, in the act of closing, without affecting the vibrating arm, while the movement of the arm, by the action of the key upon its cam-face, will cause the dog to be withdrawn from the hasp and the numbered wheel to be moved one degree, thus indicating that the lock has been opened.

Claim.—1. In the combination with the hasp and locking-dog of a vibrating arm, coupled to the locking-dog by a link, in such manner that the dog may move independently of the arm, while the latter, when moved by the action of the key upon its cam-face, will necessarily withdraw the locking-dog, substantially as and for the purposes set forth.

2. The combination, with the locking-dog C and pivoted arm D, provided with spring-pawl *f*, of the indicator-wheel G, sliding detent-disk K, and key L, substantially as herein before set forth.

3. The combination, with the indicator-wheel G, provided with notch *e*, of spring-lever M, arranged on the plate A, for locking the indicator-wheel, substantially as hereinbefore set forth.

4. The combination, with the indicator-wheel G, locking-lever M, arm D, and detent-disk K, of a through-key, T, for disengaging the lever M and unlocking the lock, as hereinbefore set forth.

137,182.—*Measuring-Funnel.*—THOMAS E. CROPPER, Suffolk, Va.

A vertical plate within the funnel, extending from the handle side to the center, is graduated to indicate the varying measures of capacity at different levels, and also serves as the support for the thumb-lever, central valve stem, and valve.

Claim.—1. The plate C, extending from one side of the funnel inward to the center, and provided with graduating-marks extending across its face, substantially as shown and described, and for the purposes set forth.

2. The combination, with a funnel, of a graduated plate, C, valve D, rod *b*, lever E, spring *f*, and spring-hook G, all constructed and arranged substantially as and for the purposes herein set forth.

137,183.—*Machine for Skiving and Splitting Leather.*—PERLEY D. CUMMINGS, Portland, Me., assignor to THE SHOE-MACHINERY MANUFACTURING COMPANY OF CONNECTICUT.

A rotary disk-knife is supported upon a rotating spindle, and is adapted for either skiving or splitting leather. A pair of feed-rolls, mounted one above the other, and driven by suitable belting and gearing connections, feed the stock forward underneath the lower roll, the upper split portion returning between the rolls back upon the table, the lower portion passing under the knife.

Claim.—1. The combination of the horizontal disk-knife at the top of the rotary spindle, the table *b*, and the pivoted or tipping plate *k*, the plate having the edge-guide with its gage *n*, and the yielding bed-spring *x*, all substantially as shown and described.

2. In combination with the disk-knife mounted and rotating as described, the gage-bar *q*, bed-springs *x*, and feed or draw rolls *s t*, substantially as shown and described.

3. In combination with the disk-knife mounted and rotating as described, the rotating and reciprocating sharpening roll or cylinder, arranged and operating substantially as described.

137,184.—*Machine for Printing and Embossing Skirts.*—HENRY J. DAVIES, Brooklyn, N. Y., assignor to JAMES G. BANNETT and ANDREW H. SMITH, same place.

Conical printing, embossing, and impression rollers for printing and embossing articles of circular form. The feed-table is arc-shaped, and has a corresponding guide on its outer edge.

Claim.—The combination of one or more conical printing or embossing rollers, a conical impression-roller, an open-sided frame supporting the said rollers, and a feed-table having an arc-formed guide, the whole arranged and operating substantially as herein described, for the purpose set forth.

137,185.—*Fanning-Mill.*—LYMAN H. DECKER, Sauk Centre, Minn.

Frame made square, part thereof forming fan-drum. Delivery-spout hung on shaking-rod, and made reversible.

Claim.—1. In a fanning-mill, a square or rectangular drum, D, surrounding the fan, substantially as and for the purposes herein set forth.

2. The spout J hung upon a shaking-rod, *h*, and provided with a central longitudinal partition, *d*, substantially as and for the purposes herein set forth.

137,186.—*Combined Percussion and Time Fuse for Shells.*—ELLIS DRAKE, Stoughton, assignor to himself and JOHN S. SMITH, Leicester, Mass.

Special construction of fuse-stock and percussion plunger, adapted to each other, and having combined therewith a spring-stop and a time-fuse.

Claim.—A fuse-case provided with the grooves *a' a'*, in combination with the plunger F, having spurs or legs *c c* to receive percussion-caps, and provided with the retaining-spring *s* adapted to a groove or slot, *f*, in the fuse-case, all arranged to operate substantially as described.

137,187.—*Buffing-Mandrel.*—GEORGE B. DUNHAM, Lynn, Mass., assignor to JOHN G. BUZZELL & CO., same place.

A wooden roller having an abrasive covering is divided longitudinally and centrally. The mandrel is provided with screw-threads and nuts having concave faces, which correspond with the conical ends of the wooden roller and hold the sections together.

Claim.—1. In combination with the shaft A, the buffer-roller B divided longitudinally and centrally, and its sections connected together at one side by means of the elastic hinge C, substantially as and for the purpose specified.

2. In combination with the divided roller B and felt covering E, the metal flanges D attached to said roller, and provided with the perforations *d*, substantially as and for the purpose set forth.

3. In combination with the divided roller B provided with conical ends, the nuts F made concave upon their inner faces and fitted upon the threaded portions *a* of the shaft A, substantially as and for purpose shown.

4. The shaft A provided with the threaded portions *a*, the divided roller B having conical ends and covered with felt E and abrasive material G, and the nuts F having conical inner faces, when said parts are constructed and combined substantially as and for the purpose specified.

137,188.—*Loom Take-Up Mechanism.*—SAMUEL ESTES, Newburyport, Mass.

To allow the cloth-roller to rotate back a short distance when the weft breaks. The shaft of the stop-motion carries a detent-pawl, between which and the impelling-pawl is arranged a slotted stop-pawl working on a stud upon the frame. A link connects the detent and actuating pawls, so that the stop-motion shaft, when operated, raises both from the ratchet-wheel, which is thereby released and allowed to move back a distance corresponding with the length of the slot in the stop-pawl. The three pawls are also so arranged that with one hand the workman can easily disconnect them all from the ratchet-wheel.

Claim.—The slotted stop-pawl G, lifter O, and draw-pawl C, constructed as set forth, and arranged as described, with the main pawl F and with the ratchet B arranged with the cloth-roller H and connected therewith by gears, all as specified.

137,189.—*Automatic Fan.*—WILLIAM FAY, New Orleans, La.

The fan-stock and its counter-weight are both made adjustable upon the rock-shaft.

Claim.—The operating mechanism herein described, which is substantially that of the clock, in combination with a rock-shaft having a series of perforations, *m m*, fan M′, and balance-weight O, the whole being constructed and arranged to permit of the fan and weight being adjusted on the rock-shaft, as described, and for the purpose specified.

137,190.—*Combined Sail and Marine Drag.*—THOMAS M. FLEETWOOD, Savannah, Ga.

A boat's sail has secured to its head or upper edge a light bar of metal, which acts as a yard. When used as a drag, the mast is unshipped, lashed to the foot of the sail, and a line attached. A bag is formed by tuck-ropes at the head of the sail, and the weight of the metal keeps it just below the surface of the water.

Claim.—The combination of the spar A, constructed to form a mast, the sheet or sail B, the metal bar C, and the tuck-ropes *d d*, substantially as and for the purpose herein set forth.

137,191.—*Bedstead.*—FREDERIC G. FORD, Bridgeton, N. J.

Auxiliary hinged or pivoted legs are attached to the side rails to sustain them when detached at the ends, and connecting-rods bind the two side rails together.

Claim.—The combination of the hinged or pivoted legs D D on the rails C C, and one or more connecting-rods, G, substantially as and for the purposes herein set forth.

137,192.—*Machine for Rounding and Backing Books.*—ROBERT F. FOSTER, THOMAS S. BAYLIE, and JAMES HARBIN, Washington, D. C.

The book is placed upon the feed-table, which, moving forward, carries the back of the book between two forming-rollers, while the mandrel concaves the face. The book then passes to the pressing-rollers, and finally between clamps forward to the backing-roller.

Claim.—1. The rounding-rollers E, operating substantially as herein described, in combination with a form or mandrel and a supporting table or holder, for the purpose specified.

2. The combination of changeable rollers and forms or mandrels for rounding books of different thicknesses.

3. The rounding form or mandrel D erected on the feeding-table B to operate in connection therewith to introduce the books between the pressing-rollers, substantially as set forth.

4. The pressing-rollers F, in combination with the rounding-rollers E, for receiving the rounded books so as to preserve their form, and for expressing the air so as to solidify the books, as set forth.

5. The clamp G G^2, arranged and operated substantially as described, in combination with the pressing-rollers F and backing-roller J, for holding the rounded books during the backing operation.

6. The stop-gage H, arranged and operating substantially as described, for the purpose specified.

7. The combination of a feeding-table, B, a rounding form or mandrel, D, rounding-rollers E, pressing-rollers F, a clamp, G G^2, and a backing-roller, I, arranged and operating substantially as herein described, for rounding and backing books by automatic machinery at one continuous operation, as set forth.

137,193.—*Process and Implement for Expelling Air from the Composition from which Artificial Stone is Molded.*—GEORGE A. FREAR, Chicago, Ill., assignor of one half his right to CHARLES HOLLAND, same place.

Claim.—1. The process herein described of expelling the air from the plastic mass from which artificial stone is molded, by perforating the mass in the mold with numerous small holes, and jolting or striking the mold or tamping the mass, substantially as described.

2. The instruments represented in Figs. 1, 2, and 3, substantially as and for the purpose described.

137,194.—*Kiln for Drying Malt, &c.*—JOSEPH GROMEN, New York, N. Y.

Improvement on his patent of September 17, 1867. The floors are made of independent perforated and flanged sections, having spaces at their edges for passage of air. Each section is supported by a rock-shaft provided with crank, &c., to secure an oscillating motion by means of a tappet-shaft. With the floor slides are combined with spring-bolts, adjusted automatically by cams on the tappet-shaft, to lock the alternate floors while the others are tilted. The charging-truck depends a little into the top of the kiln, and its bottom has partitions with tilting floors to correspond with the sections of the drying-floor.

Claim.—1. The perforated and flanged sections a^1 of the floor B, each mounted upon its own shaft b^1, for operation in connection with the tappet-shaft *p*, as herein shown and described.

2. The floor-tilting slides *j j′* and bolts *m m′*, in combination with the tappet-shaft *p* and with the sectional floors B, so that the sections of the floors are turned in succession and then returned to their horizontal position, substantially as described.

3. The truck C supported by rails on the kiln A, and divided into a series of partitions, *e e*, and depending within the kiln, as described, for operation in connection with the sectional and tilting floors *a a*, substantially as herein shown, for the purpose specified.

4. The arrangement of air-channels formed between the floor-sections *a* by means of flanges a^2 b^2, or their equivalents, substantially as and for the purpose set forth.

137,195.—*Dispensing Apparatus for Soda-Water.*—WILLIAM GEE, New York, N. Y.

A swinging arm furnished with a cock, whereby the soda-water may be delivered from the apparatus in proximity to the sirup with which it is to be flavored. Also, in combination with the draft-arm, of a series of sirup vessels or cocks arranged in an arc of a circle concentric with the point from which said arm swings, whereby the arm may be shifted to bring its outlet-orifice in a position adjacent to the sirup-outlet, so that both the soda-water and its flavoring-sirup may be delivered into the tumbler at the same time. A tumbler carrier or guide is combined with the draft-arm.

Claim.—1. The swinging draft-arm for soda-water apparatus, substantially as specified.

2. The circularly-arranged series of sirup cocks or vessels, in combination with the draft-arm, substantially as and for the purpose herein set forth.

3. The tumbler guide or carrier *h i*, in combination with the draft-arm, essentially as and for the purpose specified.

137,196.—*Self-Tamping Torpedo.*—MONTROSE GOTHAM, Oil City, Pa.

Claim.—1. The combination of the blocks *g g* with conical winged wedges *c* and rods *i*, arranged parallel with the sides of the wedge, so that the raising of the blocks contracts the diameter of the ping, substantially as shown and described.

2. The side wedges *c c*, when arranged on opposite sides of cone *c* so as to maintain an even pressure upon blocks *g g* upon the explosion of the torpedo, substantially as shown and described.

3. The combination of the cord *o* with the subject-matter of the foregoing claims, whereby the torpedo *b* and wedges *c* are suspended, substantially as shown and described.

137,197.—*Carriage-Spring.*—CHARLES S. S. GRIFFING, Salem, Ohio.

In combination with an elliptic spring, two or more guide-rods are arranged parallel to one another in vertical positions, and surrounded by rubber cylinders, that the lateral or vertical displacement of the spring will be prevented.

Claim.—An elliptic carriage-spring, A, in combination with the vertical guide-rods, two or more, B B′, elongated bearings D D′, and rubber springs E, substantially as and for the purpose specified.

137,198.—*Torpedo for Oil-Wells.*—ALEXANDER HAMAR, Philadelphia, Pa.

The plunger fires the charge and the bullet ruptures the casing, causing the two explosive substances to mingle and detonate with great violence.

Claim.—1. In a torpedo, the combination of separate charge-chambers, containing substances explosive only when commingled, and a cartridge-chamber, the projectile from which, when fired, ruptures the walls of the charge-chambers, commingles the substances therein contained and produces an explosion, substantially as set forth.

2. The combination, in a torpedo, of a cartridge carrying a projectile, a separate charge-chamber, and a compressed air-chamber to supply oxygen to the explosive substances, substantially as set forth.

137,199.—*Sewing-Machine for Quilting.*—JOHN HAPPE and WENZESLAUS NEWMAN, New York, N. Y.

A straight-line needle-bar is combined with a double needle-bar adapted to sew in zigzag and curved lines. The ends of the shaft carrying the cam-disks, which give the rising and falling movement to the double needle-bar, are arranged to slide in tubes to allow of a lengthwise reciprocation corresponding with a similar movement of the double needle-bar, and by means of these tubes and suitable crank connections the shaft above referred to actuates the shaft carrying the cam-disks, which reciprocate the straight-line needle-bar vertically. By means of a stair-shaped tappet, to regulate the movement of the feed-motion pawl, the needles are moved in curved lines.

Claim.—1. The tubes *t* and cranks *v* s^0, connected by rods *w*, in combination with the shaft E, which imparts motion to the traversing needle-bars F F′, and with the shaft M, which imparts motion to the rising and falling needle-bar O, substantially as set forth.

2. The combination of a curved or stair-shaped tappet, f^0, with the feed-pawl f^0, and with the traversing needle-bars F F′, substantially as and for the purpose shown and described.

137,200.—*Vapor-Engine.*—JOHN F. HASKINS, Fitchburg, Mass.

The cylinder is provided with a double-headed piston, one head working in one part of the cylinder and the other head in the other part of the cylinder, the two heads being of different diameters and the two parts of the cylinder of correspondingly different diameters for the respective vapors—vapor of water and a vapor evolved from a highly volatile liquid. The two parts of

the cylinder are separated by an annular recess, which receives the liquid condensed from the upper part of the cylinder and prevents such liquid from cooling the piston head of the lower part of the cylinder, it being drawn off by any suitable device.

Claim.—The cylinder made with the two piston-spaces *a b*, having between them the condense recess *d*, substantially as shown and described.

137,201.—*Sad-Iron.*—JOHN HEWITT, Pittsburg, Pa.

A reversible sad-iron, with one face polished in ordinary form, having an opposite face inclined or tapering, extending in an angular direction and form from the center to its point.

Claim.—The reversible plate A having one face, D, flat and finished as a sad iron, and the other face, D′, tapering from a point at or near its center so as to leave a polishing ridge, *d*, extending entirely across the plate and about midway thereof, substantially as described, as and for the purpose specified.

137,202.—*Carriage-Jack.*—DAVID HIESTAND, Pughtown, Pa.

Improvement in carriage-jacks, consisting in a spring-catch attached to the stock, which holds the lever in position and renders it stationary while the wheel is being removed.

Claim.—The spring-catch D, in combination with stock A and lever C, substantially as shown and described.

137,203.—*Combined Register and Stove-Pipe Thimble.*—CARLTON HILTON, Lockport, N. Y.

The register is provided with two operating-rods, one being for use in the room above and other for use in the room below the thimble.

Claim.—As a new article of manufacture, the combined stove-pipe thimble and register shown, consisting of the cylinders A and B, the heads C and D, the sliding plate E and the operating-rods G and H, substantially as and for the purpose specified.

137,204.—*Casting Bottoms on Sheet-Metal Vessels.*—ROBERT J. HOWDON, Cincinnati, Ohio.

The patterns are constructed to facilitate the removal of the sand from the surface upon which the bottom is to be cast.

Claim.—1. A pattern for molding and casting bottoms on sheet-metal vessels, consisting of the disk D, flanged rim *d e*, and ring *f*, arranged and acting substantially as and for the purpose specified.

2. In combination with the elements of the first clause, the ear F and supplementary strips *i i′*, substantially as and for the purpose described.

137,205.—*Sad-Iron.*—WILLIAM L. HUBBELL, Brooklyn, N. Y.

The iron has two smoothing faces, set at an angle to each other. At each end are inlets for gas and air. A wire helix, placed between the upper and lower shell of the device, allows the currents of air and gas to pass upward, but retains the flame.

Claim.—1. Two sad irons of different shapes or sizes, united together at an angle to each other and provided with a handle, as and for the purposes set forth.

2. The double sad-iron, formed of the hollow shells *a b*, with air and gas inlets at both ends, and constructed substantially as specified, so that the flame burns beneath the inclined shell, as set forth.

3. The double hollow sad-iron separated into a mixing-chamber and a flame-chamber by a division within the hollow shells that allows the air and gas to pass through, but retains the flame above such division, as set forth.

137,206.—*Washing-Machine.*—FLETCHER HULET, Berea, Ohio.

A washing-machine constructed with a center plain cylinder, around which is appended a spring, at the lower end of which is attached a roll. On its upper end a roll of similar form, and a rubber or wash board corrugated back of it, closely connected with the cylinder by the operation of the spring, and motion communicated by an ordinary crank to the center shaft of the cylinder.

Claim.—The springs C C, rollers E F, and wash-board G, as arranged to co-operate in combination with the cylinder B, provided with a bar, H, and box or tub A, in the manner substantially as and for the purpose specified.

137,207.—*Middlings-Purifier.*—ANDREW HUATER and CHARLES E. WHITMORE, Quincy, Ill.

Wire-cloth and bolting-cloth on sieve, former imparting vibration to latter; sieve suspended and reciprocated so as have an up-and-down and to-and-fro movement; vibrating trough feeding over its side to the screen in an even sheet across whole width; two fans, adjustable so that point of meeting and deflection upward of the blasts can be regulated.

Claim.—1. A bolt or screen, B, composed of wire and bolting cloth, arranged one above the other, substantially as and for the purpose set forth.

2. The combination, with the bolt or screen B of a middlings-purifier, of the cams D, vibrating levers E, and springs O, for imparting a vibratory and percussion movement to said bolt or screen, as described.

3. The combination, with the bolt or screen B, of the inclined suspending-links C, and the mechanism for vibrating the bolt, substantially as described, whereby a rising-and-falling as well as a reciprocating or vibratory movement is imparted to said bolt, as described.

4. A vibrating feed-trough, K, or the equivalent therof, for receiving, leveling, and spreading the middlings or other materials discharged therefrom, substantially as described.

5. The combination of the feed-trough with the bolt or screen B for spreading the middlings evenly across the receiving end of the bolt or screen, substantially as described.

6. The combination, with the bolt or screen B, of the two fans for producing counter currents of air, substantially as and for the purposes set forth.

137,208.—*Duplex Railroad Ticket.*—THOMAS A. JERR, Buffalo, N. Y.

Claim.—A folded duplex ticket, each member or half of which is provided with a corresponding and coincident series of amounts, names of months, and figures representing the days of the month, and adapted to be punched, as described, and having also a blank space for the terminal station, the initial station being printed or written, as hereinbefore set forth.

137,209.—*Book of Railroad-Fare Tickets.*—THOMAS A. JERR and LOUIS BRUSH, Buffalo, N. Y., assignors to THE AMERICAN DUPLEX-TICKET COMPANY, same place.

Claim.—1. In books of duplex railroad tickets, a cover having delineated upon it the book number and a system of dates, whereby a punch mark or marks will indicate the time of delivery or both the delivery and return, and the detached cover thus punched operates as a record of the transactions, as between the agent and conductor, substantially as hereinbefore set forth.

2. In such a book, the two covers carrying the data above set set forth, whereby one punched and detached cover operates as a receipt therefor, and the other attached cover as a credit for its return, substantially as hereinbefore set forth.

137,210.—*Table-Leaf Support.*—ANDREW C. JOHNSON, Rockford, Ill.

The supporting-bracket is made in two pieces for convenience in connecting with the supporting-arm. The outside piece of the bracket is provided with an arm extending below the supporting-arm, having at its end a pin, around which is secured a spiral spring, the other end of the spiral spring being secured to the lower side of the supporting-arm. To the table-rail is fastened a metallic plate, having a flange located so as to receive the lower end of the supporting-arm.

Claim.—The bracket C provided with the arm C′, in combination with the pivoted arm or latch D and spiral spring E, arranged and operating substantially as described.

137,211.—*Door-Bolt.*—JOHN JONES, New York, N. Y.

The bolt-plate is provided with a slot enlarged at both ends, and the stem of the knob or thumb-piece which passes through the slot is flattened so that, by a partial rotation of the knob, the bolt may be locked when drawn in or when thrown out.

Claim.—The slot in the plate E, enlarged at both ends, and the rotary flattened stem D, in combination with the bolt B, spring C, and slotted tube A, substantially as herein shown and described.

137,212.—*Horse Hay-Rake.*—JOHN F. KELLER, Hagerstown, Md.

The rake-head is the front side of a frame, which is pivoted to arms in rear of the main axle.

Claim.—1. The rake-head D, in combination with the arms *d* d^2, lift-bar D′, and bars C C, substantially as and for the purpose specified.

2. The combination of the rake-head D with transverse grooves for the teeth and keepers F F and teeth G G curved or affixed thereto, substantially as and for the purpose set forth.

137,213.—*Mucilage.*—ADRIAN KLOCZEWSKI and DEMETRY MIKELEFF, Washington, D. C.

A compound for causing paper, leather, wood, &c., to adhere to the surfaces of their or similar substances.

Claim.—1. The improved mucilage, consisting of gluten with acetic and tannic acids, substantially as described.

2. The combination of gluten with acetic, tannic, and sulphuric acids and chloride of calcium, in the manner described.

3. The combination of gluten with acetic, tannic, sulphuric, and carbolic acids and chloride of calcium, in the manner described.

137,214.—*Bed-Urinal for Medical Purposes.*—JONATHAN R. KNIGHT and JOSEPH P. COBURN, Greenfield, Mass.

The vessel is constructed in the form of a hollow cone, and inclosed at its upper end by a cover permanently attached, and at the center an opening within which is secured a metallic pipe extending downward into the vessel. The small end of the vessel is open, and communicates, through a flexible pipe, to a suitable receiver, so that the vessel may be placed within the bed in a convenient position to enable it to receive the contents without the patient sitting up.

Claim.—1. The reservoir A, provided with the cover B, the opening C, and the pipes D and *d*, and connected with a suitable vessel by means of a flexible pipe, E, substantially as and for the purpose specified.

2. In combination with the reservoir A, constructed as described, the pipe H provided with the flaring mouth *h* and lip *h′*, substantially as and for the purpose shown.

137,215.—*Governor for Gas-Exhausters, &c.*—RICHARD KOCH, New York, N. Y.

A bellows-valve in a case is connected at its lower end with a pipe, through which the gas, &c., enters, and is provided at its upper end with a spring-fork. This fork engages with a lever that connects to the throttle-valve of the engine and regulates it. Combined therewith is an alarm which is operated by a projecting pin that strikes against the edge of the case.

Claim.—1. The rod F, constructed with two spring-jaws, *b b*, the shanks of which are curved at their lower ends, in combination with a bellows-valve, A, a hood or cross-bar, E, and with the

throttle-lever G, the whole constructed and operating substantially in the manner set forth.

2. The rod F provided with the pin *f* and the bellows-valve A, in combination with a suitable alarm, substantially as and for the purpose described.

137,216.—*Dummy-Engine.*—MATTHEW H. KOLLOCK, Philadelphia, Pa.

The boxes of the car-wheel axle move in curved bearings concentric with the pinion, so that the axle of the latter shall at all times be equally distant from the car-axle.

Claim.—1. The arrangement of the pinion D either above or below the horizontal line of the car-axle, but parallel therewith, to allow the spring to be independent of the axle, and still keep the pinion in gear.

2. The combination of the pinion D, arranged as described, and the concentric bearings of the car-wheel axle.

137,217.—*Soldering Apparatus.*—CHARLES B. KOONS, Philadelphia, Pa.

A soldering iron and heater combined with a reservoir or reservoirs for containing solder and resin.

Claim.—1. A soldering-iron and a heater for the same combined in one instrument, substantially in the manner described.

2. The combination of the said soldering-iron and heater with a reservoir for containing solder, or reservoirs for both solder and resin, or other flux.

137,218.—*Washing-Machine.*—JULIUS H. KRUSE, New Melle, Mo.

A washing-machine constructed in form of a cylinder working within a boiler upon journals, with its inner surface or diameter covered with cylindrical ribs, open in opposite directions, that the water may be distributed upon the clothing at any angle, and its opening or cover held in position by a spring-bolt.

Claim.—The combination and arrangement, in the rotary cylinder of a washing-machine, of the open ribs F F', having mouths presented alternately in different directions, the door G, and spring-bolts I, substantially as and for the purposes set forth.

137,219.—*Musical Instrument.*—WILLIAM LEIGH, Bridgeport, Conn.

Claim.—In a musical instrument having a key-board, substantially as set forth, a wooden case having a mirror or glass plate, E, inserted immediately over the keys, with or without the key-slip D of glass mirror or colored glass, substantially as and for the purpose set forth.

137,220.—*Apparatus for Shearing Animals.*—CHARLES AUGUSTE JOSEPH LENOBLEE, Paris, France.

Upon a toothed plate provided with a fixed handle, a movable handle is pivoted, upon the extension of which the rear ends of the blades rest, their points being pressed upon the teeth of the fixed plate by a forked lever pivoted by a universal joint to the extended handle near the blade-seats, and adjusted by a screw at the rear end.

Claim.—In combination with the toothed sector, provided with its fixed handle, the pivoted handle, upon which is arranged the blade carrier or carriers *a*, having seats for the rear end of the blades, the adjusting lever or levers *f*, and the set-screw *h*, whereby the pressure of the movable blades may be adjusted, substantially as set forth.

137,221.—*Cultivator.*—MYRON LEWELLIN, Bergen, N. Y.

A jointed head armed with teeth for the purpose of raking through the rows of corn, and thus freeing them from weeds and dirt; arranged for attachment to a common cultivator.

Claim.—The cross-beam C, with jointed heads C' C', the bearings D D, stirrups *d d*, brace-bars E E', and loop *g*, when combined and arranged with an ordinary cultivator, in the manner and for the purpose specified.

137,222.—*Apparatus for Producing Bromine from Bitterns, &c.*—GOTTLIEB LEYER and JOHN A. WINTER, Pomeroy, Ohio.

A rectangular retort incased within a wooden box for distilling bromine from bittern.

Claim.—1. The retort D, provided with the small tube I and the sheathed orifice R S, in combination with the revolving stirrer N O, operated by the pitman P, substantially as and for the purposes hereinbefore set forth.

2. In combination, the box A, having orifices B C, the retort D provided with pipes I J M, funnel K, tube I, and sheathed orifice R S, and the revolving stirrer N O, arranged relatively one to the other as as and for the purposes hereinbefore set forth.

137,223.—*Lantern.*—ADAM LOEFFELHOLZ and ANTON PRIER, Milwaukee, Wis.

A narrow vertical wall forms with the lamp a chamber adapted to receive the chimney-holder, which has an overhanging portion to which the braces are secured. The lamp, the holder, and its overhanging portion are locked by pins running in slots and secured by springs. The upper cap is adjustable to the length of chimney by screw-threads and screws.

Claim.—1. In combination with the rim C having the openings *c c*, and supplied with the spring-catch c^1 and fenders C' C'', the chimney-support B *b* with an overhanging flange, substantially as shown, and for the purpose described.

2. The lamp A *a*, chimney-support B *b b*, rim C *c c* with spring-catch c^1 c^2, fenders C' C'', cover D *d*, chimney-balance D' d^1, and a chimney, all combined substantially as and for the purpose specified.

137,224.—*Feed and Delivery Apron.*—PRESTON R. MANSFIELD, Lancaster, Mass.

An apron made of rubber cloth and having ribs or projections formed as integral parts thereof and during the process of manufacture, as explained by the claim. A substitute for the ordinary slatted apron.

Claim.—An elastic feed or delivery apron made of a strip, *a*, rib-forming fillings *b*, and covering-strip *c*, the edges of strip *a* lapping the edges of strip *c*, and the whole being vulcanized together, substantially as shown and described.

137,225.—*Car-Coupling.*—HENRY E. MARCHAND, Pittsburg, Pa.

Claim.—1. The trigger-arm H, provided with shoulders and a tenon, K, as described, and having its bearing within the seat I for operation in connection with the coupling-pin B and a link, substantially as described.

2. The notched coupling-pin B provided with an enlarged shouldered end, G, and with lateral ribs D to operate in respect to ways or grooves in a draw-head, in combination with a pivoted ring, O, substantially as and for the purpose herein described.

137,226.—*Metal-Lined Copper and Other Vessels.*—JOHN MATTHEWS, New York, N. Y.

A sheet of copper or other tough metal is coated with tin or other non-corrodible metal, and by means of dies and pressure forms into two seamless halves, which are then united by the process of "sweating;" or the coating may be applied after forming the parts.

Claim.—A metal-lined fountain or reservoir of copper or other tough metal, constructed of two seamless halves formed by pressure or other equivalent process, as set forth.

137,227.—*Eccentric Rod for Steam-Engines.*—JOHN F. MCCUTCHEN, Philadelphia, Pa.

A block is inserted around the eccentric pin to obviate the undue wearing of the ends of eccentric rods. To prevent the block from turning beyond a given distance on the pin a small pin is inserted into a segmental recess in the fixed collar.

Claim.—1. A block, B, adapted to and entirely surrounding the pin D of a valve-lever, and fitted to the end of an eccentric-rod, all substantially as set forth.

2. The combination of the pin *e* of the block B with the segmental recess *f* of the collar *a*, substantially as and for the purpose described.

137,228.—*Bran-Duster.*—JOHN T. MCNALLY, Brooklyn, N. Y.

Alternate strips of card-clothing or fine teeth and wire-cloth are arranged inside of a case upon which revolving brushes act to separate the bran from the flour.

Claim.—The bran-duster, made with a case having alternate sections or strips of card-clothing or fine teeth and wire-cloth, substantially as and for the purpose set forth.

137,229.—*Reversing-Valve for Steam-Engines.*—PETER W. MILLER, St. Louis, Missouri.

An oscillating valve is arranged between the slide-valve and the steam-cylinder, and is provided with twin-ports that register with double ports in the cylinder and slide-valve seat. To reverse the engine the oscillating valve is turned to register with the opposite ports.

Claim.—1. The reversing-valve I having steam-passages L L' and M M', substantially as and for the purpose set forth.

2. In combination with the valve I, constructed as described, the case H having ports G G' N N' O O', and forming upon one side the seat of the slide-valve E.

3. The combination of the reversing-valve I and case H, constructed as specified, with the slide-valve E and a steam-engine cylinder, substantially as and for the purposes set forth.

137,230.—*Dinner-Pail.*—PETER MOLAN, New York, N. Y.

The inner vessel is provided with a perforated extension to the bottom, suitable legs or supports, and with bracing-arms at the top thereof.

Claim.—The inner casing or receptacle D, provided with the perforated extension F, the legs E, and arms G, in combination with the outer casing A, as described.

137,231.—*Package-Register.*—GEORGE W. MOORE, Philadelphia, Pa.

Sets of checks are strung upon pins, which are set in the bottom of a drawer with their ends projecting into a groove in the top of the case. They are transferred from pin to pin to indicate the delivery of the articles they represent.

Claim.—The box A provided with a sliding drawer, B, carrying pins or fingers C, in combination with the longitudinal grooves D, when constructed and operating as herein set forth.

137,232.—*Tucker for Sewing-Machines.*—JOSEPH S. OAKLEY, Passaic, N. J.

The folder pivoted to folder-bar and confined in working position by means of the adjustable stop has its forward edge inclined with relation to the surface of the table and the line of feeding movement, and the edge of the folder toward the needle is made gradually thinner, thus positively and sharply creasing the goods just as it is to be sewn, and extending the tuck horizontally and evenly. The guide bears against the seam of the last tuck, and, by adjusting the roller as to its inclination, the fabric may be drawn more or less firmly over the folder.

Claim.—1. The combination of the folder-bar D, the adjustable folder E, the adjustable stop K, the sliding guide H, and the inclined table I, for arrangement in relation with the needle and presser-foot, substantially as specified.

2. The folder E and guide H, when said folder is of tapering thickness at its forward edge *f*, and inclined forwardly at its thinner edge, in combination with the adjustable inclined table I, all arranged essentially as described.

3. The combination of the movable or swinging spring-arm N with the obliquely-arranged stretching-roller M, substantially as specified.

137,233.—*Umbrella-Handles.*—ABRAHAM OBERNDORF, Jr., Baltimore, Md.

The handle has fitted to it a ring with a projecting plate or hook, by which to suspend the umbrella to some part of the dress. A rotary ring on the handle having a slot, engages the end of the hook-plate when not in use.

Claim.—1. The ring B provided with the projecting plate C, and both applied to the portion A of an umbrella or parasol handle, as and for the purpose described.

2. The loose rotary ring D having open slot *d*, and applied to a recess in the portion A of an umbrella or parasol handle, to hold the plate C at the time, in the manner and for the purpose set forth.

137,234.—*Washing-Machine.*—ABIEL O'DELL, BUCYRUS, Ohio.

A washing-machine with an adjustable slide to adjust it to the size of tub, connected by a link attached to a spring on the outside of it—that is, the tub.

Claim.—The combination of the adjustable slides *a*, clamp *b*, and springs *s* with the tub or vat O, substantially as and for the purpose set forth.

137,235.—*Swinging Crib or Hammock.*—DE COURCY O'GRADY, Charleston, Ill.

The four posts or uprights held in position at the top by pivots passing through slots in the cap, to which pointed uprights or pins are inserted to hold in position the seat on its top. The seat is removable at will, and when removed the supporting-posts or uprights can be brought in close connection for transportation. Appended to the cap, by ring and screw-bolt, is a spiral or coiled spring; from the spring four cords connected at their top; to the cords is appended the crib with its mattress table, &c.

Claim.—1. The combination of the cap A, posts A^1, the staples in their upper ends, and the rods A^1 A^1, whereby the posts are held in position when in use, and provision is made for folding the posts when desirable, substantially as set forth.

2. The combination of the folding-bed B^1, frame B, and table C, substantially as and for the purpose set forth.

137,236.—*Spindle for Spinning-Machines.*—WILLIAM G. PERRY, Manchester, N. H.

The spindle is dragged around by the friction of the whirl and bobbin has a bulb on its lower end, which prevents it from being raised while doffing; and is removable downward by unscrewing the step.

Claim.—1. The bobbin or spool and the spindle *a*, whirl *b*, and tube or cup *c*, connected and relatively arranged substantially as shown and described.

2. In combination with the spindle and tube, the removable step *n* and the bulb *o* upon the foot of the spindle, substantially as shown and described.

137,237.—*Door-Check.*—BRITTON POULSON, Fort Wayne, Ind.

A rubber wheel is secured to one end of an arm, which is pivoted at or near its center to a base-plate, on which it oscillates, actuated by a spring. At a suitable distance from the pivot a foot-piece is formed, and at the other extremity over the wheel is another foot-piece for adjusting purposes. The base-plate is also provided with projections or flanges, which serve as a double stop. By pressing the wheel downward it impinges on the floor, and when released by the foot-piece is held by the spring in normal position.

Claim.—The combination of elastic wheel A, pivoted arm *b*, base-plate *d*, spring *h*, inclined plane and stop *i*, and foot-pieces *f* and *g*, the whole being constructed, arranged, and operating substantially as specified.

137,238.—*Car-Coupling.*—ADAM PRITZ, Dayton, Ohio.

Claim.—The coupling-pin D, constructed as shown, and provided with a central opening, D', which has the general form of a triangle with round corners and concave sides, in combination with the draw-head A, substantially as and for the purpose specified.

137,239.—*Spindle-Bolster.*—GEORGE RICHARDSON, Lowell, Mass.

Claim.—1. An upright shaft or spindle bearing or bolster, having the annular trough *b*, the tubular extension *c*, and one or more capillary eductа, *e*, all arranged substantially as described and represented.

2. The felt or absorbent ring *a*, the annular trough *b*, the tubular extension *c*, and one or more inclined capillary eductа, *e*, combined and arranged substantially in manner, and to operate with a shaft or spindle, as explained.

137,240.—*Feather-Renovator.*—JAMES B. RILEY, Muncy, Pa.

A stirrer revolves in the interior fixed renovating-chamber; about the heads and bottom of this are steam spaces; steam is admitted at will into these spaces or the inner chamber, or both. The condensed steam and dirt in the inner chamber falling through the grate on the bottom, are taken from thence by a pipe. The condensed steam, &c., in the outer spaces may flow off by same pipe. One of the standards is slanted off at its top, and the gearing-box forms a strap so that the cylinder can be tipped forward down this incline.

Claim.—1. The cylinder B, having steam spaces in each head and steam and dirt chambers G I in its bottom, in combination with the pipes *d* and *b* and stop-cock K, which connects with both, as and for the purpose set forth.

2. In combination with the above the pipe *m*, used for allowing an exit for the steam and dirt from the chambers G and I, as set forth.

3. The combination of the cylinder B with the standards A, by which it is supported, when one or both of said standards are so formed that the cylinder may be tilted and supported in that position, as is herein set forth.

137,241.—*Hame for Harness.*—CLARK ROBINSON, Eau Claire, Wis.

The tug-loop is adjustably hooked between hooks and secured by means of a dog, which is itself secured by the breast strap ring.

Claim.—1. The plate E, provided with the recessed lugs F and perforated lugs or ears G, in combination with the link H and tug-clip I, substantially as and for the purpose specified.

2. In combination with the plate E, provided with the lugs F and perforated ears G, and with the link H, constructed as shown, and hinged within said ears, the breast-strap ring K encircling the inner bar *h'* of said link, substantially as and for the purpose shown.

137,242.—*Water-Wheel.*—BENGAMEN RUOF, Zoar, Ohio.

The gate, bed-plate, and wheel are so constructed that the water has but a short distance to travel through the gate and bed-plate before acting on the buckets of the wheel. The frame-work is arched and supports the upper bearings of the shaft, and these parts are connected by braces for strengthening them. The buckets have a peculiar curve, whereby the water is discharged with the least delay and the greatest economy of centrifugal force.

Claim.—1. The concave-convex gate D, in combination with the bed-plate C of similar form, arranged substantially as shown and described.

2. The bed plate C formed with the central dome or hub G, substantially as shown and described.

3. The arched frame-work K, in combination with the bed-plate C and bolts L, substantially as shown and described, for the purpose specified.

4. The buckets M, made in the form shown and described, in combination with the rims b^2 b^3 of the casing, said buckets being curved in such form and arranged in such position that the water is received in a direct line and discharged instantaneously in nearly a radial direction, substantially as specified.

137,243.—*Musical Instrument.*—ALBERT SCHOENHUT, Philadelphia, Pa.

A set of metallic plates are mounted upon a sounding-box, and operated by down-striking hammers attached to keys like a piano.

Claim.—1. The arrangement of the plates A upon a sounding-box, B, beneath the hammers D, as and for the purpose set forth.

2. The combination of the slotted plates A, sounding-box B, its pins *a*, and the isolating material arranged between the box and plates, as and for the purpose described.

3. The combination of the keys F and hammers D having elastic shanks and connected positively with the keys, as and for the purpose specified.

4. The hammers D and keys F, in combination with the connecting-rods *i* and springs *j*, for the purpose described.

137,244.—*Soldering-Tool.*—JOSEPH SEARS, Chicago, Ill.

A jet of mingled inflammable gas and air is conducted through a flexible pipe common to both, into which pipe they are each introduced under pressure. The soldering-tip is formed with a concavity that incloses the end of the handle-tube and keeps the flame entirely within the tip.

Claim.—1. The combination of the gas-pipe G, air-pipe H, flexible mixing-tube E, and the tubular soldering-tool A B C D, substantially as and for the purposes described.

2. The hollow tip A, formed with a cavity which incloses the end of the handle-tube C, so as to locate the flame completely within the hollow tip, as explained.

137,245.—*Machine for Pressing the Soles of Boots and Shoes.*—GEORGE F. SEAVER, EDWARD W. SOUTHWORTH, and JOHN M. ANTHONY, Ashland, Mass.

Two dies, representing relatively the shape of the upper and lower faces of a sole, are arranged in a suitable press, one above the other, so that when brought together a lateral as well as vertical pressure is automatically given to the sole, leaving it in the shape that it is desired to assume when the boot or shoe is completed.

Claim.—1. A machine for pressing the soles of boots and shoes, &c., provided with adjustable curved dies K and *l*, arranged and operated substantially as shown, so that a vertical and lateral pressure is at the same time brought to bear upon a sole of a boot or shoe, &c., and form it in the desired finished shape, substantially as specified.

2. In a machine for pressing the soles of boots and shoes, &c., adjustable dies K and *l*, formed with curved projections K' *l'*, and vertical flanges K'' *l''*, and arranged and operated substantially as specified.

3. In a machine for pressing the soles of boots and shoes, &c., a curved adjustable die *l*, arranged as described, in combination with a sliding bed or platform, *p*, arranged and operated substantially as specified.

4. In a machine for pressing the soles of boots and shoes, &c., cams *u*, arranged on and operated by shaft *v*, cog-wheels *x y*, and shaft *y'* in combination with the bifurcated arms *t*, and bed or platform *p*, arranged and operated substantially as specified.

5. The combination of dies K *l*, head *e*, beams *f*, crank-rods A, shaft *v*, cog-wheels *x y*, shaft *y'*, standards *b b* and *w*, and frame *a*, all arranged and operating substantially as and for the purposes specified.

6. The combination of dies K *l*, platform or bed *p*, head *e*, standards *b b*, beams *f*, shafts *v y'*, cog-wheels *x y*, cams *u*, bifur-

cated arms *t* and frame *a*, all arranged and operated substantially as specified.

137,246.—*Hand-Planter.*—DAVID B. SEELEY, Sterling, Ill.

An oblong box with a plunger seed-cup slide, which, in its descent, deposits in a cup on the face of the box the seed, which, on the rise of the plunger, falls through another orifice in it to the ground through the jaws. Just above the latter there is an opening with a bent spring-plate above it, acting, by pressure of the foot, as a scraper for the plunger.

Claim.—1. The plunger G with its seed-openings, in combination with the spring-clapper D, as and for the purposes set forth.

2. The spring-scraper I, struck up from the foot or nozzle B B, and used in combination with the plunger, as and for the purpose specified.

137,247.—*Revolving Rake.*—ABSOLAN B. SHARP, Labadieville, La.

A revolving rake, having four rows of teeth, the ends of which are concave so as to conform to the surface of the ground between the furrows, is mounted on the rear of a sled and drawn lengthwise of the ridges.

Claim.—A pea and bean vine rake consisting of the revolving rake B C, the teeth of unequal lengths to rake in the furrows and on the ridges, as described, frame A, pivoted stop D E, lever F, and connecting rod or link G, as and for the purpose set forth.

137,248.—*Table-Caster.*—THOMAS SHAW, Providence, R. I., assignor to GORHAM MANUFACTURING COMPANY, same place.

The caster is of oval form, and has under its base or bottom a swivel-standard, so that it may be rotated.

Claim.—The improved oval caster having beneath its bottom or stationary standard B a swivel-standard upon which the caster may rotate, substantially in the manner shown and described.

137,249.—*Furniture-Caster.*—CEVEDRA B. SHELDON, New York, N. Y.

The socket is formed of two concentric sheet-metal cups, with a rubber ring between them. The inner cup carries small friction-balls, which revolve over the surface of a large caster-ball partially inclosed therein. At the bottom of the inner cup is a circumferential enlargement to prevent the binding of the friction-balls, and at the top is a circular depression to prevent the balls from passing entirely to the top of the large ball. A screw is passed through the outer case, and then made rigid therein by means of a cup-shaped nut. The upper end of the screw has an independent thread, which serves to secure the entire caster in the leg of a piece of furniture.

Claim.—1. A caster-socket formed of two concentric sheet-metal cups, the inner one, B, having the circumferential enlargement F at the base and the cavity or bent-in portion H at the top, as shown and described, for the purpose specified.

2. In combination with the caster, the elastic lining E, substantially as and for the purposes described.

3. A caster with a fastening-screw, made rigid therein by means of a cup-shaped screw-nut, substantially as seen at J, as and for the purposes described.

4. A caster having a fastening-screw, provided with a square head and two separate screw-threads thereon, substantially as shown and described.

137,250.—*Furniture-Caster.*—CEVEDRA B. SHELDON, New York, N. Y.

A conical cavity is formed in the bottom of a trunk, and a struck-up metallic plate is fitted therein. Tongues or clips are struck up from this plate and serve to secure the caster firmly, by being bent over the rim of the caster-cup. Thus security is afforded against knocking off the caster in handling the trunk.

Claim.—The ball-holding cup E secured in the cavity of the trunk-frame by means of the clips or tongues H, struck from the metal plate lining the cavity, and bent over the rim of said cup, as specified.

137,251.—*Furniture-Caster.*—CEVEDRA B. SHELDON, New York, N. Y.

A series of small friction-balls are arranged in an annular groove formed between the turned-out flange of the cap or upper plate and the inner side of a metallic cup, which is inserted within the box formed above the wheel-frame. The central portion of this interior metallic cup is forced upward, and around this center another series of friction-balls revolve.

Claim.—1. In combination with a caster, a casing composed of two or more parts, one of which is attached to the stand or bracket and the other to the fastening-screw or plate, with friction-balls between the two, substantially as shown and described.

2. The friction-balls K, arranged in the annular groove I, formed between the inner side of the cap G and the turned-out flange of the cup D, as and for the purpose specified.

137,252.—*Power-Loom.*—JOHN SHINN, Philadelphia, Pa., assignor of one-half his right to JOHN DOBSON and JAMES DOBSON, same place.

Claim.—1. The cord A, arranged in vertical and parallel lines and secured to the ends of the heddle-frame and connected with the operating parts of the loom, as described.

2. The combination, with the heddle-frame end pieces *a a*, of the eyebolts *c c c c* for fastening and adjusting the heddle-frames on the cord A, as shown and described.

137,253.—*Railroad-Rail Joint.*—GEORGE W. SKAATS, Cincinnati, Ohio.

Claim.—The combination of rails A A' *a a'*, fish plates B B', and bolts C, when the plate B not only forms a part of the rail tread, but is fitted and supported in a prepared bed, *b*, in the rails, substantially as and for the purpose specified.

137,254.—*Harrow.*—JOSEPH SMITH, Woodland, Mich.

Connecting four sections of a harrow together by means of a center piece provided with double slots, which receive corresponding tenons on the end of each section.

Claim.—A harrow composed of smaller harrows, which are connected together by a central coupling, D, the whole constructed and operating as and for the purpose set forth.

137,255.—*Insect-Trap.*—J. MCN. SMITH, Fort Wayne, Ind.

A corrugated pan, with an inverted rim for a base to which are attached two woven-wire cones, the inner and shorter one having openings to admit the insects to the larger outer one.

Claim.—The combination of the corrugated pan A, having cavity *a* and beveled edge *b*, the cone B with open conical points *d d* and band D, the top C with band D', and the ears *f f* with pins *f f*, all constructed and arranged substantially as and for the purposes herein set forth.

137,256.—*Machine for Cutting Nicks in Umbrella-Runners.*—OREN M. SMITH, Philadelphia, Pa.

The pocketed disk that supports and presents the blanks is rotated intermittingly by a pawl on the end of a reciprocating bar that has an elevated surface near its point of junction with the pawl that is attained to by a gradual slope, and on this bar rests a vertical rod that carries a lateral arm, from which depends a bolt designed to enter any of a series of holes in the ratchet-wheel. The reciprocation of the bar, and the consequent elevation and depression of the rod, alternately bolts and unbolts the ratchet-wheel.

Claim.—The combination of the ratchet i^1, reciprocating pawl i^2, the retainer q^2, and the inclined projection *z* on the pawl, whereby, on the forward and backward movements of the latter, the retainer is alternately raised and depressed, substantially as and for the purpose specified.

137,257.—*Tag-Holder.*—ELISHA C. STILLMAN, Hopkinton, R. I., and EDMUND F. BURROWS, Mystic River, Conn.

A flanged plate holds the card, and carries, hinged to one of its sides, a spring-ball, which swings down under the flange to secure it.

Claim.—1. A tag-holder composed of a plate, A, having a lap, A^1, and a spring-clamp, B, connected to the plate and adapted to be sprung under the lap A^1 thereof, substantially as and for the purpose specified.

2. The combination of the plate A A^1 *a*, and spring-clamp B *b b'*, pivoted thereto, substantially as and for the purposes specified.

137,258.—*Fluting-Machine.*—THEODORE STOCKMARR, New York, N. Y.

Two endless chains pass around rollers, and are arranged relatively to each other, so that their links engage together as the teeth of ordinary fluting-rollers.

Claim.—The combination, in a fluting-machine, of the two chains A and B, the one having round-headed links and the other having T-headed links, substantially as and for the purpose herein set forth.

137,259.—*Weighted Gage-Cock.*—STEPHEN P. M. TASKER and WILLIAM H. MCMILLAN, Philadelphia, Pa., assignors to MORRIS, TASKER & CO., same place.

The valve is constructed to be readily removed, and the lever so formed as to be limited in its movement and to move said valve.

Claim.—1. The combination of the valve B with the lip *h* on the inner end of the lever D for arresting its upward movement, in the manner and for the purpose set forth.

2. The combination of the valve B and the bifurcated hooks A on the lever D, for drawing the valve from its seat, substantially as specified.

3. The combination of the body A, the cylindrical valve B, and a weighted lever with the lip *g* and hook *k'*, substantially as described.

137,260.—*Spring-Bed.*—DAVID E. TAYLOR, Charlton, Mass.

Lever-springs with bent ends are secured at the base by a button inserted through the coil and held by a screw. Coiled springs, supporting slats, are held by a button of peculiar form fixed to the under side of the slat. The webbing is attached at the lower end to a removable slotted plate, and passes over the lever-springs.

Claim.—1. The combination, with the canvas F, of tension-springs C, having their upper parts bent substantially as shown in the drawing at *c*, and for the purposes set forth.

2. The tension-springs C, having an upper supporting-bend, *c*, and lower coiled and bent ends, substantially as shown and described.

3. The holding-buttons K, substantially as and for the purposes set forth.

4. The combination, with the springs B and slats J, of the buttons K, substantially as and for the purposes set forth.

5. The combination, with the base-rail A and canvas strap F, of the slotted holding-parts G, substantially as and for the purposes set forth.

6. The combination, with a base-rail A and canvas F, of the tension-springs C, buttons *a*, and screws *b'*, substantially as and for the purpose set forth.

7. The combination, with the base-rail A and slats J, of the tension-springs C, canvas F, supporting-springs B, attaching parts G, and buttons K, substantially as and for the purposes set forth.

137,261.—*Rotary Steam-Engine.*—HENRY TAYLOR, Baltimore, Md.

A stationary case, provided with a series of faces and inclines, is combined with a series of steam-cylinders carried by and radiating from a rotary hub or steam-chest, whose axis of revolution is the center of the stationary case, the said cylinders receiving steam at their inner ends and containing pistons provided with piston-rods having rollers, which work against the faces and inclines. Steam is admitted and exhausted by segmental adjustable valves with a central exhaust-passage.

Claim.—1. The combination, with a stationary case provided with a series of faces and inclines, as described, of a series of steam-cylinders carried by and radiating from a rotary hub or steam-chest whose axis of revolution is the center of the stationary case, said cylinders receiving steam at their inner ends and containing pistons provided with piston-rods adapted to work against the faces and inclines of the stationary case, at the times and in the manner substantially as shown and set forth.

2. In combination with the rotary hub or steam-chest, the stationary valves located within the same and arranged to admit steam into and exhaust it from the cylinders carried by said hub or steam-chest, substantially in the manner and for the purposes set forth.

3. In combination with the elements named in the preceding clause, the central exhaust and steam-admission pipes, under the arrangement and for operation substantially as shown and set forth.

4. The arrangement of the valves in pairs, each pair being supported upon and communicating through an exhaust-passage with a tubular stem radiating from and opening into the central exhaust-pipe, substantially as shown and described.

5. The arrangement of the valves upon a central stem capable of being rotated to shift the position of said valves in relation to the cylinder-ports, in order to reverse the engine or to regulate at will the cut-off, substantially as shown and set forth.

137,262.—*Counting-Register.*—GEORGE H. VAN VLECK, Buffalo, N. Y.

A series of wheels numbered on their peripheries, and having on one side a segmental flange and on the other a circular row of pins, is mounted loosely on short shafts bearing arms at right angles on each side of the wheels. The arms are connected at their outer extremities to arms of adjacent shafts by pins, which serve as shafts for pinions of four leaves, each leaf of which has a curved groove cut across its face to fit over the segmental groove of one wheel, a leaf fitting between two pins of the opposite wheel. Half way between the ends of the flange is a pin which strikes a leaf of the pinion as one end of the flange passes from its groove and turns the pinion, thus causing the next wheel to advance one number, while the groove in the following leaf of the pinion is brought in position for the other end of the flange to pass into it and lock the pinion from turning further.

Claim.—1. I claim the construction of the numbering-wheel A, having on one side the pins *d d*, and on the other the segmental guide *f* and carrying-pin *h*, and moving on short shaft *a*, all arranged as and for the purpose hereinbefore set forth.

2. I also claim the locking and moving pinion or catch-wheel C, formed as described, and arranged between each numbering-wheel, and in combination with the pins *d h* and guide *f*, on wheels A A, as and for the purpose hereinbefore set forth.

3. I claim the mechanical movement produced by means of the wheels A A, having the pins *d d h*, and guide *f*, and the catch-wheel C, all arranged, constructed, and operating as hereinbefore fully specified.

137,263.—*School-Desk.*—DAVID GLASS VENABLE, Christiansburg, Ky., assignor to WILLIAM T. VENABLE, same place.

The book-boxes are located at or near the back of the desk-top, and are provided with hinged lids opening toward the front of the desk. The permanent part of the desk-top comes next to the scholar setting at the next seat in the rear.

Claim.—The book-boxes D D, with their beveled lids C C hinged as described, in combination with the desk-top T with its edge beveled as shown, constructed and arranged substantially as set forth.

137,264.—*Car-Brake.*—ISAAC H. VOORHIES, Ypsilanti, Mich.

By turning the brake-wheel the chain which passes around the drive-wheel axle is tightened, and turns a pulley which is fastened to its shaft. To this shaft is secured a chain, which passes around the car-axle, and the other end is fastened to the brake-lever. This chain, being wound about the shaft, operates the brake-lever. Also, the additional friction on the car-axle acts as an extra brake-power. The brake-chains, where they come in contact with the axle, are provided with wear-irons, which are dovetailed into their links.

Claim.—1. The arrangement, substantially as herein described, of the chain *b*, pulley E, and center shaft G, for operating the brake-lever, as herein set forth.

2. The arrangement of the drive-axle I, cord *d*, pulley *e* on the brake-wheel, and rod J, and the pulley H on the center-shaft G for turning said shaft, substantially as shown and described.

3. The wear-irons *h h* dovetailed into the links *f f* of the chain where said chain passes around the axle, substantially as herein set forth.

137,265.—*Car-Replacer.*—HENRY VOTH, St. Louis, Mo.

The inclined skid forms a track for the wheels of the displaced car to ascend upon for the purpose of replacement, its upper end being clamped firmly to the rail by means of the notched cams.

Claim.—The notched cams B B, arranged to automatically clamp the rail by the weight of the frog, in combination with the skid D, substantially as and for the purpose set forth.

137,266.—*Car-Wheel.*—ALANSON B. WAKEFIELD and BAYARD A. BERRYMAN, St. Louis, Mo.

Peculiarly flanged caps for securing the truck to the wheels; also serving as part of an oil-chamber.

Claim.—1. The oil-chamber, consisting of the fixed members A B and rotating members G *f* connected by a coupling, *b b' g' g''*, substantially as and for the purpose set forth.

2. The combination of the axle A, collar B, bearing-collar C, case G, and wheel F with the truck-frame D, substantially as and for the purposes set forth.

3. The combination of the axle A, collar B, case G, wheel F, and cap K, substantially as and for the purposes set forth.

137,267.—*Differential Gearing for Hoisting Apparatus, &c.*—JUSTUS WEBSTER and JOHN H. WEBSTER, Boston, assignors to themselves and LORENZO D. HAWKINS, Stoneham, Mass.

A center pinion-wheel on the driving-shaft meshing into and rotating one or more loose pinion-wheels, the teeth of which, opposite to the center pinion, mesh into teeth on the interior surface of an outer or gear-encompassing ring or pulley, the driving-pinion having one set of teeth, which mesh into corresponding teeth of the auxiliary pinions, and each of the latter pinions having upon one or upon each side of the main teeth another set of teeth, the side pinion formed by such teeth being of less diameter and, of course, less number of teeth, the pinion of lesser diameter meshing into one set of teeth on the inner surface of the stationary gearing-frame, and the large pinion meshing into a set of internal teeth, the ring or part of the ring embracing which will, of course, be of correspondingly larger diameter.

Claim.—The combination of the driving-pinion *e*, differential pinions *f*, and the internal gear-rings *g k*, with their differential gear-teeth.

137,268.—*Rain-Water Cut-Off.*—JEROME W. WETMORE, Erie, Pa.

The handle, which is made in the form shown and passes through the top of the box, is for the purpose of operating the chute so as to throw the water either into the side pipe or into the discharge-pipe.

Claim.—The handle F G R S of the chute of the rain-water cut-off attached to its upper end, and passing through the cover B of the box, substantially as and for the purpose specified.

137,269.—*Endless-Chain Propeller.*—JOHN W. WHEYATES, Liverpool, England.

Endless-chain propellers are mounted in a vertically-adjustable frame and revolve around sprocket-wheels, the lower one being of a triangular form so as to change the floats from a horizontal to a vertical position, and vice versa, as they enter and leave the water. An endless revolving chain-propeller is contained in an upright cylinder at the bow or stern, and the cylinder, being turned horizontally or laterally by a steering-wheel, has the effect to turn and steer the vessel.

Claim.—1. A chain-propeller mounted in an adjustable frame carrying the chain-wheels *d*, and the angular wheels *g*, around which the chain, with the propellers or buckets, passes, substantially as set forth.

2. The cylinders *k* and *m*, in combination with the chain-propeller *f A*, and mechanism for revolving the cylinder *m*, substantially as and for the purposes set forth.

137,270.—MOSES K. WHIPPLE, Warren, Mass.

Claim.—A copper-faced cast-iron pulley, substantially as and for the purposes set forth.

137,271.—*Reversible Knob-Latch.*—ANDREW F. WHITING, Crestline, Ohio.

The latch-bolt is swiveled to the yoke or supporting frame in such manner that by disengaging a pawl, which holds the latch in position, it is allowed a limited end movement, sufficient to permit of its being reversed.

Claim.—The combination of a supporting-frame with the independent endwise movable and reversible bolt A B, the shank of which is cylindrical in form, and supplied with notches *b* b^1 and head b^2, pawl D D', and actuating-spring E, substantially as shown and described.

137,272.—*Reversible Knob-Latch.*—ANDREW F. WHITING, Crestline, Ohio.

The hub is provided with an aperture for the reception of a cross-bar, which serves to retract the latch when the hub is rotated. This cross-bar is held in position by means of the knob-spindle. On the removal of the latter the cross-bar may be slid in one direction by its own gravity, so as to release one of the lugs on the carriage, which will allow the latch-bolt to be projected far enough to permit of its being reversed.

Claim.—In combination with the lugs *c c'* of the carriage B, the movable cross-bar E, provided with shoulder *e* and nick *e'*, and hub F, having an aperture in the enlargement F', substantially as and for the purpose set forth.

137,273.—*Reciprocating Steam-Engine.*—JOHN W. WILBRAHAM, Philadelphia, Pa., assignor to himself, THOMAS WILBRAHAM, and JAMES WILBRAHAM, same place.

A vibrating arm on the rock-shaft is operated by a hand-lever, and is connected to the slide by a link. The slide connects by the valve-stem with the valve, and moves in a suitable guide. The eccentric-rod can be thrown out of gear by a guided rod having a roller on its end, and is operated by a treadle.

Claim.—The combination of the slide A attached to the valve D and operated by an eccentric with the rock-shaft J, arm E, and link G.

137,274.—*Manufacture of Fifth-Wheel for Carriages, &c.*—DARIUS WILCOX, Derby, Conn.

The several cavities of the dies are so related to each other in position, and so shaped in cross-section, as to accurately mold the principal bar and its two lateral arms from a blank previously forged to a shape approximating that of the finished article.

Claim.—Dies A B, constructed with cavities of the forms herein specified, for forming clip-heads for fifth-wheels of vehicles, in the manner and for the purposes set forth.

137,275.—*Chest-Protector.*—EDWARD F. WILDER, West Roxbury, assignor to JAMES W. TUFTS, Medford, Mass.

The ordinary chest-protector, composed of several thicknesses of felt or flannel, is provided with a thin sheet of rubber placed between the different layers. Thus the perspiration is prevented from reaching the outside, this being objectionable for the reason that the cold air striking the wetted protector chills the wearer and defeats the object of the device.

Claim.—A chest or lung protector, composed of two thicknesses of felt, flannel, or other suitable material, with a film or thin layer of rubber or gutta percha placed between them, substantially as and for the purpose set forth.

137,276.—*Lamp-Burner.*—JOSEPH N. WYATT, Baltimore, Md.

The lamp-cap has an annular perforated plate, under which is an inclining shield to direct the gases from the oil to the flame and the dripping oil back to the reservoir. The wick-tube is surrounded by an auxiliary tube, and is screwed into a flange on the perforated plate.

Claim.—The collar C, consisting of an outer wall, *e*, perforated flange-plate *e*, ring-plate *d*, having female-screw-thread on its inner face, and annular inclined shield-plate *f*, the whole being so combined and arranged as to operate substantially as described.

137,277.—*Hot-Air Furnace.*—THEODORE YATES, Milwaukee, Wis.

Through the apex of a conical grate air is delivered from the apartment at a point above the fire. The air-pipe serves as a ventilator for the apartment. The lower part of the conical grate has movable bars which can be agitated by a handle. The smoke-flues depend into the combustion-chamber and retard the escape of products of combustion.

Claim.—1. The conical grate B, constructed substantially as described, with an opening at its apex to admit air directly above the fuel, as and for the purpose set forth.

2. In combination with the grate constructed substantially as described, the air pipe I, extending outside of the furnace, as and for the purposes described.

3. The combination of the grate provided with the cross-bar *g* and eyes *k*, the rock-shaft C provided with the pivot A, and the rod M, arranged to operate as described.

4. The smoke-flues extending downward within the chambers, as shown and described, for the purpose of retarding the escape of the smoke and gases, as set forth.

137,278.—*Broiler Attachment for Stoves and Ranges.*—JACOB S. YORK, Brooklyn, N. Y., assignor to himself and JAMES H. SELKENS, same place.

A vertical grate, single or double, is so adapted to the usual fire-grate as to expose one side to the fire and contain the broiler in the other. There is a suitable drip-pan for the broiler.

Claim.—1. The vertical grate or perforated partition A arranged in the fire-space of a stove or range for producing a vertical broiling-chamber, as set forth.

2. The combination with each other of two vertical grates or perforated partitions, A, within the same fire-chamber of a stove or range to allow broiling between two fires, as set forth.

3. A stove or range provided with a vertical broiling-chamber, as specified.

4. The narrow trough or pan E arranged in combination with the broiler D for use in a narrow vertical broiling-chamber, as specified.

REISSUE PATENTS.

5,332.—*Cotton-Bale Tie.*—GEORGE BRODIE, Plum Bayou, Ark., assignor to JAMES JENNINGS MCCOMB, Liverpool, England.—Patent No. 22,291, dated March 22, 1859; reissue No. 3,405, dated April 27, 1869; extended seven years.

Combination with open slot-ties of metallic bands having their ends looped, and held in position by the expansion of the bale.

Claim.—1. The swell or curve in the link, for the purpose of facilitating the introduction of the bands with their inserted pins, substantially as described.

2. The double lap of the band, as shown in Figs. 11 and 12, in combination with a metallic link.

3. The combination of an open slot for introducing the band sidewise, with a link having a single rectangular opening for holding both ends of a metallic band, and the band.

4. An open slotted link, when combined with metallic bands, the ends of which are turned under the link and held in position by the expansion of the bale.

5. The method of baling cotton with metallic bands, and of taking up the slack of the band by bending the same at any desired point into the form of a loop and passing such loop sidewise through an open slit into the slot intended to receive it and over the bar of the clasp intended to hold it.

5,334.—*Hoop-Skirt.*—THOMAS B. DE FOREST and THOMAS S. GILBERT, Birmingham, Conn., assignors, by mesne assignments, to ALEXANDER K. YOUNG.—Patent No. 74,672, dated February 18, 1868.

Narrow metallic springs (one or more) are inclosed by a fabric of textile material, or textile and paper combined, said springs being held in place and permanently apart by a cement of peculiar character, constituting, as it were an artificial spring wider than the wire employed, and rendering the fabric to a certain extent unyielding and non-compressible.

Claim.—A skirt-hoop composed of two or more wires kept permanently apart at a regular distance from each other by means of a covering, in which they are inclosed, and a cement substantially of the character described, which, when set, renders the whole fabric more unyielding, as set forth, the object being to produce a broad and firm elastic skirt-hoop lighter and cheaper than if made entirely of metal, and yet practically possessing all the valuable qualities of metal.

2. A skirt-hoop composed of only one wire, inclosed within a covering wider than the wire by means of a cement substantially of the character described, which, when set, renders the whole fabric more unyielding, substantially as described.

3. A skirt-hoop composed of one or more wires, inclosed within a covering of paper and cotton or some other textile fabric, combined and cemented on the wires by a cement, which, when set, renders the whole fabric more unyielding, substantially as described.

5,335.—*Double-Friction Coupling.*—JOSHUA HENDY, San Francisco, Cal.—Patent No. 25,733, dated October 11, 1859.

Claim.—1. The application of two such truncated-cones to one coupling, one at either end, and operated by a single lever, so as to work in cavities or conical sleeves attached to pulleys or wheels arranged on one shaft, so that said shaft may be run slow or fast, or backward or forward, or entirely stopped, without stopping the prime motor or changing its speed, substantially as herein set forth and explained.

2. The lever E, in combination with the double-acting friction device, substantially as set forth.

5,336.—*Sewing-Machine for Making Button-Holes.*—EDMUND HOWARD, Flushing, and WILLIAM H. JACKSON, Brooklyn, N. Y., assignors, by mesne assignments, to HENRY E. TOWNSEND, CHARLES P. BRIGHAM, and GEORGE W. SIMMONS, Boston, Mass. Patent No. 94,212, dated August 31, 1869.

The vibrating finger takes the shuttle-thread from the under-thread catcher and carries it over the edge of the fabric where the loop so formed is entered and confined by the needle and its thread. The device is operated by means of cams on the shuttle-driver.

Claim.—1. The improved under-thread catcher, consisting of an arm with an eye near its end, when constructed and operating so that it shall move away from the throat of the machine with the under thread, while the needle is above it, and return to the throat, so that the needle shall pass through it at each descent, all substantially as set forth.

2. The vibrating finger F, when constructed and arranged substantially as described, and moving not only on its pivot but also bodily in order to carry the under thread up over the edge of the fabric, and then move out of the way of the needle, as set forth.

3. The special mechanism for giving the two motions to the finger F, above set forth, said mechanism consisting of the two elbow-levers, D and E, connected together by the pin on one arm of the lever E, and the link on one arm of the lever D.

4. A thread carrier and catcher, substantially as described, provided with pins *i j* and operated by cams *a*, *b*, *b'*, and *k*, substantially as set forth.

5. The pivoted wedge-shaped piece T, in combination with the rocking-arm I for varying the extent of the feed motion, substantially as described.

5,337.—*Grain-Weighing Machine.*—FRANCIS S. MCWHORTER, St. George's, Del.—Patent No. 83,298, dated October 20, 1868.

A sack-supporting frame is suspended from a scale-beam which carries an arm and plate so arranged as to cut off the supply of grain to the sack by compressing the flexible tube or delivery spout, when the required weight causes the sack and its supporting-frame to preponderate.

Claim.—1. The combination of a steelyard, carrying a grain-receptacle, with a flexible sleeve, V, and with the mechanism described, or its equivalent, for arresting the passage of grain through the sleeve on the descent of the receptacle.

2. The within-described arresting device, consisting of a flexible sleeve contained within the spout A and a slide, W, or its equivalent.

3. The sack-holder, consisting of bars L L and cross-plate T suspended from the steelyard, as set forth.

4. The cross-plate T, readered adjustable vertically on the suspension-bars of the sack-holder, as and for the purpose specified.

5. The within-described retainer for the mouth of the sack, consisting of the bars Q and dogs *f* combined with the suspension-bars, all substantially as set forth.

5,338.—*Tassel-Clip for Window-Shades.*—FREDERICK MÜLLER, Boston, Mass.—Patent No. 85,953, dated January 19, 1869.

The clip is formed with two jaws with inwardly-inclined lips, and held in position by a spring secured to the jaws.

Claim.—1. A clip, constructed of side-jaws or plates A, hinged together and provided with an inward-projecting flange or lip, *e*, substantially as and for the purpose described.

2. A clasp, consisting of the jaws or plates A and the spring B, united together by means of the lips *e*, all substantially as shown and specified.

5,339.—*Attaching Handles to Cross-Cut Saws.*—ISAAC PELHAM, Elmira, N. Y., assignor to EMANUEL ANDREWS.—Patent No. 30,153, dated September 25, 1860.

The arrangement of parts places the handle at the extreme end of the saw, and allows it to be easily disengaged should the saw become caught in a log, rendering such removal necessary.

Claim.—The combination of the handle to a cross-cut saw, attached by one of its sides to the extreme end of the saw-blade, and rods for securing the handle to the saw-blade, in the manner and for the purposes substantially as shown and described.

5,340.—*Hot-Air Engine.*—ALEXANDER K. RIDER, New York, N. Y.—Patent No. 128,979, dated July 16, 1872.

The air, being compressed in the supply-cylinder, is admitted through the waist-piece into the working-cylinder, where its effect is increased by being expanded by heat. The pistons and exhaust-valve are so arranged that the latter closes before the working-piston has completed its descent, thus equalising the degree of compression in the two cylinders.

Claim.—1. The supply-crank G, arranged behind the working crank E, in combination with the exhaust-valve A, and means for closing it before the working-piston *a* has completed its downward stroke, as herein specified.

2. The waist-piece C, in combination with the parts A, A', and B, all constructed and arranged as represented, for the purposes set forth

3. In combination with the working and supply cylinders, with their respective pistons and passages and cranks E G, the valve A, arranged to close so as to induce a compression in the clearance-space equal to the simultaneous compression in the supply-cylinder.

4. The perforated tubular valve J, constructed and arranged, relatively to the packings *k k'* and casing K, substantially as and for the purposes herein specified.

5. The entire combination and arrangement of the supply-cylinder and piston B *b*, connection-passage C, working cylinder and piston A A' *a*, exhaust-passage H, and valve A, with suitable means for operating the latter, by which a portion of the air contained in the compressing or supply cylinder B is blown through the air-passages so as to displace a corresponding quantity of hot air, supplying its place with colder, and consequently denser, air, as herein specified.

5,341.—*Water-Wheel.*—JAMES E. STEVENSON, New York, N. Y.—Patent No. 48,737, dated July 11, 1865.

The buckets of the wheel are between rims, the lower parts of which do not extend down to a common level with the lower ends or lasues of the buckets, but are notched or have recesses, so that the lower parts of the buckets—say, a distance of about a third of their length—are fully exposed at each side. By this means a free lateral discharge is allowed the waters as it leaves the lasues of the buckets. The tail ends of the buckets have an area increasing from the impinging-point toward the point of discharge.

Claim.—The combination, with a turbine wheel, of buckets, the tail ends of which have an area increasing from the impinging-point toward the point of discharge, substantially as herein set forth.

INDEX OF INVENTIONS PATENTED MARCH 25, 1873.

[The numbers in parentheses denote the classification of patents.]

Acid, manufacture of boracic, (35,) F. Gutzkow 137,072
Adding machine, (42,) A. M. Stephenson 137,107
Air from the composition from which artificial stone is molded, expelling, (153,) G. A. Frear 137,193
Alarm and indicator, low water, (148,) J. Ross 137,097
Alkali, incasing caustic, (35,) G. W. Humphrey 137,137
Amalgamator, (3,) F. Morris 137,088
Asthma, compound and apparatus for the cure of, (98,) J. P. Richard 137,093
Bale tie, cotton, (7,) G. Brodie, (reissue) 5,333
Bed, spring, (62,) D. E. Taylor 137,200
Bedstead, (62,) F. G. Ford 137,191
Binder, temporary, (146,) D. Dunton 137,131
Biscuit, machine for cutting, (6,) J. and S. Turner 137,114
Boats, propelling, (139,) J. S. Anderson 137,164
Boiler, culinary, (154,) R. B. Lewis 137,140
Bolt cutter, (14,) W. W. Hill 137,076
Books, machine for rounding and backing, (15,) Foster, Baylis, and Harbin 137,195
Boot and shoe sole pressing machine, (16,) Seaver, Southworth, and Anthony 137,245
Bran duster, (57,) J. T. McNally 137,226
Breast pin tongue, (86,) L. H. Sonnheim 137,154
Brick machine, (30,) R. T. Barton 137,123
Broiler attachment for stoves and ranges, (154,) J. S. York 137,278
Bromine from bitterns, &c., producing, (35,) Leyer and Winter 137,223
Butter rolls, forming and gaging, (45) C. H. Fancher 137,064
Can opener, (88,) J. J. Reed 137,149
Car brake, (122,) J. L. Knowlton 137,079
Car brake (122,) I. H. Voorhies 137,264
Car coupling, (122,) C. H. Gearhart 137,067
Car coupling, (122,) H. E. Marchand 137,225
Car coupling, (122,) A. Pritz 137,238
Car replacer, (122,) H. Voth 137,265
Car wheel, (122,) Wakefield and Berryman 137,266
Carpet fastener, (62,) A. J. Williams 137,118
Carriage spring, (31,) C. S. S. Grifling 137,197
Cartridge capping and uncapping device, (55,) G. S. Greene, Jr 137,071
Casks, pitching, (40,) F. Brenner 137,173
Caster, furniture, (24,) C. B. Sheldon 137,249
Caster, furniture, (24,) C. B. Sheldon 137,250
Caster, furniture, (24,) C. B. Sheldon 137,251
Caster, table, (68,) T. Shaw 137,243
Chair, reclining, (62,) G. D. Goss 137,069
Chair, tilting, (62,) F. A. Parker 137,091
Chair, table, and lounge combined, (62,) J. Croghan 137,062
Chest protector, (156,) E. F. Wilder 137,275
Cock, stop, (150,) J. P. Mern 137,144
Cock, weighted gage, (148,) Tasker and McMillan 137,259
Collar, (38,) G. F. Rice 137,096
Collar pad, (72,) P. H. Beaver 137,049
Cotton, hay, &c., compressing, (7,) F. Weldon 137,160
Coupling, double friction, (87,) J. Hendy, (reissue) 5,335
Crib or hammock, swinging, (62,) D. C. O'Grady 137,235
Cultivator, (43,) M. Lewellin 137,221
Cultivator, (43,) O. M. Pond 137,094
Cultivator, hand, (43,) G. W. Rue 137,098
Desk, school, (62,) D. G. Venable 137,263
Door bolt, (94,) J. Jones 137,211
Door check, (94,) B. Poulson 137,237
Doughnut mold, (66,) G. Machlet 137,142
Earth closet, (8,) I. S. and H. R. Russell 137,099
Engine, dummy, (94,) M. H. Hollock 137,216
Engine, hot air, (2,) A. K. Rider, (reissue) 5,340
Engine or pump, rotary, (118,) L. Chapman 137,056
Engine, reciprocating steam, (150,) A. E. Baker 137,167
Engine, reciprocating steam, (150,) J. W. Wilbraham 137,273
Engine, rotary steam, (150,) W. C. Stiles 137,109
Engine, rotary steam, (150,) H. Taylor 137,261
Engine, vapor, (3,) J. F. Haskins 137,200
Engines, reversing valve for steam, (150,) P. W. Mellen 137,239
Engines, eccentric rod for steam, (150,) J. F. McCutcheon 137,227
Fabrics, machine for opening, smoothing, and guiding, (37,) W. Birch 137,169
Fan, automatic, (165,) W. Fay 137,189
Feather renovator, (48,) J. R. Riley 137,240
Feed cutter, (59,) Bartle and Garlock 137,168
Feed and delivery apron, (28,) P. R. Mansfield 137,224
Fertilizers, treating sewage and ammoniacal waters for the production of, (9,) Christy and Bobrownicki 137,059
Fifth wheel for carriages, &c., manufacture of, (31,) D. Wilcox 137,274
Fire proof shutter, (4,) W. M. Vars 137,158
Fluting machine, (38,) T. Stockwarr 137,258
Fountain and lawn sprinkler, portable, (167,) R. Brusie 137,175
Funnel, measuring, (167,) T. E. Cropper 137,182
Furnace, hot air, (154,) T. Yates 137,277
Furnace, cupola and other metallurgic, (85,) O. Bolton, Jr 137,125
Game table top, (143,) G. G. Thomson 137,113
Gas, exhausting and washing, (96,) Brown and Thomas 137,174
Gas exhausters, governor for, (64,) R. Koch 137,215
Grain weighing machine, (132,) F. S. McWhorter, (reissue) 5,337
Grappler, (79,) S. B. Dexter 137,130
Hammer, power, (60,) S. Peacock 137,092
Harness, horse for, (72,) C. Robinson 137,241
Harrow, (73,) J. Smith 137,254
Harvester, (74,) H. M. Yale 137,162
Hinge, spring butt, (94,) J. A. Clark 137,178
Hoe and roller, combined garden, (63,) E. Blanchard 137,124
Hoisting apparatus, &c., differential gearing for, (67,) J. and J. H. Webster 137,267
Hoisting machine, (79,) L. Smith 137,152
Hoisting machines, safety attachment to, (79,) W. D. Andrews 137,165
Hoop skirt, (66,) De Forest and Gilbert, (reissue) 5,334
Horseshoe, (60,) I. De Mott 137,128
Horse collar fastening, (72,) E. H. Sprague 137,105
Horses, apparatus for cleaning, (144,) Allison and Homelius 137,045
Hose pipe and sprinkler combined, (167,) W. W. Ransom 137,095
Hydraulic motor, (118,) B. A. Bloch 137,171
Hydrocarbon vapor, combustion chamber for burning, (149,) C. J. Eames 137,132
Jack, carriage, (79,) D Hiestand 137,202
Kiln, (30,) R. Connable 137,180
Kiln for drying malt, &c., (19,) J. Gecmen 137,194
Lamp burner, (90,) J. N. Wyatt 137,276
Lantern, (90,) Leffelholn and Prier 137,223
Latch, reversible knob, (93,) W. H. Andrews 137,166
Latch, reversible knob, (93,) R. L. Webb 137,159
Latch, reversible knob, (93,) A. F. Whiting 137,271
Latch, reversible knob, (93,) A. F. Whiting 137,272
Leather, machine for skiving and splitting, (92,) P. D. Cummings 137,163
Lock, indicator, (93,) E. A. Cooper 137,181
Loom, (95,) C. J. Kane 137,077
Loom, power, (95,) J. Shinn 137,252
Loom take up mechanism, (95,) S Estes 137,188
Lubricator, steam, (87,) W. Hamilton 137,073
Lubricator, steam, (87,) W. Cowenlock 127,070
Mantrel, buffing, (70,) G. B. Dunham 137,187
Meat chopper, (23,) J. A. Hard 137,074
Mechanical movement, (67,) A. G. Waterhouse 137,115
Mensuration, apparatus for teaching, (146,) I. Harrington 137,075
Metal castings, machine for grinding, (70,) G. H. Spencer 137,107

Metal lined, copper and other vessels, (113,) J. Matthews. 137,226
Metal vessels, casting bottom on sheet, (33,) R. J. Howdon 137,204
Metal vessels, machine for beading sheet, (136,) C. W. Priest 137,147
Mill, fanning, (159,) L. H. Decker 137,185
Mill pick, (57,) T. R. Way 137,116
Mucilage, (35,) Kloczewski and Mindeleff 137,213
Musical instrument, (102,) W. Leigh 137,219
Musical instrument, (102,) A. Schoenhut 137,243
Organ treadle, (106,) J. A. Smith 137,101
Organ stop action, reed, (106,) J. A. Smith 137,102
Package register, (42,) G. W. Moore 137,231
Pail, dinner, (68,) P. Molan 137,230
Paper, cutting out ornamental forms of, (109,) A. Delkescamp 137,063
Pencil, lead, (146,) T. H. Müller 137,089
Petroleum, lubricating oil from, (87,) J. K. Truax 137,157
Photographic negative baths, heating, (111,) H. J. Sunter. 137,110
Pitcher top, molasses, (88,) G. P. Lang, Jr 137,139
Planter, hand, (133,) D. B. Seely 137,246
Plow, (114,) T. J. and G. M. Clark 137,060
Plow clevis, (114,) A. Kaufman 137,078
Post driver, (52,) I. V. Adair 137,120
Pressing machine, tailor's, (38,) A. C. Sawyer 137,100
Printing press feeder, (117,) R. J. Stuart 137,156
Propeller, endless chain, (139,) J. W. Whinyates 137,269
Pulley, (67,) M. K. Whipple 137,270
Pump, rotary, (118,) L. Chapman 137,054
Pump, rotary, (118,) L. Chapman 137,055
Pump, rotary, (118,) L. Chapman 137,057
Pump, rotary, (118,) L. Chapman 137,058
Pump and engine, air, (12,) T. Beach 137,123
Pumps, clack valve for wooden, (118,) A. Breed 137,196
Purifier, middlings, (57,) Hunter and Whitmore 137,207
Railroad frog, (120,) J. H. Lackey 137,085
Railroad rail joint, (120,) G. W. Skaats 137,253
Railroad switch, (122,) G. W. Billings 137,050
Rake, horse hay, (77,) J. F. Keller 137,212
Rake, revolving, (77,) A. B. Sharp 137,247
Refrigerator, (58,) R. Taylor 137,112
Register, counting, (42,) G. H. Van Vleck 137,262
Register, liquid measuring, (47,) M. Springwater 137,155
Register and stove pipe thimble combined, (154,) C. Hilton 137,203
Road steamer wheel, (94,) J. S. Fisher 137,065
Sad iron, (91,) J. Hewitt 137,201
Sad iron, (91,) W. L. Hubbell 137,205
Sail and marine drag combined, (139,) T. M. Fleetwood ... 137,190
Safe, burglar proof, (128,) W. Corliss 137,061
Saw filing machine, (131,) G. Blythe 137,172
Saw setting device, (131,) J. B. Schmid 137,150
Saws, attaching handles to cross cut, (131,) I. Pelham, (reissue) 5,339
Scissors, device for sharpening, (44,) T. Halvorsen 137,135
Seeding machine, (131,) D. Caine 137,051
Separators, sieve for, (159,) B. and M. Miller 137,145
Sewing machine bobbin winder, (134,) A. B. Bary 137,048
Sewing machine, button hole, (34,) Howard and Jackson, (reissue) 5,336
Sewing machine caster, (134,) J. B Lincoln 137,141
Sewing machine for quilting, (134,) Happe and Newman .. 137,199
Sewing machine treadle, (134,) Clough and Lincoln 137,179
Sewing machine tucker, (134,) D. and E. S. Baraum 137,047
Sewing machine tucker, (134,) J. S. Oakley 137,232
Sewing machine tuck creaser, (134,) J. S. Stewart 137,108
Shearing animals, apparatus for, (144,) C. A. J. Lenevelée 137,220
Shells, combined percussion and time fuse for, (157,) E. Drake 137,186
Skirts, machine for printing and embossing, (38,) H. J. Davies 137,184
Sifter, ash, (170,) S. Smith 137,153
Spark arrester, locomotive, (94,) J. Gibbs 137,134
Spindle bolster, (87,) C. Richardson 137,239
Spinning machines, spindle for, (142,) W. G. Perry 137,236
Spool blanks, machine for making, (175,) J. T. Hawkins .. 137,136
Soda water, dispensing apparatus for, (1,) W. Gee 137,195
Soldering apparatus, (136,) C. B. Koons 137,217
Soldering tool, (136,) J. Sears 137,244
Sole trimming machine, (16,) Gallagher and Coyle 137,066
Stone, marbleized composition, (153,) T. Carson 137,127
Swing, child's, (143,) W. H. Alcorn 137,121
Table, extension, (62,) A. Reed 137,148
Table leaf support, (62,) A. C. Johnson 137,210
Table leaf support, (62,) A. Marchand 137,087
Tag holder, (146,) Stillman and Burrows 137,257
Telegraph, printing, (50,) C. J. Wiley 137,117
Thill coupling, (31,) W. Cable 137,176
Thill coupling, (31,) J. Martin 137,143
Ticket, duplex, (146,) T. A. Jebb 137,081
Ticket, duplex railroad, (146,) T. A. Jebb 137,208
Tickets, book of railroad fare, (146,) Jebb and Brush 137,209
Tobacco, flavoring, coating, and putting up, (160,) J. Kerr 137,084
Tobacco, machine for shearing and booking, (160,) Bisbing and McCune 137,170
Toe nails, clasp for preventing ingrowing of, (156,) E. E. Stedman 137,106
Torpedo for oil wells, (124,) A. Hamar 137,198
Torpedo, self tamping, (124,) M. Gotham 137,196
Toy, (143,) W. R. Withers 137,119
Toy gun, (143,) A. James 137,080
Trap, insect, (63,) J. McN. Smith 137,255
Traps, core for casting stench, (33,) M. Gafney 137,133
Treadle, (67,) J. H. Osborn 137,020
Truck, hand, (31,) H. S. La Tourette 137,086
Tubes, apparatus for brazing metal, (136,) Gorman and Peregoy 137,068
Umbrella handle, (165,) A. Oberndorf, Jr 137,233
Umbrella runners, machine for cutting nicks in, (165,) O. M. Smith 137,256
Urinal for medical purposes, bed, (8,) Knight and Coburn 137,214
Valve and variable cut off, rotary, (152,) R. T. P. Allen .. 137,163
Vehicle wheel, (31,) P. Jones 137,083
Wagon loader, (79,) J. Johnson 137,138
Washing machine, (91,) J. Ballard 137,046
Washing machine, (91,) H. H. Case 137,177
Washing machine, (91,) F. Hulet 137,206
Washing machine, (91,) J. H. Kruse 137,218
Washing machine, (91,) A. O'Dell 137,234
Washing machine, (91,) G. Seymour 137,151
Washing machine, (91,) B. A. Williams 137,161
Water closet, (8,) J. G. Jennings 137,082
Water wheel, (168,) J. Nolan 137,146
Water wheel, (168,) B. Ruof 137,242
Water wheel, (168,) J. E. Stevenson, (reissue) 5,341
Water cut off, rain, (126,) J. W. Wetmore 137,268
Whiffletree attachment for vehicles, (31,) A. Soursin 137,103
Windmill, (118,) G. A. Swartz 137,111
Window shades, tassel clip for, (62,) F. Muller, (reissue). 5,338
Wrench and grappling tool, combined, (100,) S. B. Dexter. 137,129
Wrench heads, die for forming, (100,) L. Chapman 137,052
Wrench heads, die for forming, (100,) L. Chapman 137,053

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 25, 1873.

Adair, I. V., Post driver 137,120
Alcorn, W. H., Child's swing 137,121
Allen, R. T. P., Rotary valve and variable cut off 137,163
Allison, O. W., and P. Homelius, Apparatus for cleaning horses 137,045
American Duplex Ticket Company, assignee 137,209
Anderson, J. S., Propelling boats 137,164
Andrews, E., assignee, (reissue) 5,339
Andrews, W. D., Hoisting machine safety attachment ... 137,165
Andrews, W. H., Reversible knob latch 137,166
Anthony, Seaver, and Southworth 137,245
Attix, T. F., assignee 137,127
Baker, A. E., Reciprocating steam engine 137,167
Ballard, J., Washing machine 137,046
Barnum, D. and E. B., Sewing machine tucker 137,047
Bartle, W. S., and J. Garlock, Feed cutter 137,168
Barton, R. T., Brick machine 137,132
Bary, A. B., Bobbin winder for sewing machines 137,048
Baylie, Harbin, and Foster 137,192
Beach, T., Air pump and engine 137,123
Beaver, P. H., Collar pad 137,049
Bennett, J. G., assignee 137,184
Berryman and Wakefield 137,266
Billings, G. W., Railroad switch 137,050
Billings, G. W., assignee 137,085
Birch, W., Machine for opening, smoothing, and guiding fabrics 137,169
Bisbing, I. W., and J. S. McCune, Machine for shearing and booking tobacco 137,170
Blanchard, E., Combined garden hoe and roller 137,124
Bloch, B. A., Hydraulic motor 137,171
Blythe, G., Saw filing machine 137,172
Bobrownicki and Christy 137,059
Bolton, O., Jr., Cupola and other metallurgic furnaces ... 137,125
Breed, A., Clack valve for wooden pumps 137,126
Brenner, F., Apparatus for pitching casks 137,173
Brigham, C. P., assignee, (reissue) 5,336
Brodie, G., Cotton bale tie, (reissue) 5,333
Brown, C. H., and J. J. Thomas, Apparatus for exhausting and washing gas 137,174
Brush and Jebb 137,209
Brusie, R., Portable fountain and lawn sprinkler 137,175
Burrows and Stillman 137,257
Buzzell, J. G., & Co., assignees 137,187
Cable, W., Thill coupling 137,176
Caine, D., Seeding machine 137,051
Carson, T., Marbleized composition stone 137,127
Case, H. H., Washing machine 137,177
Chapman, L., Die for forming wrench heads 137,052
Chapman, L., Die for forming wrench heads 137,053
Chapman, L., Rotary pump 137,054
Chapman, L., Rotary pump 137,055
Chapman, L., Rotary engine or pump 137,056
Chapman, L., Rotary pump 137,057
Chapman, L., Rotary pump 137,058
Christy, T., Jr., and A. Bobrownicki, Treating sewage and ammoniacal waters for production of fertilizers, &c.. 137,059
Clark, H. A., Spring butt hinge 137,178
Clark, T. J. and G. M., Plow 137,060
Clough, C. F., and J. B. Lincoln, Treadle for sewing machines 137,179
Coburn and Knight 137,214
Collins Company, assignee 137,052, 137,053
Connable, R., Kiln 137,180
Cooley, W. T., assignee 137,148
Cooper, E. A., Indicator lock 137,181
Corliss, W., Burglar proof safe 137,061
Cornell, T. L., assignee 137,075

Coyle and Gallagher 137,066
Croghan, J., Combined chair, table, and lounge 137,062
Cropper, T. E., Measuring funnel 137,182
Cummings, P. D., Machine for skiving and splitting leather 137,183
Cuthbert, J. C., assignee 137,170
Davies, H. J., Machine for printing and embossing skirts 137,184
Decker, L. H., Fanning mill 137,185
De Forest, T. B., and T. S. Gilbert, Hoop skirt, (reissue). 5,334
Delkescamp, A., Die for cutting out ornamental forms of paper 137,063
De Mott, I., Horseshoe 137,128
Dexter, S. B., Combined wrench and grappling tool 137,129
Dexter, S. B., Grappler 137,130
Dies, F. A. J., assignee 137,064
Dobson, J. and J., assignees 137,252
Downs, W. E., assignee 137,075
Drake, E., Combined percussion and time fuse for shells. 137,186
Dunham, G. B., Buffing mandrel 137,187
Dunton, D., Temporary binder 137,131
Eames, C. J., Combustion chamber for burning hydrocarbon vapors 137,132
Estes, S., Loom take up mechanism 137,188
Faucher, C. H., Forming and gaging butter rolls 137,064
Fay, W., Automatic fan 137,189
Fisher, J. S., Wheel for road steamers 137,065
Fleetwood, T. M., Combined sail and marine drag 137,190
Ford, F. G., Bedstead 137,191
Foster, R. F., T. S. Baylie, and J. Harbin, Machine for rounding and backing books 137,192
Frear, G. A., Expelling air from composition from which artificial stone is molded 137,193
Gafney, M., Core for casting stench traps 137,133
Gallagher, B., and J. Coyle, Sole trimming machine 137,066
Gardner, H. W., assignee 137,167
Garlock and Bartle 137,168
Gearhart, C. H., Car coupling 137,067
Geemen, J., Kiln for drying malt, &c 137,194
Gee, W., Dispensing apparatus for soda water 137,195
Gibbs, J., Locomotive spark arrester 137,134
Gilbert and De Forest, (reissue) 5,334
Gorham Manufacturing Company, assignee 137,248
Gorman, T. G., and N. W. Peregoy, Apparatus for brazing metal tubes 137,068
Goss, G. D., Reclining chair 137,069
Gotham, M., Self-tamping torpedo 137,196
Gowenlock, W., Steam lubricator 137,070
Greene, G. S., Jr., Cartridge capping and uncapping device 137,071
Griffing, C. S. S., Carriage spring 137,197
Gutzkow, F., Manufacture of boracic acid 137,072
Harbin, Foster, and Baylie 137,192
Halvorsen, T., Sharpening scissors 137,135
Hamar, A., Torpedo for oil wells 137,198
Hamilton, W., Steam lubricator 137,073
Happe, J., and W. Newman, Sewing machine for quilting 137,199
Hard, J. A., Meat chopper 137,074
Harrington, I., Apparatus for teaching mensuration 137,075
Haskins, J. F., Vapor engine 137,200
Hawkins, J. T., Machine for making spool blanks 137,136
Hawkins, L. D., assignee 137,267
Hendy, J., Double friction coupling, (reissue) 5,335

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

PATENT OFFICE REPORTS—1790 TO 1836.

The Patent Office Reports for the forty-seven years from 1790 to 1836, inclusive, have been reproduced in fac-simile by photolithography, forming an octavo volume of 806 pages, which is offered at $8 per copy, full bound in calf.

The edition for sale is limited to 200 copies, and application should be made soon. If ordered before the 1st of July next, the volumes can be sent to subscribers under the Commissioner's frank.

Address

COMMISSIONER OF PATENTS,
Washington, D. C.

COMMISSIONER'S DECISIONS.

W. W. GOODWIN.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of W. W. Goodwin for letters patent for* IMPROVEMENT IN PHOTOMETERS.—*Decided April* 1, 1873.]

To place upon a photometer two scales beside each other upon a single plate, one indicating the pressure of the gas, the other the degree of light, so that they can be readily compared, involves so much novelty that the originator of the device should have his right to it sanctioned.

To denominate such scales indexes in the specification and claim is incorrect, and justifies a rejection of the application.

LEGGETT, *Commissioner:*

Applicant proposes to combine, in an ordinary photometer having a pressure scale and index, a scale for exhibiting the number of candles to which the gas is equivalent. He constructs a plate with these two scales formed upon it, and thus dispenses with the use of the separate diagram of Kirkham and Sugg, and enables the inspector, by a single glance at the apparatus, to determine both the pressure and the light power of the gas. It is true, as stated by the Board, that he has not "ascertained the several degrees of pressure required in order to produce a seven-inch flame from a given aperture for gas of various qualities." All that has been done by others. He has simply produced a device in which is combined two scales adapted relatively to each other, so that the pressure-index shall also serve to indicate the light power, which device seems to be a novel and useful mechanical production, and, if not met by a reference, should receive favorable consideration.

The scales are termed "indexes" in the specification and claim—a misnomer, which, perhaps, has led to the misunderstanding of the case. As the case now stands the decision of the Board must be affirmed.

If, however, the application is amended in compliance with the above suggestion, and a claim is substituted covering the combination of the two scales and the index as shown in the drawings, I see no reason why a patent should not be granted.

SMITH *vs.* HOPKINS.—*Interference.*

[*Appeal from the decision of the Examiners-in-Chief in the matter of the interference between the applications of O. A. Smith and D. A. Hopkins for patent for an* ATTACHMENT FOR CAR-AXLE BOXES.—*Decided April* 1, 1873.

LEGGETT, *Commissioner:*

This interference arises respecting an invention designed to prevent the entrance of dust into the journal-boxes of railroad-cars. It consists of a sleeve inserted in a circular groove in the hub of a wheel, and having a flange or diaphragm which enters an annular recess on the end of the journal-box. The parties are both from the same place, and occupied the same office. Smith was superintendent of car repairs, and Hopkins

a manufacturer of railway machinery. They employed draftsmen who worked at the same desk, and their drawings were open to mutual inspection. Hopkins had drawings of the invention made early in 1870, and Smith not till early in 1871. The parties were on good terms, and Smith admits that he saw drawings of axle-boxes on the table of Hopkins's draftsmen in 1870, although he denies that he thereby obtained any suggestion of this invention. Under the circumstances the doubt suggested by the Board whether Smith is an independent inventor would be natural. As soon as Hopkins became aware that Smith was engaged with the invention he made claim to it. He also pointed out defects in Smith's device which experiment proved to exist. He at no time relinquished his invention, nor does it appear that he neglected it. He had patterns and castings made at different times. He observed the experiments of Smith for his own advantage, but not without warning him that he claimed the invention as his own. Without unreasonable delay he made application for patent preceding Smith's application. He has gone one step further than Smith. He accommodates the "tip" of the box by forming his groove in the hub wider than the thickness of the sleeve and interposing a leather packing.

Admitting that Smith was an original inventor, which I am inclined to believe, both parties were seeking to adopt and perfect the invention preparatory to making application for a patent. Hopkins began first, has gone furthest in his contrivance, and was first to ask for a patent. Upon the proofs he is clearly the first inventor. There is no advantage in a practical application of an invention after its completion by a party to an interference unless it appears that the other party has been unreasonably negligent in perfecting and laying claim to the invention. To be sure such an application to use is a demonstration of the practicability of the device, but it is not otherwise meritorious or important in a controversy of this kind, where the utility of the invention is not likely to be a point of dispute.

The decision of the Board awarding priority to Hopkins is affirmed.

RICE *vs.* WINCHESTER.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of Aaron Rice and George C. Winchester for a patent for a* TILTING CHAIR.—*Decided April* 3, 1873.]

He is the prior inventor and is entitled to the patent for an invention who first embodies it in a complete, practical, working utensil, and exhibits it in public, though another afterward reduces it to practice and applies for a patent before him.

After such an embodiment of his invention his delay in applying for a patent can operate only as an abandonment to the public; it is not forfeited thereby in favor of a subsequent inventor.

Although an invention is embodied in a complete working article, and used so far as to demonstrate its practicability and establish the inventor's right to a patent, yet he will not lose his right by delaying for nearly two years to file an application.

LEGGETT, *Commissioner:*

The invention in controversy is a torsional spring for tilting or oscillating chairs, combined with the hinges which connect the stool and the tilting seat. Two straight steel springs extend under the seat obliquely from the upper portion of one hinge to the lower portion of the other, crossing each other and being secured to the respective parts of the hinges at their opposite ends. The facts in proof appear to be substantially agreed upon by the Examiner of Interferences and the Board, but they have come to opposite conclusions as to which of the parties should be held, in contemplation of law, to be the prior inventor. This has arisen not from any conflicting view of the law, but from a difference of opinion as to what is proven by the testimony in the case.

It has been laid down by the courts in numerous cases, too often cited to require specific reference here, that where one has conceived but not perfected an invention, an independent inventor may have a valid patent who has subsequently conceived, perfected, and introduced the invention, unless in the meantime the party first to conceive it was using reasonable diligence in adopting and perfecting it. In this case it is clear that Winchester was first to conceive the invention, but the tribunals named differ as to whether he had completed it, or was using reasonable diligence to do so. If Winchester had completed and embodied his invention in practicable form, in which it could unmistakably be communicated to the public, and it was new, then no obstacle but abandonment in fact, or its use in public for more than two years, could deprive him of his right to a patent for it under the statute. But if he had not done this, then, unless he used reasonable diligence in adopting and perfecting it, he might be forestalled by a patent to an independent inventor more diligent than himself. Such is the rule which does and must govern this Office in cases of this nature; and it is reiterated here only because an elaborate argument is introduced in the case which shows that the rule is not well understood. Any other rule will involve the absurdity of granting patents which it is known in advance will not be sustained in the courts.

The proof shows that Winchester conceived the invention in the early part of 1870, and immediately had one or two chairs constructed embodying the invention, and that these chairs were exhibited in Winchester's office, where they remained for a long time. Rice conceived the invention in October, 1871. He also made two chairs embodying the invention, and applied for a patent December 13, 1871. Winchester filed his application December 29, 1871, sixteen days later. In view of these facts the Examiner of Interferences awarded priority in favor of Winchester.

The testimony, however, shows that the torsional springs in Winchester's chairs were made of wire too light to furnish the requisite stiffness, and the Board seize upon this fact and condemn his invention as an abandoned experiment and award priority to Rice.

The proof shows clearly that Winchester's chairs were constructed upon substantially the same plan and principle as Rice's, the only difference being that Rice made the better chairs, because he used wire of larger gage. Winchester used such wire as he had on hand at the time, and noticed and remarked that it was too light. The invention, then, was just as complete in the hands of Winchester in the spring of 1870 as it was in the hands of Rice in the fall of 1871. Winchester completed it and exhibited it in public early in 1870, nearly two years before Rice invented it. If Winchester abandoned his invention after having completed it he abandoned it to the public—not to Rice; but there is no evidence of abandonment. He explains in his testimony why he delayed in applying for a patent earlier, and why he did not proceed to manufacture the chairs.

I am fully satisfied that Winchester completed his invention in the spring of 1870, by reducing it to practice, and must, therefore, reverse the decision of the Board and decide priority in favor of Winchester.

A. B. LATTA, BY ADMINISTRATOR.—*Extension.*

[*In the matter of the application of Finley Latta, administrator of A. B. Latta, for the extension of letters patent No.* 23,589, *for* IMPROVEMENT IN STEAM-GENERATORS, *granted April* 12, 1859.—*Decided April* 2, 1873.]

A patent for an invention which is described and shown in a previous patent to the same grantee will not be extended.

An application for an extension refused because the sworn statement and testimony were highly defective, and failed to furnish the information required, they consisting mostly of copies of what was filed upon a former application for the extension of another patent.

THACHER, *Acting Commissioner:*

The presentation of this case is so defective that an extension could not be granted even if the application appeared to possess merit. A copy of the "sworn statement" in a prior application for extension has been filed in this case with the supposition that it related to this patent also for the period covered thereby. Upon examination, however, it is found that no allusion whatever is made to the patent, the extension of which is now sought, so that the "sworn statement" required by official rules in applications for extension is entirely wanting, with the exception of a brief and supplementary affidavit covering the period intervening since the date of the former application in 1871. Most of the testimony submitted in this case is of the same character. There are but two affidavits relating in any way to the patent of April 12, 1859. The others are certified copies of affidavits filed in the application for an extension of a patent granted in 1857, and are deficient in the same particular as the copy of the statement in the same case. The patent now under consideration with exceptions noted is not included in the statement and testimony, and the petition is, consequently, left almost entirely without support. I also find that this patent could not be extended, even if the case were properly presented. The invention here claimed is a special device for regulating the circulation of water through division-coils. This identical device is found to have been described and illustrated in a prior patent granted to Latta October 20, 1857. It was also indirectly claimed in this prior application, but on reference cited the claim was stricken out, but without any objection on the part of the Office that it was not proper subject-matter to be included in that application. This fact seems to have been overlooked when the 1859 patent was granted. It appears that the latter patent, the extension of which is now sought, was improperly granted. The device should have been obtained by reissue of the 1857 patent, and not in a new application. The objection to the extension of patents like this has been stated in decisions heretofore. (L. M. Singer, C. D., 1870, p. 146.) It would be virtually continuing the protection afforded by letters patent for a longer term than the law contemplated, in this case amounting to a difference between October 20, 1857, and April 12, 1859, or about two years. What rights applicant may have under the patent of October 20, 1857, which has been extended, it is not necessary to discuss here; but the state of facts developed in the examination of this case is fatal to the grant of the extension sought.

The prayer of the petitioner must therefore be refused.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

THE RUMFORD CHEMICAL WORKS *vs.* JOHN E. LAUER.

SAME *vs.* JOHN HECKER *et al.*

[*In Equity.—Before Blatchford, J.—September* 13, 1872.]

The first and second claims of the reissued letters patent granted to the Rumford Chemical Works, June 9, 1868, as assignees of Eben N. Horsford, as inventor, for an "improvement in pulverulent acid for use in the preparation of soda powders, farinaceous food, and other purposes," the original patent having been granted to Horsford April 22, 1856, and reissued to the plaintiffs May 7, 1867, and again reissued to them June 9, 1868, namely, (1) "As a new manufacture, the above-described pulverulent phosphoric acid; (2) The manufacture of the above-described pulverulent phosphoric acid, so that it may be applied in the manner and for the purposes described," are void for want of novelty, regarding the second claim as one to the described process of making the acid claimed in the first claim as a new manufacture.

Two chemical processes held to be the same, although the proportions of the ingredients used in the two were not the same.

The products of the two processes held to be the same.

The 9th section of the act of March 3, 1837, (5 U. S. Stat. at Large, 194,) is designed to allow a patentee to recover on one claim of his patent, notwithstanding other claims in it are void for want of novelty, but it requires that the parts claimed without right and the parts rightfully claimed shall be definitely distinguished from each other in the claims.

The third claim of the said patent, namely, (3) "The mixing, in the preparation of farinaceous food, with flour, of a powder or powders, such as described, consisting of ingredients of which phosphoric acid, or acid phosphates, and alkaline carbonates are the active agents, for the purpose of liberating carbonic acid, as described, when subjected to moisture or heat, or both," is a claim to the mixing of the acid and alkali with the flour in a dry state, and stopping at that point, without applying moisture or heat.

Such claim is void, in view of the letters patent granted by the United States, May 1, 1849, to John Fowler, which describe a mixture consisting of flour and dry powdered tartaric acid and a dry powdered alkaline carbonate, requiring only the addition of water to make dough.

The substitution of phosphoric acid, or acid phosphate, in the mixture referred to in such claim, in place of the acid named in Fowler's patent, was a mere formal and colorable alteration of Fowler's mixture, and not an invention and not the subject of a patent.

The fourth claim of the said patent, namely, (4) "The use of phosphoric acid or acid phosphates, when employed with alkaline carbonates, as a substitute for ferment or leaven in the preparation of farinaceous food," is a claim to the actual use of such acid and alkali in making raised dough, and is valid.

It required experiment and invention to find out whether phosphoric acid could be used in place of tartaric acid practically and successfully, and with safety to health.

Proper form of decree on the infringement of the fourth claim.

Motion to amend a bill of complaint denied.

Motion to open proofs and for a rehearing granted.

The suit of the *Rumford Chemical Works* vs. *John E. Lauer* was a suit in equity, brought by the Rumford

Chemical Works, a Rhode Island corporation, founded on reissued letters patent granted to the plaintiffs June 9, 1868, for an "improvement in pulverulent acid for use in the preparation of soda powders, farinaceous food, and for other purposes," as assignees of the alleged inventor, Eben N. Horsford. The original patent was granted to Horsford April 22, 1856, and was reissued to the plaintiffs May 7, 1867, and reissued to them a second time June 9, 1868. The infringement alleged in the bill was the making and selling by the defendant of pulverulent acid, in infringement of said reissued patent of 1868. The defendant, in his answer, admitted that he had made and sold improved acid compound for use in baking and cooking, under letters patent granted to him February 19, 1867.

The specification of the plaintiffs' patent stated the invention to be a "new pulverulent acid for use in the preparation of soda powders, farinaceous food, and for other purposes." It then described the acid and the mode of its preparation. It said:

> Carefully-washed and properly-burned bones, after being ground, are put into freshly-diluted oil of vitriol, with continual stirring and in the following proportions: Five hundred pounds of the above-described bones, (sometimes called bone-ash,) four hundred pounds of oil of vitriol, and one thousand pounds of water. These ingredients are stirred from time to time for about three days, when, ordinarily, the action will be completed, and the resultant products will be phosphoric acid, superphosphates, and sulphate of lime, or gypsum, with a small proportion of salts of magnesia and soda, in a paste-like mass.

Various methods were then described for making this mass pulverulent: 1st. Mixing it while moist with any farinaceous substance, drying it slowly in the sun, or with artificial heat not above 150° of Fahrenheit, and pulverizing it. 2d. Mixing it with freshly-burned gypsum, drying it in the sun or by artificial heat, and pulverizing it. 3d. Mixing it with stearine or other fatty bodies, drying it, and pulverizing it. 4th. Leaching the mass, mixing the concentrated extracts with burned gypsum or stearine, drying it, and pulverizing it. 5th. Drying and pulverizing it without admixture. All of these modes were stated to have given desirable results, but a preferable mode was then described, which consists in leaching the mass, concentrating the mass to 25° Baumé, thereby obtaining a solution consisting of phosphoric acid and acid phosphate of lime, with slight traces of other salts, substantially freed from gypsum or sulphate of lime, heating ten gallons of this mixture to boiling, adding four pounds of perfectly-white bone-ash, continuing the boiling until the concentrated liquid mass, containing in solution the added bone-ash, became pasty, cooling the mass, adding seventy-six pounds of wheaten flour mixed to a uniform paste, adding sixteen pounds of potato-starch carefully mixed, sifting it through a sieve with quarter-inch meshes, drying it thoroughly at a temperature of not over 150° Fahrenheit, and pulverizing it. The sole object of these manipulations of the paste-like mass was to obtain it in the shape of powder. The specification said:

> The object is to obtain phosphoric acid in such form—that is, a pulverulent powder—so that it may be intimately mixed with any alkaline carbonates, or other sensitive chemical compounds, without decomposing them or entering into combination with them, except upon the addition of moisture or the application of artificial heat. This requires that the phosphoric acid or acid phosphates be mixed with some neutral agent, as flour or starch, gypsum, &c., so that action of the acid shall be prevented while dry, and shall, when moisture or heat is applied, be prompt, thorough, and equally diffused. * * * As a dry, brittle powder the article has the advantages of a pulverulent acid, may be handled, weighed, stirred, &c., as tartaric acid or cream tartar, and as a substitute for these and a variety of pulverulent acids and acid salts it has many uses in manufacture. It may, among other uses, be mixed with dry alkaline carbonates, (carbonate of potassa or carbonate of soda,) and remain in this state, without evolution of carbonic acid, until moistened or heated, thus making it a substitute for cream tartar and tartaric acid in the preparation of yeast-powder or baking-powder. I am aware that acid phosphates have been used as fertilizers; but because of the method pursued in their manufacture, their coarseness, dark color, and offensive impurities, they were totally unfit to be used in the preparation of food. I am also aware that acid phosphates and phosphoric acid, in a liquid or more or less viscid condition, have been prepared in the laboratory of the chemist; but neither of these forms of phosphoric acid or acid phosphates possessed the properties essential to the purpose for which I design to employ them. The body which I have invented and above described is a form of acid phosphate of lime, or of mixed acid phosphate of lime and phosphoric acid, in which the phosphoric acid is the active and valuable constituent, free from the objectionable qualities of the above mentioned bodies. It is a dry, fine, white, or nearly white, homogeneous powder, unobjectionable on account of odor, taste, or composition, is an essential and important element in healthful nutrition, and is suited to be employed as the acid ingredient in the preparation of self-raising farinaceous food. In order to make the article possessing these qualities and suitable to this office, it is necessary that a powder should be made which can be not only evenly comminuted and diluted, but one which shall have so little affinity for the moisture of the atmosphere that it can be mixed with flour and bicarbonate of soda in the practical preparation of self-raising flour. * * * To meet the wants I have contemplated, the phosphoric acid must be a dry, fine, homogeneous powder, white, or nearly white, and unobjectionable on account of smell, or taste, or healthfulness. It must be a dry powder, to permit it to be mixed with flour and bicarbonate of soda and not evolve carbonic acid prematurely. If sticky it would mix unequally, and if moist it would at once act on the bicarbonate of soda to decompose it and set free carbonic acid. It must be a fine powder, in order, so to speak, that, with proper distribution, each minute quantity of flour may be brought into juxtaposition with a particle of acid and a particle of bicarbonate of soda, so that upon the application of moisture the carbonic acid of the bicarbonate of soda shall be so uniformly liberated throughout the entire mass of the dough that it shall secure a uniform finely porous structure throughout the loaf. It must be a homogeneous powder—that is, all particles must have a like acidity—in order that the decomposition of the alkaline carbonates shall be uniform, and thus prevent portions of the bread from becoming dark-colored, heavy, and alkaline by the action of undecomposed bicarbonate, while certain other portions may become sour on account of uncombined acid. * * * The acidified mixture above described as acid phosphate, or acid phosphate and free phosphoric acid, I have called "pulverulent phosphoric acid." The acid agent which this preparation places in available condition is phosphoric acid, as tartaric acid is the available acid agent in cream tartar, and this is used as a substitute for tartaric acid or cream tartar to decompose alkaline carbonates, as stated above, in the well-known process of making bread, cake, &c., without the use of ferment.

The claims of the patent were as follows:

1. I claim, as a new manufacture, the above-described pulverulent phosphoric acid.
2. I claim the manufacture of the above-described pulverulent phosphoric acid, so that it may be applied in the manner and for the purposes described.
3. I claim the mixing, in the preparation of farinaceous food, with flour, of a powder or powders, such as described, consisting of ingredients of which phosphoric acid or acid phosphates and alkaline carbonates are the active agents, for the purpose of liberating carbonic acid, as described, when subjected to moisture or heat, or both.
4. The use of phosphoric acid or acid phosphates, when employed with alkaline carbonates, as a substitute for ferment or leaven in the preparation of farinaceous food.

The case was brought to final hearing on pleadings and proofs, and the court (BLATCHFORD, J.) held that, as the alleged infringement charged in the bill was confined to the making and selling of pulverulent acid in infringement of the patent, only the first two claims of the patent were involved; that the first claim was a claim to the described pulverulent phosphoric acid as a new article of manufacture; and that, whether the second claim was to be regarded as a claim to the process of making such acid, or as being, in substance, the same as the first claim, in another form, it was unnecessary to determine in the view taken of the case by the court.

The defenses set up were that Horsford was not the original and first inventor of anything which had been made and sold by the defendant, and that the defendant had not infringed the patent. On the question of novelty, the defendant undertook to establish that Horsford was not the original and first inventor of a pulverulent acid phosphate of lime suitable to be used with bicarbonate of soda, as a substitute for ferment or leaven, in the preparation of farinaceous food; and that an acid phosphate possessing all the properties and qualities of the acid phosphate described in the plaintiffs' patent was known in the arts prior to the date of Horsford's invention. The article relied on by the defendant as antedating Horsford's acid was what was known as the three-fourths phosphate of Berzelius, described in the Hand-Book of Chemistry by Leopold Gmelin, volume 3, page 195, published in 1846. It was claimed by the defendant that this three-fourths phosphate was an acid phosphate of lime, possessing all the properties and qualities specified in the plaintiffs' patent as being possessed by Horsford's pulverulent phosphoric acid, and as being necessary, in admixture with bicarbonate of soda, for the preparation of self-raising farinaceous bread; that it was a dry, non-hygroscopic, fine, white, homogeneous powder, unobjectionable on account of odor, taste, or composition; that the phosphoric acid of such powder was the active agent, when the powder was mixed with bicarbonate of soda and moistened, in liberating carbonic-acid gas to give porosity to dough; and that such acid, in uniting with the soda of the carbonate to evolve carbonic-acid gas, formed phosphate of soda, which was deposited in the dough. The three-fourths phosphate was so called as having a chemical composition of four atoms of oxide of lime and three atoms of phosphoric acid. The entire passage in Gmelin describing this phosphate was as follows:

> 4 Ca O, 3 PO^5 c. *Three-fourths Phosphate.* Aqueous solution of phosphoric acid is saturated with the salt *a*, the solution mixed with alcohol, and the white precipitate formed washed with alcohol and dried. White powder, having an acid taste and reddening litmus. With water it separates into the insoluble salt *b* and an acid salt, which remains in solution, (with one atom of acid?) (Berzelius *Ann. Chim. Phys.*, 2, 167.) If the salt *a*, recently precipitated, is immersed in a solution of hydrated phosphoric acid ignited just before it was dissolved in water, it gradually changes to a tenacious acid mass, which may be drawn out into threads and sticks to the teeth; after drying, it becomes yellow, transparent, and very friable. This substance has the same composition as *c*, and is decomposed in the same manner by water, but contains metaphosphoric acid as well as ordinary phosphoric acid. (Berzelius', *Lehrb.*, 4, 277.) Graham regards this compound as metaphosphate of lime.

The court held that the first claim of the plaintiffs' patent, if valid, would be infringed by the manufacture, sale, or use of any dry, fine, homogeneous powder containing, as an active agent, phosphoric acid in an available condition to be used as a substitute for tartaric acid, in decomposing an alkaline carbonate, in making bread without the use of ferment; that the prior existence of any such powder was an answer to such first claim; that the testimony showed that, by following the description in Gmelin, a dry, fine, homogeneous powder was produced, containing, as an active agent, phosphoric acid, in an available condition to be used as a substitute for other acid in decomposing an alkaline carbonate, in making bread without the use of ferment, and which was used for that purpose successfully, and which powder did not, by being kept, lose its acid strength or become inert, or absorb moisture from the air, or part with any of the qualities defined in the plaintiffs' patent as necessary in such a powder; that the pulverulent phosphoric acid, as a chemical substance, claimed in the first claim of the plaintiffs' patent, was shown by the evidence to have existed prior to the invention of it by Horsford; and that the first claim was therefore void for want of novelty.

The court held, as to the second claim, that if it were regarded as a claim to the process described in the patent for making the acid, the defendant had not infringed it, because his process was as different from that of the plaintiffs as the plaintiffs' was different from that described by Berzelius or Gmelin; that the defendant dissolved bone-black in a mixture of muriatic acid and water, filtered the product, added sulphuric acid, and dried the resultant mass by heat till it crumbled into a powder which was white and acid, and could be used, in connection with bicarbonate of soda, to liberate carbonic acid, to make bread; that bone-black was burned bones; that the muriatic acid dissolved the phosphate of lime in the bones from the carbon, the filtering got rid of the carbon, the action of the sulphuric acid created sulphate of lime, acid-phosphate of lime, and free phosphoric acid, and the heat drove off the muriatic acid; that Horsford removed the carbon from the bones by fire before he applied the sulphuric acid, while the defendant removed the carbon from the bones by muriatic acid, and then got rid of that acid by heat; that Horsford burned away the carbon from the phosphate of lime in the bones, while the defendant dissolved away the phosphate of lime from the carbon; that the products produced by the two processes were substantially identical with each other and with the product produced by the process of Berzelius and Gmelin, as powders containing phosphoric acid as an available agent to decompose alkaline carbonates, for the purpose of liberating carbonic acid, to give porosity to dough, but the three processes differed each from the other, in substance; that it appeared from the evidence that the use of sulphuric acid to act on what was indifferently known as bone-earth, or bone-ash, or bone-phosphate, being common bones containing phosphate of lime, and thus form sulphate of lime and liberate phosphoric acid, or an acid phosphate of lime, was well known before the date of the alleged invention of Horsford; that the defendant did not, by the use of the process described in his patent, infringe the second claim of the plaintiffs' patent, considered as a claim to the process described in that patent for making the pulverulent acid therein described; and that, if the second claim were considered as a claim to the acid as a product, the conclusions arrived at in regard to the first claim applied to it.

The third and fourth claims of the plaintiffs' patent not being involved in the case, the court remarked that the questions so largely discussed by the counsel for the plaintiffs, on the argument, as to whether Horsford was not the first person who used, as a substitute for yeast, a powder containing phosphoric acid as its active agent, and as to whether he is not entitled to a patent for applying phosphoric acid, in connection with an alkaline carbonate, to the raising of dough, and as to whether the third and fourth claims of the plaintiffs' patent were not valid, as containing inventions which involved the necessity of experiments to determine whether phosphoric acid, when artificially introduced into bread, would be healthful, and whether and how the acid could be mixed with flour and with an alkaline carbonate, and remain inactive until moistened or heated, were questions which would arise on the patent when a suit was brought on it for the infringement of its third and fourth claims, but they were not pre-

sented in this case; and that it might be that there were claims which Horsford could make and hold in reference to certain constituents and qualities of the pulverulent phosphoric acid that was made by his process, but the broad claim made to the acid described was not tenable.

The conclusion was that the bill must be dismissed.

Before a decree was signed or entered on such decision the plaintiffs moved to amend the bill by adding to the averment that the defendant had made and sold pulverulent acid in infringement of the patent—an averment that he had used such acid. The motion was made on the ground that, as the answer of the defendant admitted that the defendant had made, used, and sold improved acid compound for use in baking and cooking, under letters patent granted to him February 19, 1867, such averment of user would, in connection with such admission, raise an issue as to the infringement of the third and fourth claims of the patent. It was shown, however, by affidavit, on the part of the defendant, that he had never used any acid phosphate with an alkaline carbonate, except in a few instances for the purpose of experiment, and had never mixed any acid phosphate with an alkaline carbonate for sale, to be used in the preparation of farinaceous food or for any other purpose; and it did not appear that the defendant had used the plaintiffs' acid otherwise than by making and selling the acid compound patented to the defendant. The court, therefore, held that the defendant had not infringed the third and fourth claims of the patent; that the issues as to the first and second claims were raised by the averments in the bill as to making and selling the acid as fully as if the averment in regard to using it were contained in the bill; and that the motion to amend the bill must be denied.

At the same time a motion was made, on the part of the plaintiffs, to open the proofs in the case for further testimony and for a reargument. The ground of the motion was that two of the chemical experts for the plaintiffs did not, in preparing specimens which they produced as specimens of the three-fourths phosphate of Berzelius, follow the process of manufacture described in the public works referred to, in that such specimens differed in chemical composition from such three-fourths phosphate, and that they boiled the solutions they employed. It was also urged that a three-fourths phosphate fulfilling the formula of Berzelius could be produced without the use of heat, and had been so produced by the plaintiffs' expert, and was, when so produced, practically inert and useless as a constituent of a baking-powder. The court held that that branch of the case had not been fully developed in the testimony taken for the hearing; that the question as to the effect of using heat in the process had not been gone into to the extent which seemed desirable; that the question as to whether the substance produced as the three-fourths phosphate was made by the process of Berzelius was a vital question in the case; and that both parties ought to be allowed to take further testimony as to the novelty of what was covered by the first and second claims of the plaintiffs' patent, as affected by the descriptions in the public works referred to, the case to be then heard on the testimony already taken and on the new proofs to be taken.

The case now came on to be reheard.

[*William Whiting* and *Clarence A. Seward*, for the plaintiffs. *Charles M. Keller*, for the defendant.]

BLATCHFORD, *J.*:

Although the announced decision of the court on the motion of the plaintiffs for a reargument was that both parties would be allowed to take further testimony as to the novelty of what is covered by the first and second claims of the plaintiffs' patent, as affected by the description of the three-fourths phosphate in the Lehrbuch and in Gmelin, yet the formal order entered was an unrestricted one, reopening the cause, with liberty to either party to take further proofs, and to bring on the cause for a rehearing on the proofs then already taken and such further proofs as might be taken. A large mass of further testimony has been taken on all the points involved in the cause, and it has been reargued.

The first two claims of the patent are the only ones involved in this suit. As to them the contest is as to their novelty. Regarding the second claim as a claim to the described process of making the acid claimed in the first claim as a new manufacture, the process so described consists, so far as substance is concerned, in mixing together five hundred pounds of bone-ash, (made by grinding burned bones,) and four hundred pounds of freshly-diluted oil of vitriol, (which is sulphuric acid,) and one thousand pounds of water, stirring the ingredients from time to time for about three days, and drying and pulverizing the resultant mass. The resulting pulverized powder is claimed in the first claim as a new manufacture. It is said, in the specification, to consist of phosphoric acid, superphosphates, and sulphate of lime or gypsum, with a small proportion of salts of magnesia and soda.

The process of the plaintiffs' specification is fully anticipated by the description of Lawes' process of making a dry superphosphate, which was not before the court on a former hearing. The Lawes process was published in England in 1845, in an article in volume 5 of the Journal of the Royal Agricultural Society of England, entitled "On the action and application of dissolved bones." The article says: "Where calcined bones are used, owing to their containing merely the earthy portions of the bones, and to their being so easily dissolved, a dry superphosphate may be formed." For effecting this Mr. Lawes gives the following excellent and simple directions for making this superphosphate:

> Calcined bones are to be reduced, by grinding, to a very fine powder, and placed in an iron pan with an equal weight of water; (a cast-iron trough such as are sold for holding water for cattle will do.) A man with a spade must mix the bone with the water until every portion is wet. While the man is stirring an assistant empties at once into the pan sulphuric acid, sixty parts, by weight, to every one hundred parts of bone. The acid is poured in at once, and not in a thin stream, as commonly recommended. The stirring is continued for about three minutes, and the material is then thrown out. With four common farm laborers and two pans I have mixed two tons in one day. The larger the heap that is made the more perfect the decomposition, as the heap remains intensely hot for a long time. It is necessary to spread the superphosphate out to the air for a few days, that it may become dry.

The evidence shows that the Lawes process is the same as that of the plaintiffs' patent. In each ground calcined bones are mixed with water and sulphuric acid, the proper chemical action and decomposition are allowed to take place, and the result is a dry product, capable of being pulverized. The relative proportions of the three materials—bone-ash, sulphuric acid, and water—differ somewhat in the two processes. Lawes uses ten parts, in weight, of bone, to ten of water and six of sulphuric acid. The plaintiffs prescribe ten of bone to twenty of water and eight of sulphuric acid; but the specification says: "It will be obvious to any practical chemist that the above-described processes of producing this pulverulent acid may be modified in various ways. The proportions of the agents employed may be varied somewhat without materially affecting the result." The prescribed quantity of sulphuric acid in the patent is larger, in proportion to the bone, than in Lawes' process. But it is shown to have been a well-known chemical fact that the greater or less acid strength of the product of such a mixture would be due to the greater or less relative proportion of sulphuric acid used. There is no invention in so varying proportions as the specification itself in effect states. The process remains, in substance, the same. There can be no doubt that Lawes' process, if it had been first resorted to subsequently to the issue of the plaintiffs' patent, would be an infringement of that patent.

The processes being the same, the natural conclusion would be that the products would be substantially alike. The evidence is to that effect. It shows that the product of the Lawes process, as described, is to all practical intents and purposes the same thing as the product of the plaintiffs' process, and capable of being used for the purposes set forth in the specification of the plaintiffs' patent. It is no invention, in preparing the article to be used as an ingredient in food, to carefully wash the bones clean. The direction as to each process is simply to use sulphuric acid or oil of vitriol and calcined or burned bones generally. Any impurity of extraneous matter that would exist in the sulphuric acid or the bones, or in the product, because of the quality of such acid or of such bones in the one case, would exist in the other. The evidence shows that the Lawes product is equally non-hygroscopic with that of the plaintiffs' process; that the one is as much entitled to the appellation of a dry powder as the other, and no more; and that the Lawes product has sufficient acid strength of a permanent character for use for the special purpose of an ingredient in a yeast-powder.

The first two claims of the plaintiffs' patent are, therefore, anticipated by the Lawes process and product. This conclusion makes it unnecessary to consider any of the other matters discussed on the question of novelty.

It was suggested on the hearing that, as the defendant uses starch with his acid, and, as the plaintiffs' patent states, as its preferred method of preparing the acid, the use of starch in it, the first claim ought, at all events, to be held good for the acid when prepared with starch in it, on the ground that starch had never before been used as an ingredient in it. This view was urged on the idea that the case falls within the 9th section of the act of March 3, 1837, (5 U. S. Stat. at Large, 194,) which provides that when a patentee claims, in his specification, "to be the original and first inventor or discoverer of any material or substantial part of the thing patented, of which he was not the first and original inventor, and shall have no legal or just right to claim the same, in every such case the patent shall be deemed good and valid for so much of the invention or discovery as shall be truly and *bona fide* his own; *provided*, it shall be a material and substantial part of the thing patented, and be definitely distinguishable from the other part so claimed without right as aforesaid; and every such patentee, his executors, administrators, and assigns, whether of the whole or of a sectional interest therein, shall be entitled to maintain a suit at law or in equity on such patent, for any infringement of such part of the invention or discovery as shall be *bona fide* his own as aforesaid, notwithstanding the specification may embrace more than he shall have any legal right to claim." This section has no application to the case. It is designed to allow a patentee to recover on one claim of his patent, notwithstanding other claims in it are void for want of novelty. But it requires that the parts claimed without right and the parts rightfully claimed shall be definitely distinguishable, as matters of fact, on the face of the claims—that is, be definitely distinguished from each other in the claims. Here there is no distinction, in the claims, between acid prepared with starch and acid prepared without starch. If there were a claim to the acid prepared with starch and a separate claim to the acid prepared without starch there might, under the statute, be a recovery on the former, although the latter were void for want of novelty, provided there had been no unreasonable delay in filing a disclaimer to the latter.

The bill must be dismissed with costs.

At the same time with the foregoing case the case of the same plaintiffs against John Hecker and George V. Hecker, founded on the same patent, was heard, being argued by the same counsel.

BLATCHFORD, *J.*:

The patent involved in this case is the same one sued on in the case brought by the same plaintiffs against Lauer, just decided. The present defendants are charged with infringing all four of the claims of the patent. The first two are disposed of by the decision in the case against Lauer.

The third and fourth claims are as follows:

> 3. I claim the mixing in the preparation of farinaceous food, with flour, of a powder or powders, such as described, consisting of ingredients of which phosphoric acid or acid phosphates and alkaline carbonates are the active agents, for the purpose of liberating carbonic acid, as described, when subjected to moisture or heat, or both.
>
> 4. The use of phosphoric acid or acid phosphates, when employed with alkaline carbonates, as a substitute for ferment or leaven, in the preparation of farinaceous food.

The proper construction of the third claim is that it claims the mixing of the acid and the alkali with the flour, in a dry state, and stopping at that point, without applying moisture or heat. In other words, it claims the preparing of self-raising flour containing the powder or powders named in the claim, and requiring merely the application of moisture or heat to enable it to be leavened. Against the novelty of this claim the defendants set up a patent granted by the United States May 1, 1849, to John Fowler, assignee of Henry Jones, the inventor. The specification of the Fowler patent says that the invention covered by it consists "in the adding to a certain weight of flour such quantities of alkalines and acids, sugar, and salt, as shall, by the addition of water only, enable such prepared flour to be manufactured into bread, &c., without the use of fermenting matter." The specification then describes a mode of making the prepared flour, by first mixing with one hundred-weight of dry flour ten and a half

ounces of fine dry tartaric acid, and then, after two or three days, mixing with the flour and acid twelve ounces of bicarbonate of soda or fourteen ounces of bicarbonate of potassa, in fine powder, twenty ounces of muriate of soda, (common salt,) and eight ounce of loaf-sugar, in fine powder. The specification adds:

The quantities of acids and alkalies may have to be slightly varied, according to their quality; but the point to be attained is the neutralization of both. My prepared flour, when used to make bread, biscuits, or other like food, only requires to be made into dough with cold water, in the proportion of ten ounces of water to one pound of flour for bread, and about six ounces to one pound of flour for biscuits, and baked at once in a well-heated oven. I do not claim mixing acid and alkali with flour as a substitute for yeast; nor do I claim mixing one of these ingredients with flour in the dry state when the other is dissolved for making bread.

The claim is this:

Mixing both the acid and the alkali with the flour in the dry state, sugar and salt being added or not, at will, substantially in the manner and for the purpose herein set forth, as a new article of manufacture.

In view of the Fowler patent it is impossible to see any patentable novelty in the third claim of the plaintiffs' patent. The prepared flour made with the ingredients named in said claim contains the phosphoric acid, or the acid phosphate, as a mere equivalent for the tartaric acid of Fowler's prepared flour; as much so as a screw or a lever is a mechanical equivalent for a pulley. Any pulverulent acid capable, on the application of heat or moisture, of liberating carbonic acid to make the dough porous, is, in the prepared flour, the equivalent of any other pulverulent acid having the like capacity, so far as regards such prepared flour, before heat or moisture is applied. Everything of substantive patentable invention in regard to prepared flour as composed of an acid in dry powder and an alkaline carbonate in dry powder mixed with dry flour is found in the patent of Fowler. Especially is this so in regard to the plaintiffs' patent, in view of the fact that the specification of that patent discloses no mode of practically mixing the ingredients composing the self-raising flour, but merely states that the acid "may be mixed with flour and bicarbonate of soda" as a substitute for cream tartar and tartaric acid "in the practical preparation of self-raising flour."

The fourth claim is a claim to the use of the acid and an alkaline carbonate, as a substitute for ferment in leaven, in the preparation of farinaceous food. This is a claim to the actual use of such acid and alkali in making raised dough. Nothing is shown which anticipates this claim, and the invention covered by it is patentable. Horsford was the first to use phosphoric acid or an acid phosphate for the purpose. It required experiment and invention to find out whether phosphoric acid could be used in place of tartaric acid practically and successfully, and with safety to health. As it is admitted and proved that the defendants have used what is substantially the same acid described in the plaintiffs' patent, mixed with an alkaline carbonate, as a substitute for leaven, in making bread from flour, they have infringed the fourth claim of that patent, and there must be a decree for the plaintiffs for an account of profits as to that claim. The question of costs is reserved.

On the settlement of the decree in the case against the Heckers, the plaintiffs asked to have the court review its decision as to the third claim, and to consider whether, in the light of the decision of the Supreme Court in the case of *Rees* vs. *Gould*, (2 Off. Gazette of Patent Office, 624,) the third claim was not valid. They also asked that the decree should direct that the account to be taken, on the infringement of the fourth claim, should include an account of the profits derived by the defendants from the sale of the mixture described in the third claim, on the ground that the defendants, by selling such mixture, were joint infringers of the fourth claim with every purchaser of such mixture from them, who used it in infringement of the fourth claim.

BLATCHFORD, *J.*:

In respect to the validity of the third claim of the plaintiffs' patent I am referred to the case of *Rees* vs. *Gould*, decided by the Supreme Court of the United States, (2 Off. Gazette of Patent Office, 624.) I do not understand that any different doctrine is laid down in the opinion delivered in *Rees* vs. *Gould* from that which is laid down in the opinion delivered in the same court in *Seymour* vs. *Osborne*, (11 Wallace, 516, 555, 556.) by the same judge, Mr. Justice Clifford. In view of the construction given by me to the third claim of the plaintiffs' patent and of what is found in the Fowler patent, and even irrespective of the evidence as to what was known prior to the plaintiffs' patent in regard to phosphoric acid and acid phosphate, and their chemical and other qualities and properties, I am confirmed, on full reflection, in the views and conclusions stated in my former decision in this case, and am of the opinion that, in respect to such third claim, the substitution of phosphoric acid or acid phosphate in the mixture referred to in such claim in place of the acid named in Fowler's patent was a mere formal and colorable alteration of Fowler's mixture, within the doctrine of *Seymour* vs. *Osborne*, and not an invention and not the subject of a patent.

At the hearing it was admitted and proved that the defendants had used what was substantially the same acid described in the plaintiffs' patent, mixed with an alkaline carbonate, as a substitute for leaven, in making bread from flour. It was, therefore, held that they had infringed the fourth claim of the patent. The proper decree, therefore, is that they have infringed the fourth claim, and that they account for the profits in consequence of their infringement of said fourth claim. Whether such infringement has taken place solely by a use of what is named in the fourth claim irrespective of any selling by the defendants of the mixture claimed in the third claim, or whether such infringement has taken place, also, through sales by the defendants of such mixture, in connection with the use of it by the vendees under the fourth claim, will be a question to arise on evidence to be given on the accounting as to the facts attending such sales, in connection with the use by the vendees of the things sold.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

DRAPER *vs.* HUDSON.

In Equity.—Before Shepley, J.—Decision March 11, 1873.]

A patent for an article of manufacture cannot be sustained on the ground that it was fabricated by new and improved machinery; it must be a new and improved thing in itself, possessing novelty of its own, independent of the devices, processes, or arts by which it was produced.

Where the defendant in a bill for infringement had deceased, and there was no prayer for a discovery against the executor, nor proof of infringement by him, the title to relief by discovery and injunction was held to have failed, and, as a mere incident of that, the right to an account also, and the bill was dismissed without costs.

[*J. B. Robb*, for complainant.

Walter Curtis and *C. M. Reed*, for defendant.]

SHEPLEY, *J.*:

The first claim in complainant's patent, as reissued, is for the combination of the devices described in his patent for producing letters and figures upon the edges of type-blocks for hand-stamps and other purposes, substantially as set forth. The evidence fails to show any infringement of this claim after the date of the reissued patent. The second claim is for, as a new article of manufacture, a type-block with letters, figures, or characters produced thereon, in the manner substantially as described. The patent itself shows that a type-block such as described was not a new article of manufacture. It describes at least one mode by which a similar type-block had been made before, but which mode consumed considerable time and was very expensive. His type-block is not represented in the patent as a new article of manufacture in any other sense than as an old article made upon a new machine. This is not a new manufacture in the sense of the patent law. It could not have been the intention of the statute that pins, matches, nails, and other old articles in common use should be patented as new articles of manufacture simply because they were fabricated by the use of new and improved machinery, unless the product itself was a new and improved product, and as such possessing novelty of its own, independent of the new devices or processes or arts by which it was produced. The second claim of the patent cannot, therefore, be sustained.

The record in this case shows the death of the defendant. No injunction can issue against the defendant, and, as there is no proof of infringement by the executor, none can issue against him. No discovery is prayed for against the executor, and there is no presumption of any knowledge by him of his testator's acts. When the title to the principal relief, which is the proper subject of a suit in equity—the injunction and discovery—fails, the incident right to an account fails, also. *Price's Pat. Candle Co.* vs. *Beawans C. Co.*, 4 K. and J., 727; *Bailey* vs. *Taylor*, 1 R. & M., 73; *Smith* vs. *London & S. W. R. R. Co.*, Kay, 415; Kerr on Injunctions, 435. Although the jurisdiction of the circuit court in equity in patent causes rests upon statute provisions, it is to be exercised according to the course and principles of courts of equity; and the Supreme Court of the United States having decided in *Stevens* vs. *Gladding*, 17 Howard, 455, that "the right to an account of profits is incident to the right to an injunction in copy and patent right cases," it would seem to follow that in a case like the present, where the title to equitable relief fails, the general rule of equity applies that the incidental relief fails, also.

Bill dismissed without costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

23,820.—*Manufacture of Watch-Cases.*—Granted to JAMES BOSS, May 3, 1859. Hearing April 16, 1873.

23,826.—*Skate-Fastenings.*—Granted to JOHN H. COE and WILLIAM B. SNIFFEN, May 3, 1859. Hearing April 16, 1873.

23,860.—*Cotton-Presses.*—Granted to H. W. RANDLE, May 3, 1859. Hearing April 16, 1873.

23,875.—*Lamp-Shades.*—Granted to CHARLES and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860. Hearing April 16, 1873.

23,882.—*Cements for Roofing.*—Granted to NATHAN A. DYAR, May 3, 1859. Hearing April 16, 1873.

23,886.—*Cultivators.*—Granted to MILTON ALDEN, May 10, 1859. Hearing April 23, 1873.

23,893.—*Skate-Fastenings.*—Granted to EDWARD BEHR, May 10, 1859. Hearing April 23, 1873.

23,921.—*Harvesting-Machines.*—Granted to M. G. HUBBARD, May 10, 1859. Hearing April 23, 1873.

23,924.—*Mail-Bags.*—Granted to THOMAS J. LAMDIN, May 10, 1859. Hearing April 23, 1873.

23,950.—*Clock-Dials.*—Granted to S. E. ROOT, May 10, 1859. Hearing April 23, 1873.

23,957.—*Lathes for Turning Irregular Forms.*—Granted to CHARLES and ANDREW SPRING, May 10, 1859. Hearing April 23, 1873.

23,970.—*Stoves.*—Granted to JOHN G. WIDMANN, May 10, 1859. Hearing April 23, 1873.

23,983.—*Cooking-Stoves.*—Granted to HENRY G. LEONARD, May 10, 1859. Hearing April 23, 1873.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tyres.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,486.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHERERLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,586.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,735.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE E. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 30, 1871. Hearing August 6, 1873.

25,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 29, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,557.—*Improvement in Sewing-Machine*, granted to WILLIAM CLEVELAND HICKS, April 12, 1859; reissued March 4, 1873, numbered 5,305.

Claim.—1. The combination, substantially as herein set forth, of a flat-shuttle sewing-machine table, provided with a shuttle-driver or race-way running substantially parallel with its upper surface; a bracket-arm, attached by its post to one end of said table, and extending substantially parallel with said shuttle-race to support the needle-stock and mechanism, substantially as set forth, for giving said needle-stock a vertical reciprocating motion by means of a cam or crank on the driving-shaft; a shaft arranged at right angles to said shuttle-race, in a bearing or bearings attached to the platform of the table, provided with a cam or crank which operates the feed, and with a crank which reciprocates the shuttle once forward and back at each revolution, by a continuous and positive crank motion, both located under the table and under the post of the bracket-arm; a wheel-feed or other feeding mechanism under the table; and a shuttle-driver, all arranged in such manner that the direction in which the materials to be sewed and fed shall be in a line parallel with said bracket-arm, and toward and into the bight formed by the said arm and the table.

2. The arrangement, substantially as herein set forth, of a partially-revolving thread-controlling crank or lever, on a stud set at right angles to the bracket arm, above and parallel with the table, and connected, substantially as described, with a cam or crank on the main shaft under the table, in such manner that the needle-thread is entirely controlled and drawn up between the tension apparatus and the needle by said lever, actuated by the movements of said cam or crank without the intervention of the needle-stock.

3. The combination, substantially as herein set forth, of the needle-stock, bracket-arm, pinion, connecting rod and lever, with the driving-shaft, in such manner that the motions of the cam or crank on said shaft may be transmitted to the pinion and needle-stock, substantially as herein set forth.

4. The combination, substantially as set forth, in a shuttle sewing-machine, of a table provided with a shuttle race or way running parallel to its upper surface, and with a bracket-arm, fastened by its post at one end of said table, lying substantially parallel with said shuttle race or way, to support a vertically-reciprocating needle-stock; and a shaft located (in a bearing or bearings attached to a platform of a table) at right angles to the shuttle race or way, and bracket-arm provided with cams or cranks under the table, and under the post of the bracket-arm, for actuating the shuttle and feed, by means of connecting-rods, reciprocating in the direction of their length, substantially as set forth; and connected, through the post of the bracket-arm, to a rod or bar running longitudinally through the bracket-arm, to actuate the mechanism which reciprocates the needle-stock, substantially as set forth, so that the table, the bracket-arm, and the connecting rods or bars, may be lengthened in the same direction, without changing the cams or cranks which actuate the needle-stock and shuttle, or their combined motions in reference to each other, substantially as set forth.

DISCLAIMERS FILED.

23,525.—LEVI W. BUXTON.—*Improvement in Bedstead-Fastenings*, granted April 5, 1859. Disclaimer filed April 1, 1873. Disclaims:

"That part of the claim in the specification of said Letters Patent which is in the following words, to wit:

"'I also claim the combination of the hook *e'* with the tube or friction roller *f* and stationary pin *g*, substantially as and for the purposes described.'"

23,445.—CYRUS CHAMBERS.—*Improvement in Paper-Folding Machines*, granted April 5, 1859. Disclaimer filed April 4, 1873. Disclaims:

"That part of the claims in specification of said Letters Patent which is in the following words, to wit:

"'Second. Adjusting one of the register-pins *c'* laterally and longitudinally, independently of the other pin, by means of the slides n^1 and n^2, or their equivalents.'

"'Seventh. The curved wires 15 and 16, or their equivalents, attached to the machine in any convenient manner, situated under the folding apparatus and adjacent to the trough, for the purpose specified.'"

133,376.—JAMES F. MASON.—*Improvement in Gloves*, granted November 26, 1872. Disclaimer filed April 4, 1873. Disclaims:

"The following parts of the glove claimed as new in the aforesaid specification, to wit:

"The pattern therein described and marked D; also, all of the pattern therein described and marked E, except that portion which covers and protects the back of the little finger, near the end, forming a cap-piece substantially like the patterns therein described and marked I and J, and also all the pattern therein described and marked A, except the forefinger cap-piece thereof, designated B in the specification."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date April 1, 1873.]

6,538.—*Music-Stand.*—WILLIAM P. BIGELOW, Natick, Mass. Application filed February 17, 1873.

6,539.—*Pen Sign.*—LE ROY W. FAIRCHILD, New York, N. Y. Application filed October 29, 1872.

6,540.—*Jewelry-Case.*—MAURICE HENDBERG, Boston, Mass. Application filed March 10, 1873.

6,541.—*Soda-Water Apparatus.*—CHARLES LIPPINCOTT and JAMES PATTERSON, Philadelphia, Pa. Application filed March 19, 1873.

6,542.—*Soda-Water Apparatus.*—CHARLES LIPPINCOTT and JAMES PATTERSON, Philadelphia, Pa. Application filed March 19, 1873.

6,543.—*Soda-Water Apparatus.*—CHARLES LIPPINCOTT and JAMES PATTERSON, Philadelphia, Pa. Application filed March 19, 1873.

6,544.—*Tumbler-Holder.*—CHARLES LIPPINCOTT and JAMES PATTERSON, Philadelphia Pa. Application filed March 19, 1873.

6,545.—*Lubricating-Cup.*—FREDERICK LUNKENHEIMER, Cincinnati, Ohio, and JAMES MEEHAN, Covington, Ky. Application filed March 21, 1873.

6,546.—*Floor Oil-Cloths, &c.*—CHARLES T. METER and VICTOR E. METER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed March 25, 1873.

6,547.—*Floor Oil-Cloth, &c.*—CHARLES T. METER and VICTOR E. METER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed March 17, 1873.

6,548.—*Group of Statuary.*—JOHN ROGERS, New York, N. Y. Application filed March 17, 1873.

6,549.—*Cook-Stoves.*—WILLIAM G. SEMPLE, Cincinnati, Ohio, assignor to GALWAY, SEMPLE & CO., same place. Application filed February 3, 1873.

6,550.—*Billiard-Table.*—NIKOLAUS STOLL, Chicago, Ill. Application filed March 18, 1873.

6,551.—*Carpet.*—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN DOBSON and JAMES DOBSON, same place. Application filed March 19, 1873.

6,552.—*Carpet.*—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN DOBSON and JAMES DOBSON, same place. Application filed March 19, 1873.

6,553.—*Carpet.*—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN DOBSON and JAMES DOBSON, same place. Application filed March 19, 1873.

6,554.—*Carpet.*—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN DOBSON and JAMES DOBSON, same place. Application filed March 19, 1873.

6,555.—*Lamp-Chimney.*—MARION J. WELLMAN, New York, N. Y. Application filed March 12, 1873.

6,556.—*Lamp-Chimney.*—MARION J. WELLMAN, New York, N. Y. Application filed March 12, 1873.

6,557.—*Bell-Pulls.*—JOHN B. WHITNEY, New York, N. Y. Application filed January 6, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date April 1, 1873.]

1,187.—*Watches and Watch Materials.*—BOURQUIN BROTHERS, New York, N. Y. Application filed March 10, 1873.

1,188.—*Boots and Shoes.*—THOMAS EMERSON'S SONS, Wakefield, Mass. Application filed March 7, 1873.

1,189.—*Boots and Shoes.*—THOMAS EMERSON'S SONS, Wakefield, Mass. Application filed March 7, 1873.

1,190.—*Printing-Inks and Varnishes.*—LOUIS H. GEIS, New York, N. Y. Application filed March 22, 1873.

1,191.—*Playing-Cards.*—VICTOR E. MAUGER, New York, N. Y. Application filed March 15, 1873.

1,192.—*Candles.*—PROCTER & GAMBLE, Cincinnati, Ohio. Application filed March 17, 1873.

1,193.—*Medicines.*—RAINER RATTINGER, St. Louis, Mo. Application filed February 19, 1873.

1,194.—*Ruffles and Dress-Trimmings.*—JAMES V. ROCKWELL, New York, N. Y. Application filed March 10, 1873.

1,195.—*Medicine.*—D. DODGE, TOMLINSON, San José, Cal. Application filed March 29, 1873.

1,196.—*Hams and Shoulders of Pork.*—FREEMAN P. WOODBURY, New York, N. Y. Application filed February 27, 1873.

1,197.—*Hams and Shoulders of Pork.*—FREEMAN P. WOODBURY, New York, N. Y. Application filed February 27, 1873.

1,198.—*Hams and Shoulders of Pork.*—FREEMAN P. WOODBURY, New York, N. Y. Application filed February 27, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date April 1, 1873.]

ORIGINAL PATENTS.

137,279.—*Alloy for Producing Ornamental Coatings on Metals.*—HENRY AIKEN, Philadelphia, Pa. Application filed February 21, 1873.

Antimony, zinc, tin, copper.

Claim.—1. The mode of making ornamental castings by pouring a melted compound of metals, substantially as set forth, in the open air into open molds or onto forms.

2. The mode of making ornamental castings by casting an alloy of metals, substantially as described, in open molds, or over forms and then molding by compression.

3. The alloys of zinc and antimony with or without tin or copper, for producing colored castings, substantially as set forth.

137,280.—*Sash-Holder.*—CHARLES C. ALGEO, Pittsburg, Pa. Application filed March 10, 1873.

A cam-fastener for the meeting-rail of the sash is furnished with a deep groove running around its edges and sides. This groove is intended to prevent forcing the cam back with the blade of a knife inserted from the outside between the sashes. The knife-point, being in the groove, cannot crowd the cam back.

Claim.—The groove *i* formed in the cam G, substantially as and for the purposes herein set forth.

137,281.—*Stalk-Cutter.*—JAMES ARMSTRONG and GEORGE ARMSTRONG, Elmira, Ill. Application filed October 28, 1872.

A pair of cutting-rollers are mounted upon independent frames and secured to a main frame supported by three wheels, the forward and middle one of which is a swivel-wheel. The rollers are elevated by a self-locking hand-lever, assisted in raising by a foot-lever.

Claim.—1. A foot-lever in combination with a self-locking hand-lever, I, for the purpose and substantially as described.

2. The tongue hinged directly to the main frame, in combination with the swivel-wheel, the tongue and swivel-wheel being on the same end of the frame, so as to turn the machine bodily when the cutter-heads are raised, substantially as described.

3. The loops b^3 and yoke or coupling *b* attached to the front ends of both cutter-carrying frames C, in combination with the draft-chain b^1 and pulley *d*, whereby the draft of the team will act to depress the cutters, substantially as described.

4. The main frame mounted on three transporting-wheels, the forward and middle one of which is a swivel-wheel, and runs in the center between the rows which are being cut, substantially as described.

137,282.—*Spool-Holder and Thread-Cutter.*—ALMON PERRY AYERS, Benton Harbor, Mich. Application filed July 1, 1872.

The spool-holder has a spring flap, which carries upon its face a hooked thread-cutter.

Claim.—The end pieces *a' a*, center-bolt *d*, hinged flap *b* carrying a cutter, *c*, hinge-bolt *g* and its spiral spring, all combined and arranged as shown and described.

137,283.—*Screw-Cutting Die.*—SAMUEL D. BATES, Lewisburg, and SAMUEL W. MURRAY, Milton, assignors to MURRAY, DOUGALL & COMPANY, Milton, Pa. Application filed January 28, 1873.

The dies, situated in the chuck, have pins projecting into blocks that slide in a cam-groove in a disk fitted on the hub of the chuck. A lever, acting against stops on the edge of the cam-disk, and released by a cam on the chuck, holds the cam-disk stationary while the chuck revolves, thus opening and closing the dies.

Claim.—The cam-disk D, provided with stops *g g'*, in combination with a chuck, A, carrying the cutting-dies, and provided with a releasing-cam, A, the whole being constructed and operating substantially in the manner shown and described.

137,284.—*Sawing-Machine.*—EDWIN BENJAMIN, Chicago, Ill., assignor of one-half his right to SAMUEL W. PEARE, same place. Application filed March 3, 1873.

The guide-rolls, together with the table upon which they are placed, are adjusted by a system of screw-gears.

Claim.—1. The combination of the rollers G G, rack I *f*, pivot-sleeve N, plate H, and screw-rod M J, substantially as and for the purpose set forth.

2. The combination of the rollers G G, carriage T V, depending standards Rp toothed wheels O O, sleeve N, and screw-rod *a b*, as and for the purpose set forth.

137,285.—*Steam-Trap.*—JAMES H. BLESSING, Albany, N. Y., assignor to FREDERICK TOWNSEND and JAMES H. BLESSING, same place. Application filed January 2, 1873.

Condensed water from the coils in the building enters stationary tanks, from which it flows into a supplemental gravitating chamber suitably supported by a weighted lever, and by depressing said chamber through suitable valve mechanism allows the steam to pass into the tank and force the water from it and the chamber into the boiler.

Claim.—1. The auxiliary tank S combined with the gravitating receiver A, constituted and operating substantially as described.

2. The valve-tripping mechanism applied on top of the gravitating receiver A, in combination with such receiver and the tank S, substantially as described.

137,286.—*Draft-Evener.*—RUSSELL BUNKER, Hudson, Wis. Application filed September 7, 1872.

Attaching the double-tree to the draft-pole by means of a slotted tongue-piece, said tongue-piece having attached to it rods, which extend back and outward, and are connected by two bell-crank levers pivoted in suitable bearings secured to the cross-bar, and a rod extending from one to the other, so that the draft is transferred from the double-tree to the draft-pole through these rods, thereby equalizing the draft when a wheel on one side of the vehicle is obstructed, and preventing the pole from deviating to the right or left.

Claim.—1. The vibrating and bodily movable double-tree C, connected by chains J J to connected levers *i i*, substantially as described.

2. The slotted tongue-piece *g* on double-tree C, connected by a pin, *e*, to the pole B, and connected to the pole-bar A by means of levers *i i*, a connecting-rod, D, and arms *h h*, substantially as described.

137,287.—*Spring-Bed.*—OLIVER C. CAMPBELL, Omaha, Neb. Application filed February 24, 1873.

Coiled springs at the head, foot, and center are joined by connecting-links. An auxiliary spring is attached one end to an

intermediate bar, the other to the links near the hinged head-rest frame, forming a joint and affording resistance to the head-rest. The latter is operated by a serrated plate and spring-pawl.

Claim.—1. The combination of the springs *a* and connecting-links *b* with the auxiliary springs *c*, as and for the purpose specified.

2. The frame A provided with the adjustable part B, in combination with the springs *a* and *c* and their connections, substantially as set forth.

3. The frame B provided with the serrated plates *e*, in combination with the sliding pawls *f*, springs *n*, and cord *g*, all constructed and operating substantially as and for the purpose specified.

4. The coiled springs *a*, connecting-links *b*, and frame A, in combination with the springs *c*, the adjustable part B, and its operating devices, as shown and described.

137,288.—*Machine for Inserting Screw-Pegs in Boots and Shoes.* ANDREA CAVALLI, San Francisco, Cal., assignor of one-half of his right to VICTOR NOLY, same place. Application filed May 17, 1872.

The two revolving forms carrying wire reels are provided with casings for inclosing thumb-screws for tightening and metallic tubes for conducting the wire, that two threads of wire may be inserted and severed at the same time. That different thicknesses of wire may be used, adjustable dies are provided.

Claim.—1. The revolving forms F F', provided with reels D D', and gearing *b b' b²*, placed in connection with the actuating-wheel B, stand K, head-plate M, and feed-block *c*, in the manner described, so that two or more nails or screws may be inserted at the same time into boot or shoe leather, substantially as and for the purpose hereinbefore set forth.

2. The adjustable casings C C', and tubes *t t'*, in combination with the wire-feeding reels D D', screws *m m' n n'*, and tubular shafts *s s'*, substantially as and for the purpose hereinbefore set forth.

3. The adjustable metallic form O, provided in the central block *e*, through which the two wires pass, in combination with the reels D D' and tubular shafts *s s'*, substantially as and for the purpose hereinbefore set forth.

4. The adjustable die *g* in the holders *d d'*, in combination with the supply-wire reels D D', head-plate M, and tubular shafts *s s'*, substantially as and for the purpose hereinbefore set forth.

137,289.—*Burial-Casket Handle.*—ALFRED G. CHAPMAN, East Hampton, Conn., assignor of one-half his right to HENRY E. NILES, same place. Application filed January 24, 1873.

The knuckle in which the lifting-arm is pivoted fits over and conceals lugs, which extend outward from the ear or back plate. A single pivot holds the handle in the knuckle, and the knuckle upon the plate.

Claim.—1. The combination of the knuckle *f* with the ear *a*, the knuckle being so shaped as to cover and conceal the teats *b b*, all constructed and arranged substantially as described, for the purpose set forth.

2. The combination of the screw-pin *c* with the knuckle *f*, teats *b b*, arm *d*, and ear *a*, in such shape that the pin performs the double office of a pivot for the arm *d* and of securing the knuckle in place, the whole constructed and arranged substantially as described, for the purpose set forth.

137,290.—*Apparatus for Cleaning Sewers.*—WILLIAM H. CHASE, Washington, D. C. Application filed March 1, 1873.

Claim.—1. A machine for cleaning sewers, composed of a sectional tubular shaft mounted upon trucks, substantially as and for the purpose specified.

2. A machine for cleaning sewers composed of sections A of pipe united together by universal joints A', and mounted upon trucks B, substantially as and for the purposes specified.

3. A machine for cleaning sewers composed of a sectional tubular shaft mounted upon trucks, in combination with a turbine, F G, to operate a boring-tool, substantially as specified.

4. The sectional tubular shaft mounted in bearings upon trucks, in combination with an eccentric scraper-blade, E, substantially as and for the purpose specified.

137,291.—*Stove-Support.*—WALTER M. CONGER, Newark, N. J. Application filed January 9, 1873.—A.

Claim.—1. The within-described stove-support, having one or more shields formed separate from the main body, and supported by a central stem with space around the entire edge for ventilation between the parts, substantially as herein specified.

2. The dome *a*, screw *b*, and nut C, in combination with the body A and shield or shields D, the head of the screw being let up into the dome *a*, as herein specified.

137,292.—*Stove-Support.*—WALTER M. CONGER, Newark, N. J. Application filed January 9, 1873.—B.

Claim.—The within-described stove-support, having a shield in two thicknesses with a non-conductor between mounted at a little distance therefrom, with space for ventilation between the shield and main body, substantially as herein set forth.

137,293.—*Apparatus for Trimming the Heels of Boots and Shoes.* LOUIS COTÉ, St. Hyacinthe, Canada. Application filed March 6, 1872.

In hand apparatus for the above purpose, the knife-carrier is provided with a joint, by reason of which the knife can be set in position to conform to the shape of the heel. A long elbow is attached to the holder of the boot that it may enter the leg of and hold more securely "stoga boots."

Claim.—1. The knife-carrier *n*, constructed with joint at 1, substantially as described.

2. The plate *s*, in combination with the elbow *t*, pin *t'*, and spring *t²*, substantially as and for the purposes described.

137,294.—*Horse-Power.*—EARLSWORTH CROCKETT, Macon, Ga. Application filed January 11, 1873.

Claim.—1. A horse-power composed essentially of a stationary shaft or post, A, tubular shaft D supported on anti-friction balls *c c*, driving-wheel E, pulley I, and bearing-arm L, all arranged substantially as herein specified.

2. The arm L provided with the bearings *o p* and brace *r*, or its equivalent, arranged in combination with the stationary shaft A, substantially as and for the purpose herein specified.

137,295.—*Car-Spring.*—DAVID G. DANIELS, Pittsburg, Pa. Application filed February 5, 1873.

Equalising spring-plates are interposed between the main plates that the strain shall be distributed equally throughout their entire area.

Claim.—1. The equalizing spring-plates *h*, applied between the pairs of main spring-plates *c*, all constructed of the form of segments of a cylinder, substantially as described.

2. The springs *c* and *h* and inclosed substance *g*, piled together in a nest and connected by a bolt, C, and nut *n*, substantially as described.

3. The overlapping cap B, constructed with a centrally-depressed portion, B', and combined with the box A, substantially as and for the purpose described.

137,296.—*Steam-Washer.*—JACOB DAVIS, Florida, Mass. Application filed February 5, 1873.

A wash-boiler constructed with steam-pipes on its bottom, one with openings for steam to escape, over which is a sloping false bottom, open in its center and covered by a perforated plate. At or near the ends are upright conductors, with openings at their tops, one of which is open at its center that it may be removed in sections, and has hinged guides to conduct the water and steam as required.

Claim.—1. The arrangement of the hinged rim *g* and hinged plate *l*, substantially as and for the purpose hereinbefore specified.

2. The guard-plate *n*, when combined with the bottom *f*, constructed substantially as above described.

3. The arrangement of the valve *m* with the plate *l'* and bottom *f*, as and for the purpose above set forth.

4. The corrugated bottom *f f'*, arranged in combination with plate *h* and flue *k*, as above specified.

5. The arrangement of the steam-washer above described with the support *b* and pipes *c c' c''*, and also with the pipe *d*, for the purpose of using steam or hot water as a heater or for motive power, as specified above.

137,297.—*Case for Laces, Ribbons, &c.*—MARTIN DEITZLER, Ashland, Pa., assignor of one-half his right to HAMILTON ADAMS, same place. Application filed February 12, 1873.

A box or case, open at its center, and hinged. Opposite the hinged connection is an opening, through which the article to be shown is passed. In the center of the box or case is a shaft, on which the article to be shown is held by its spool or holder, and is held in its position by its journal passing through the box, to which the crank to give it motion is attached. Outside the box, under the opening, is a recess, into which cards, with the name or price of the article, may be marked.

Claim.—The hinged case A B provided with spools E, on which are collars I and spring-clamps H to hold the strip G, and constructed with a recess, K, to receive a number of marking-cards, all substantially as shown and described.

137,298.—*Carrier for Lathes.*—FRANK FERRIN, Camden, N. J. Application filed February 19, 1873.

One end of the work is inserted into the ring D, with its axis coinciding with the axial line of the said ring, and the screws F are turned so as to hold the work. The ring is then slipped over the sleeve, the lugs entering slots, the tail-stock moved up so as to hold the work between the two centers in the usual manner, and the screws are again turned so as to clamp the work more tightly, and the machine is started.

Claim.—The combination, with a lathe spindle and center, of the sleeve B provided with one or more lugs, C, and the loose slotted sleeve or ring D provided with set-screws F, all substantially as described.

137,299.—*Rubber Eraser.*—EZRA W. FROST, Brooklyn, N. Y. Application filed March 6, 1873.

A flat piece of rubber, within the center of which is secured the metallic grommet.

Claim.—As a new article of manufacture, the centrally-hollowed eraser described, having the hollow face-pieces B C secured together through the erasive material A, and adapted to serve as herein specified.

137,300.—*Car-Spring.*—GEORGE F. GODLEY, New York, N. Y. Application filed July 27, 1872.

A case and plunger of peculiar shape, and spiral springs of different size or power, separated by a diaphragm of shape corresponding to that of the case, and having, as have also the case and plunger, cups for the reception of these springs, the object being to construct a car-spring which will operate equally well under a light or heavy load.

Claim.—1. The movable diaphragm-plate F, constructed with cups on one face of a diameter or size greater than those on its opposite side, as and for the purpose set forth.

2. The follower C having bearing-points E, and adapted to enter and move within the under side of the case, and constructed with cups upon its upper side to receive spiral springs and hold them from contact with the sides of the case.

3. The combination, with the diaphragm-plate F, of the two sets of spiral springs G and H, those of one set having a diameter or power different from those of the other set.

4. A follower constructed with bearing-points E, combined with a case having ribs *g*, which, when in contact with E, leave spaces *x* between the follower and its case, substantially as and for the purpose set forth.

5. The case A, constructed with rounded parts to receive the spirals and follower, and with the ribs *g* to form bearing-points, as and for the purpose set forth.

6. In a car-spring, the combination with the cups to receive the spiral springs at their extremities of the springs having their ends cut and coiled as described, and thus forming their own seats, and requiring no grinding or reducing or any holes to receive their tips.

137,301.—*Cotton-Bale Tie.*—ANDREW J. GOING, Clinton, La. Application filed February 26, 1873.

Claim.—The within-described bale-tie, consisting of the strip A, having one or more tongues, *b*, at each end, with a slot, *a*, on each side of each tongue, substantially as shown and described, and for the purposes herein set forth.

137,302.—*Vise.*—DAVID GREEN, Penrock, Ohio. Application filed August 26, 1872.

The lever bears against the inclined pieces placed inversely to each other. By turning the lever the jaws are tightened as it acts upon the inclined planes.

Claim.—The fulcrums E E, arranged inversely to each other, combined with the lever C, as and for the purpose described.

137,303.—*Gas-Burner.*—GEORGE W. HATCH, Brooklyn, N. Y., assignor to LYON & FELLOWS MANUFACTURING CO., same place. Application filed January 23, 1873.

A gravitating valve rests either upon or under the gas port in the base of the burner. It is forced toward its seat by a shaft, bent at its center for the purpose, to which shaft the levers outside the burner are attached.

Claim.—In combination with a gas-burner the gravitating valve B controlled by the cam-shaft C, provided with either a single or a double lever, as described, and for the purposes set forth.

137,304.—*Machinery for Finishing the Heels of Boots and Shoes.* LORENZO P. HAWKINS, Lynn, Mass., assignor to WILLIAM F. MORGAN and BENJAMIN DORE, same place. Application filed September 12, 1872.

Claim.—The combination, with the reducing or finishing wheel, of a guard-plate, adapted to enter the rand seam, and attached to a sliding bar or support, arranged to be moved more or less, as desired, toward or away from the wheels, and there fixed in such position, substantially as shown and described.

137,305.—*Lacing-Stud.*—DAVID HEATON, Providence, R. I. Application filed February 7, 1873.

Improvement on patents Nos. 120,474 and 133,233. A button of a sheet-metal blank is made similar to those used in above patents, but arranged so that the lacing-post is in the center of the button-head instead of on one side.

Claim.—The improved shoe-button or lacing-stud, made from sheet metal, with its neck or shank *n* in the center of the head H, by forming the under part *b* of the head H and the neck *n* and the table F from two similar parts of a blank, bent or clasped together at the center, substantially as shown and described.

137,306.—*Shade-Holder.*—MARK WIGGINS HOUSE, Cleveland, Ohio, assignor to THE CLEVELAND NON EXPLOSIVE LAMP COMPANY, same place. Application filed December 6, 1872.

A metallic ring, having an inwardly-projecting flange upon its upper edge, is fitted around the burner and rests upon a slight flange thereon. It is secured in place upon one side by the chimney-screw and flange, between which it rests, and upon the opposite side by a set-screw passing up through the ring and abutting against the lower surface of the chimney-support.

Claim.—1. The improved shade-holder constructed, substantially as before set forth, with a ring-stock, a set of hook-ended arms free at their outer ends, an internal flange, and a screw arranged, as described, in position to bear against the under side of the gallery of the burner to which the shade-holder may be applied.

2. The combination of the said shade-holder with the chimney-gallery of the burner by means of the flange and the screw of the shade-holder and the hub of the fastening of the chimney-gallery, substantially as before set forth.

137,307.—*Carburetor.*—JOHN F. G. KROMSCHRÖDER, Gloucester street, Regent's Park, England. Application filed October 1, 1872.

Above the vaporizing-chamber is arranged the air-forcing apparatus, with the hydrocarbon-reservoir surrounding it, the reservoir being connected with the vaporizing-chamber by the usual bird-fountain feed.

Claim.—1. The combination and arrangement of the air-forcing apparatus, the hydrocarbon-reservoir, and the volatilizing-chamber, substantially as before set forth, the volatilizing-chamber being at the base of the machine, the hydrocarbon-reservoir being above the said chamber, and the air-forcing apparatus being at the upper part of the machine.

2. The combination of the following instrumentalities, viz: The air-forcing apparatus, the hydrocarbon-reservoir, the volatilizing-chamber, and the non-conducting jacket for the said chamber, substantially as before set forth.

3. The combination and arrangement of the following instrumentalities, viz: The volatilizing-chamber arranged at the base of the machine, the hydrocarbon-reservoir arranged above the volatilizing-chamber, the bird-fountain arrangement between the reservoir and the volatilizing-chamber, and the air-forcing apparatus arranged at the upper part of the machine and over the base containing the volatilizing chamber.

137,308.—*Changeable-Gage Railway-Truck.*—JAMES MCCAULEY, Elkton, Md. Application filed January 24, 1873.

The truck-frame is divided into two sections, the inner ends of the frame being provided with racks, and, by means of pinions, secured to the ends of a central shaft. The frame is laterally extended or contracted.

Claim.—The combination of frame-pieces H H and F' E', guide-bars I I, and blocks D E D E, constructed substantially as and for the purpose described.

2. The combination of the center shaft A provided with the pinions C C, the blocks D D E E having the rack-bars *v v v v*, substantially as shown and described, for the purpose set forth.

137,309.—*Combined Corn-Planter and Plow.*—JOHN T. MCELHENEY, Moberly, Mo. Application filed January 11, 1873.

A hopper on, and a spout and shoe beneath, the axle of a pair of running-wheels; a frame for plows in front; a single covering-wheel behind, with seat over it, from which the driver, by means of a lever, &c., can, when turning the machine, raise the front and rear frames and throw their weight on the running-wheels; at the same time, by another lever, he can unclutch the wheels and raise the shoe. A valve at the bottom of the spout is operated by a semicircular slot on the face of a circular seed-cup box.

Claim.—1. The combination of the wheel K attached to the axle of the running-wheels, channel N, lever O, spring *w*, spout E, and valve T, all constructed and arranged substantially as and for the purpose shown and specified.

2. The combination of the wheels A A' and their axle, clutches *a a' b b'*, rings *f f'*, rods *n n'*, &c., bands *c c'* having grooves *c c'*, &c., and levers R, H, and H', all constructed and arranged substantially as and for the purpose shown and specified.

3. The frame V, pole Y, segment *z*, extension X, rods Z *z*, arms *g g'*, D D', W W', and 10 10, lever 11, wheels 9 and A A', all combined, arranged, and constructed substantially as and for the purpose shown and specified.

137,310.—*Wrench.*—PETER E. MCINTOSH, Chicago, Ill. Application filed January 4, 1873.

Claim.—The wrench described, consisting of the cased angled lever *f* and its two clicks and springs, ratchet *k*, movable lever *c*, and connecting-rod *d*, arranged as set forth.

137,311.—*Fabric for Dress-Protectors, &c.*—JAMES MCMULLEN, Brooklyn, N. Y. Application filed February 4, 1873.

Claim.—As a new article of manufacture, a water-proof fabric composed of leather scrap and Manilla or other vegetable fiber japanned and rendered impervious, substantially in the manner and for the purpose set forth.

137,312.—*Shingling-Bracket.*—LYMAN W. MERRIAM, Fitchburg, Mass. Application filed March 5, 1871.

The lugs are inserted under the shingles, forming, in connection with a lever, a clamp to assist in retaining the bracket in its place upon the roof.

Claim.—A roofing-bracket having ears or lugs E E' and F F' and suitable feet D D, all substantially as described.

137,313.—*Steam Drop-Hammer.*—FREDERICK B. MILES, Philadelphia, Pa., assignor to FERRIS & MILES, same place. Application filed July 29, 1872.

Upon the movement of the treadle, whose length of vibration is regulated by adjustable stops, the valve which controls passage of steam from the boiler is operated simultaneously with the valve governing the admission of steam to the cylinder, so that positive amount of steam admitted to the valve-chest and relative amount to cylinder is controlled readily. Rubber abutments are provided to prevent concussion.

Claim.—1. The drop D, piston P, and guide-plates, in combination with valves V V' and mechanism, substantially as described, for connecting and operating the same.

2. The treadle T with adjustable screw-stops *t t t* and holes *o o o o o o o o*, in combination with rods *r* and *r'* connecting it to valves V and V'.

3. The bumpers B B in combination with the drop D, when arranged in the manner and for the purpose substantially as specified.

137,314.—*Hub for Wheels of Vehicles.*—JOHN MONK, Norwich, Conn. Application filed November 14, 1872.

A metallic hub-shell extends the length of the hub, and has shoulders and ribs near its ends to hold a wooden core in place, and also has beveled mortises over a groove in the core.

Claim.—1. The combination of a metallic hub-shell, A, with shoulders *a a'*, flanges *b b'*, and mortises B with a wooden center, D, substantially as shown and described, and for the purpose herein set forth.

2. The combination of a hub-shell, A, having flanges *b b'*, shoulders *a a'*, and beveled mortises B with a wooden center, D, having a groove, C, substantially as described, and for the purpose set forth.

137,315.—*Dovetailing-Machine.*—WILLIAM F. MOODY, Chicago, Ill., assignor of two-thirds his right to ELIJAH STONE and CHARLES SWIFT, same place. Application filed January 27, 1873.

Two chisels are arranged in such a manner that one of them has a vertically-reciprocating as well as a vibratory movement. The other reciprocates horizontally, and when operating together they form the mortise of a blind dovetail.

Claim.—1. In a dovetailing-machine, the slotted head *p*, constructed and operating substantially as specified.

2. In a dovetailing-machine, the eccentric sleeve *k*, constructed and operating substantially as specified.

3. The sliding head *b b'*, in combination with the chisel-head P, all so constructed that by the lateral movement of the sliding head an angular or oblique movement can be given to the chisel-head while it retains its vertical position, substantially as specified.

4. The sliding frame G, when provided with one or more springs, *u*, in combination with the bar *z* provided with pins, substantially as and for the purpose specified.

5. The combination, in a dovetailing-machine, of the single vertical chisel *e* with the angular chisel *f* so as to form a dovetail-mortise with two chisels, substantially as specified.

137,316.—*Machine for Turning Axles.*—ARTHUR F. MOORE, Florence, Ind. Application filed September 2, 1872.

The machine is secured upon one end of the piece of timber from which an axle is to be formed. The frame is then revolved by the handles, causing the cutter to travel along the screw.

Claim.—The cutter-guide D, feed-screw J, plate *i*, set-screws *s*, and screw K, in a machine for turning axle-spindles, when arranged to operate, in connection with the plates A and B and pinions F and G, substantially in the manner shown, and for the purposes specified.

137,317.—*Stencil-Plate.*—FRANK L. MORRISON, New Albany, Ind. Application filed January 14, 1873.

The stencil-plate is in a circular hoop form, with one edge turned up to fasten the frame to, the handle being attached centrally and forming the axis about which the hoop revolves.

Claim.—1. The band *c*, with letters or figures cut through it and fastened around a circular frame or wheel with the surface of the lettered band at or near a right angle to the side or face of the frame, substantially as and for the purpose herein shown and described.

2. The circular frame *a* and handle *b*, when used in connection with the band *c*, substantially as and for the purpose herein shown and described.

3. The stencil-braud consisting of the frame *a*, handle *b*, the band *c*, and the shield *d*, all made and operating as herein shown and described.

137,318.—*Ditching and Grading Machine.*—LEVIN D. NOBLE, Cerro Gordo, Ill. Application filed August 5, 1872.

The earth is dislodged by a share or cutter with inclined mold-board attached, which throws the earth upward and outward. The machine runs upon caster wheels as usual, and in addition there is another caster-wheel, mounted in a hinged frame, which runs upon the bank, and is for the purpose of steadying the machine. Flanged guide-wheels also run upon the land-side, upon the edge of the ditch, which gage the cut. A scraper and spreader, connected by jointed and extensible arms, throw the earth off from the edge of the ditch.

Claim.—1. In combination with the excavator, the supplemental adjustable caster-wheel H arranged to run upon the bank, substantially as and for the purpose specified.

2. In combination with the excavator, the guide-wheels M M', substantially as and for the purpose specified.

3. The guide-wheels M M' having sharp flanges *m*, in combination with the excavator, substantially as and for the purpose specified.

4. The combination of the scraper and jointed extensible arms L, which are composed of the parts *l1*, *l2*, 2, F, and *l3*, substantially as and for the purposes specified.

137,319.—*Portable Earth-Closet.*—ALFRED PANYARD, Massillon, Ohio. Application filed April 16, 1872.

The deposit-chamber has an inclined seat arranged in connection with a hinged earth-chamber having an inclined bottom, so when the earth-chamber is swung over the seat the deposit-chamber will be sealed, preventing the escape of any odors, and when swung back the bureau or other article of furniture to which it is attached will act as a counterpoise to prevent the overturning of the apparatus by the weight of the earth-chamber and contents. It also consists of the arrangement in the earth-receptacle of a valve provided with a measuring-cavity and perforated discharge-plate.

Claim.—1. The combination of the hinged earth chamber C, deposit-chamber N, and bureau A, or equivalent piece of furniture, the several parts being arranged substantially as specified, so that the bureau or equivalent piece acts as a counterpoise to the earth-chamber when swung open, as is herein set forth.

2. The packing-strip L secured on the inclined bottom J of the earth-chamber C, and acting in combination with the inclined seat D, substantially as is herein specified.

3. The inclined seat D having the packing-ring *d* thereon, in combination with the deposit-vessel E and earth-chamber C, with inclined bottom J and packing-strip L, substantially as is herein specified.

4. The sliding covered or cushioned seat F, in combination with the deposit-chamber N and bureau A, or equivalent piece, said seat being arranged to slide into the part A, substantially as and for the purpose specified.

5. The valve H, provided with the measuring-cavity h and perforated discharge-plate I, arranged between the hopper G and perforated bottom J, and operated by the spring K, substantially as and for the purpose specified.

137,320.—*Rack for Curtain-Fixtures.*—JOSHUA PUSEY, Philadelphia, Pa. Application filed March 13, 1873.

The metallic plate has a longitudinal slot, enlarged at the top, and a series of alternate slots inclining slightly upward and enlarged at their upper ends. The cord-sheave is provided with a shank having a terminal knob.

Claim.—The arrangement of plate A, provided with slots B and C, and the sheave E, or its equivalent, provided with shank L and button K, substantially in the manner and for the purpose set forth.

137,321.—*Sewing-Machine.*—DANIEL H. ROGAN, Newton, Iowa, assignor of one-half his right to ALBERT LUPKIN, same place. Application filed January 3, 1873.

A crank-pin on the outer face of the wheel enters a slot in the upper arm of the pivoted toothed sector, and the sector engages a pinion on, and imparts a reciprocating rotary motion to, the shuttle, which has its delivery-eye at its center. The pin in the shuttle has a hole through it near the little collar fastened thereon; a spiral spring presses the pin in the socket, and the thread is pressed between the collar and the end of the socket.

Claim.—1. The toothed sector C provided with the slotted arm *z* and the wheel M having the crank-pin m^2, combined with the pinion C', rock-shaft *u*, and shuttle having a central thread-delivering eye, all constructed and arranged substantially as shown and described.

2 The combination of the balance-wheel M provided with the cam-groove K, the lever J' having the slotted arm j^3, the lever j^2, link j^1, shaft j^4, and bars J J, constructed and arranged to operate the feed, substantially as and for the purpose described.

3. The combination inside of the shuttle F of the pin *k* having hole *m* and collar, cylinder *m'*, spiral spring *l*, and plate-spring *p*, substantially as described and shown, and for the purpose set forth.

137,322.—*Manufacture of Artificial Stone.*—JAMES L. ROWLAND, Milwaukee, Wis. Application filed November 26, 1872.

Claim.—1. The apparatus, substantially as described, for mingling carbonic-acid gas with vapors of fluids in a chamber containing the material to be indurated, as set forth.

2. The combination, with an indurating-chamber, G, of a carbonic-acid generator and a vapor or steam generator, substantially as described.

3. The combination of a gas and vapor mixing pipe or passage, gas-generator, vapor-generator, and indurating chamber, substantially as described.

137,323.—*Treatment of Lime for the Manufacture of Artificial Stone.*—JAMES L. ROWLAND, Milwaukee, Wis. Application filed November 26, 1872.

Claim.—1. As a means of slaking a lime or hydraulic or common or air lime, and producing a hydrate, the application to the lime of water in very finely-divided particles, as steam or vapors, substantially as set forth.

2. As a means for slaking a hydraulic or common or air lime, and producing a hydrate or subcarbonate hydrate, the application to the lime of carbonic acid, together with or in combination with water, either in its natural state or in any of the forms it is susceptible of taking that are practicable in this process, as steam, vapor, mist, or spray, substantially as set forth.

3. As a means of slaking a hydraulic or common or air lime, and producing a hydrate or subcarbonated hydrate, the application to the lime of water charged or saturated with carbonic acid or holding it in solution, substantially as set forth.

137,324.—*Road-Wagon.*—CYRUS W. SALADEE, St. Catharine's Canada. Application filed December 30, 1872.

Claim.—1. The employment of two sets of slats or perches, the one above the other, rigidly connected at their centers, for the purpose of connecting the rear axle and front bolster of running gear for vehicles, substantially as set forth.

2. The employment of one or more standards, B, between the upper and lower slats or perches B^1 and S, substantially as and for the purpose set forth.

3. The employment of one or more cross-bars, C C', in combination with the upper and lower slats or perches B^1 and S, substantially as and for the purpose set forth.

4. The intermediate slats B B^2, having their rear ends and center portions rigidly secured to the gearing, and their front ends left free to vibrate under the pressure of the feet, substantially as and for the purpose set forth.

5. The dash-board P secured to the spring foot-board U, substantially as and for the purpose set forth.

6. In combination with the under slats or perches S and rear axle T, the short intermediate slats B^3, Fig. 2, as a receptacle for baggage or other articles to be carried, substantially as and for the purpose set forth.

7. The connecting-rod E, Figs. 1 and 2, arms F, and stirrups H, when secured and operated upon the slats or perches at or about midway between the axle and bolster, and combined with the sides of the springs, seat-risers, or seat, substantially as and for the purpose set forth.

8 The foot-board U, composed of slats B, or other equivalent bottom, having its rear end rigidly secured and supported upon the gearing at or near the cross-center between the hind axle and front bolster, and its front end suspended independent of the bolster or other support, substantially as and for the purpose set forth.

9. An independent foot-board, U, composed of slats or other equivalent bottom, rigidly connected and suspended to the bottom of the seat K, the latter being supported upon the springs A^1 by seat-risers J, substantially as and for the purpose set forth.

137,325.—*Means for Detaching Boats.*—THOMAS SHAW, Philadelphia, Pa. Application filed January 9, 1872.

Both ends of the boat are detached at the same time, and the liability of swamping rendered less.

Claim.—The davits, and the ordinary tackle for raising and lowering boats, ropes *c* provided with loops at their extremities, a boat provided with eyebolts *e*, and the coupling or lashing cord adapted to be cut as described, when combined for operation as a boat-detaching apparatus, substantially as herein described.

137,326.—*Combing-Machine.*—ISAAC SMITH, BENJAMIN SMITH, HENRY SMITH, and CHRISTOPHER BRADLEY, Bradford, England. Application filed May 21, 1872.

The object is to effect an additional combing of the material.

Claim.—The improvements in apparatus for combing wool and other fibers of the character described, whereby the outer circle or ring of combs is divided into two rings, with one portion divided into segments capable of movement to and from the other, in manner and for the purposes substantially as described.

137,327.—*Drying Tomatoes.*—MARSHALL P. SMITH, Baltimore, Md. Application filed March 21, 1872.

Part of the water is removed by pressure and the rest by evaporation.

Claim.—The within-described process of drying and preserving raw tomatoes, by submitting them first to pressure to remove a portion of the water which they contain, and then partially or wholly evaporating the residue, substantially as set forth.

137,328.—*Stove-Door Frame.*—SAMUEL SMITH, Philadelphia, Pa. Application filed February 19, 1873.

A series of downwardly-projecting hooks are cast with and on the inner surface of the frame. These hooks pass through suitable orifices in the sheet-iron body of the stove, and, engaging behind their lower edges, hold the frame firmly in place.

Claim.—The hooks or studs *a'*, in combination with the openings *i* in the door-frame A or nozzle B, or in either of them, the same being cast on simultaneously with the casting of the said door-frame or nozzle, substantially as and for the purposes hereinbefore set forth and described.

137,329.—*Wood-Scraper.*—HENRY D. SPICKLER, Canton, Ohio. Application filed December 5, 1872.

Two knives are used in the same stock, one curved and the other straight-edged.

Claim.—The double scraper herein described, consisting of a frame, A, with handles *a a*, in which are secured two knives, D E, with turned or scraping edges *d e*, said knives being arranged back to back, and on opposite sides of the frame A, and one of said knives, D, having a straight, and the other knife, E, a curved edge, substantially as and for the purpose specified.

137,330.—*Generator for Generating Carbonic-Acid Gas.*—JOHN W. STANTON, Brooklyn, N. Y. Application filed November 29, 1872.

Near the top of the generator is arranged one or more series of shelves for supporting the alkaline substance, each shelf having a crank attached to its axis, a pin on which engages in a slot in a sliding bar on the outside of the generator, so that any desired portion of the alkali may be precipitated into the acid solution at the will of the operator. Below the tripping-shelves are arranged breakers, so that if the alkaline substance becomes caked by long standing it will be subdivided in falling.

Claim.—1. In combination with a gas-generating chamber, a series of shelves or supports for holding, in properly-divided quantities, the alkaline substance, substantially as described, and for the purposes set forth.

2. In a carbonic-acid-gas generator, the combination of a receptacle for holding a solution of sulphuric acid and water, with a series of tripping-shelves or their equivalents for sustaining the alkaline materials in controllable quantities, and permitting the dropping of any desired part of the alkaline material into the acid and water at the will of the operator, as described, and for the purpose set forth.

3 The combination, in a carbonic-acid-gas generator, of the mechanism for scattering or disseminating the alkaline materials, substantially as described, with the mechanism for supporting the same in separate quantities, substantially as described, and for the purpose set forth.

4. In combination with the supports for the alkaline substance in a gas-generating chamber, the tripping or tilting devices, substantially as described, and for the purpose set forth.

137,331.—*Pressure-Gage.*—JOHN W. STILES, New York, N. Y. Application filed May 17, 1872.

A hydrostatic balance is arranged in connection with a pressure-rod receiving the pressure from a steam-boiler, in such a manner as to weigh or indicate the amount of the steam-pressure.

Claim.—The combination and arrangement of the steam-piston B and its chamber A with the float E, reservoir F, and weighing-fluid, in the manner and for the purpose substantially as described.

137,332.—*Powder-Flask.*—THOMAS L. STURTEVANT, Framingham, Mass. Application filed February 21, 1873.

Two gates are employed, the inner one of which closes to shut the opening into the flask simultaneously and automatically with the opening of the outer one, which allows the powder intervening between the two to be discharged.

Claim.—The combination, with the charge-tube and lower gate E, of the upper gate I, actuated from or by gate E, to close the top of the charge-tube when said gate E is moved to uncover the passage leading from said tube into the flask, and returned to its normal position by an independent spring, J, so as to uncover the top of the charge-tube when the gate E closes the bottom of the same, substantially as shown and set forth.

137,333.—*Claw-Bar.*—WALTER S. TERHUNE, Ridgewood, N. J., assignor of one fourth of his right to THOMAS ALDRIDGE WESTON, same place. Application filed June 7, 1872.

The fulcrum-block is attached to the bar by pins working in grooves on the sides. The fulcrum-block remains stationary, while the fulcrum is changed as the weight is raised.

Claim.—The segmental sliding fulcrum-block C, in combination with the convex-faced groove *b b* in the heel of the bar A, all constructed as herein shown, for the purpose set forth.

137,334.—*Self-Acting Spinning-Mule.*—GEORGE O. WICKENS, North Andover, Mass. Application filed September 30, 1872.

Relates to the device which, suspended from the counter-faller, seizes at times the belt or cord which turns the screw in the radial arm to regulate the winding. A standard to be attached to the carriage and forming the stationary jaw, has a shaft in its lower end, provided with an inclined groove, into which takes a pin from the weighted lever which forms the movable jaw, so that when the latter is lowered by the fallers it will also move toward the stationary jaw and the cord will be clamped between the two.

Claim.—The device constructed substantially as described, having a fixed jaw and a movable jaw attached to a weighted lever to form a clamp, which is opened and closed by an incline, and operated by the counter-faller, substantially as described.

137,335.—*Friction-Clutch.*—SAMUEL B. ALGER, Oswego, N. Y. Application filed February 8, 1873.

Claim.—1. The hooks *f'* formed on the plate F, and the projections *h'* of the sleeve H, arranged for connecting said plates and sleeve, as specified.

2. The friction-clutch formed by the combination with the shaft A and loose pulley B, provided with the grooved flange *b'* of the pivoted friction-blocks D having their outer edges V-shaped, the center-piece C, adjustable plates K, and plates F, with the sliding hooks *f'*, sleeve H having projections *h'*, and the wedges G, all as shown and described.

3. The wedge-keys G, in combination with the adjustable plates E F of the clutch, substantially as herein shown and described.

137,336.—*Ant-Trap.*—THEODORE G. AMES, Keese, Tex. Application filed January 6, 1873.

Claim.—An ant-trap, consisting of the conical outer vessel *a*, converging toward the top on the inside, and the inner conical vessel *b*, diverging toward the top on the outside, the two being connected by the bottom *d*, as and for the purpose set forth.

137,337.—*Railroad Rail.*—H. GATES ANGLE, Chicago, Ill. Application filed January 18, 1873.

Claim.—The improved rail formed of the wooden stringers, the metal angle-rail D E having the lip H taking into the groove C, and the metal bearing-plate K, all as shown and described.

137,338.—*Expansion-Bolt.*—DAVID L. BARTLETT, Baltimore, Md., assignor to BARTLETT, ROBBINS & Co., same place. Application filed February 20, 1873.

The bolt is composed of two half-sections and a wedge, and its head incloses a nut, into which a screw may, for any purpose, be inserted.

Claim.—1, The longitudinal portions A A of an expanding-bolt, constructed with recesses *g* in them for the purpose of confining therein a nut *g'*, substantially as described.

2. The two halves A A, grooved at *b c*, and otherwise constructed, substantially as described.

137,339.—*Manufacture of Traveling-Bag Frames.*—JAMES B. BLAKELEE and CHARLES F. BLAKELEE, St. Petersburg, Pa. Application filed December 9, 1872.

A strip of sheet metal, wide enough for the two bars and cut to the shape shown, is first bent transversely and then longitudinally, first at the corners and then along the straight portions; it is then split longitudinally, and the lips at the ends bent round to form the knuckles. The bending is effected gradually by a series of dies.

Claim.—1. The method of making the angle-bars for traveling-bag frames, by producing a double angle-bar from a plain flat strip, in the manner described, and separating it along the middle, substantially as specified.

2. The relative arrangement of the ears *n*, eyes *m*, and projections *k* of each part of the bars to hinge them together so that one will close within the other, substantially as specified.

3. Bending-dies *a b f g*, constructed and arranged substantially as shown and described.

4. The combination of the rests E D and the adjustable stop-guide F with the dies A B, substantially as specified.

137,340.—*Wall or Window Washer.*—ELIZABETH N. BRADLEY, Bridgeport, Conn. Application filed January 24, 1873.

A brush constructed with its face and back in two parts. The face portion of it is slotted and perforated, and to which is fitted sponge, cut in form to cover its surface closely and secured to it by cords or wire passing over and through it and through the perforations in the block and confined to the back of it, and the whole covered by the top or cap with an opening for the handle in its center.

Claim.—The combination of the cut sponge B, grooves *b*, holes *c*, and cord or equivalent *d* with rounded wood back A, as described, and for the purpose specified.

137,341.—*Whip-Lash.*—HENRY J. BUSH, Westfield, Mass. Application filed January 16, 1873.

Claim.—A whip-lash composed of a rolled cloth body or swell, *a*, with surrounding even-laid longitudinal threads *c* entirely covering the same, and an exterior cover of braid, *b*, substantially as herein shown and described.

137,342.—*Plaiting Attachment for Sewing-Machines.*—ORANGE M. CHAMBERLAIN, New York, N. Y., assignor of one-half his right to WM. B. CARRINGTON, same place. Application filed November 2, 1872.

The slotted blocks allow the brace which carries the folder to turn on its pivot in the reciprocating block or slide moved by the

connecting-rods F, so as to engage the fabric firmly as the folder is about to be moved forward and release it when about to move back. By the arrangement described in the second clause the plaits are made diagonally across the material, and the material is fed forward in a straight line.

Claim.—1. The slotted blocks S, in combination with the pitman H, folder J, and brace M, for the purpose set forth.

2. The guide K, the folder with the edge inclined to the path traversed by the material, and the feed inclined in a direction opposite the inclination of the folder, all as and for the purpose described.

137,343.—*Box-Plaiting Attachment for Sewing-Machines.*—ORANGE M. CHAMBERLAIN, New York, N. Y., assignor of one-half his right to WM. B. CARRINGTON, same place. Application filed January 22, 1873.

The formers are attached to the shafts *i i'*, which have a reciprocating and rocking motion imparted to them through the pitmen-links and rocking arms. The fabric passes between the former-blades, which move in opposite directions, and each in going forward passes over the other, and one always against the bed-plate and the other against the presser-foot, so as to form the plaits in opposite directions.

Claim.—1. In combination, the pitman L L' and rocking arms F F'', connected, substantially as described, with the formers G G'.

2. The combination of the arms *g g'* with the shafts *i i'*, springs A, and sliding bearings *m m'*, for the purpose described.

3. The combination of the wheels D E F with the adjustable pitman L L', rocking arms F' F'', links S S', arms *g g'*, and formers G G', for the purpose described.

137,344.—*Trimming.*—ORANGE M. CHAMBERLAIN, New York, N. Y., assignor of one-half his right to WM. B. CARRINGTON, same place. Application filed January 20, 1873.

A bias box-plait, formed of a single or double piece of cloth, either with a beading or binding, or without it, and is formed by making the ordinary box-plait at an angle to the edge of the cloth instead of in line with it.

Claim.—As a new article of manufacture, the trimming herein described, formed of bias box-plaits, substantially as shown, and for the purpose set forth.

137,345.—*Fire-Proof Floor.*—NATHANIEL CHENEY, New York, N. Y. Application filed February 8, 1873.

The tension-rods of the brick arches of the fire proof floors are made of wires placed close together and interwoven with cross-wires so as to serve the additional purpose of a metallic lathing upon which to lay the plaster of the subjacent ceiling.

Claim.—The tie-wires D provided with interwoven transverse wires, and suspended, substantially as and for the purpose described.

137,346.—*Presser-Block for Pants.*—LEWIS COHEN and JOHN C. WALLER, San Francisco, Cal. Application filed January 24, 1873.

Two parts of the block are grooved to slide upon each other in a diagonal line, by which the width of the block may be varied. A holder supports the block while the parts are being pressed and shaped upon it.

Claim.—1. The forming-block, consisting of the parts *b c*, said parts being arranged to slide upon each other in a diagonal line, either with or without a tongue-and-groove joint, substantially as and for the purpose above described.

2. The block *b c*, in combination with the block-holder A, substantially as and for the purpose above described.

137,347.—*Rotary Printing-Press.*—CALVERT B. COTTRELL, Westerly, R. I. Application filed February 8, 1873.

A griper attachment to a continuously-revolving cylinder. The gripers are moved forward on the cylinder by cams, and open just before coming to the place for taking the paper, and then fly back against a gage or stop and rest while closing on the paper.

Claim.—1. The combination, with a continuously revolving cylinder printing-press, of gripers having a period of rest relatively to the rotation of the cylinder while closing upon the paper, substantially as specified.

2. The combination, with a continuously-revolving cylinder-press, of gripers having an advance movement and a retrograde movement relatively to the cylinder preparatory to taking the paper, and a period of rest while taking it, substantially as specified.

3. The combination, with the table and the cylinder of a continuously-revolving printing-press, of movable gripers, stationary gage-stops therefor, and springs or other equivalent instrumentalities, in such manner that the gripers are controlled relatively to the table and the paper while taking it by the said gage-stops, substantially as specified.

4. The combination, with the cylinder of a continuously-revolving cylinder-press, of gripers having a period of rest while taking the paper, and a preparatory advance motion after taking it and before their motion with the cylinder is completely established, substantially as specified.

5. The combination, with the gripers and the rock-levers *e*, of the connecting-rods *m* pivoted to the cylinder eccentrically to the rock-levers, and either having the slotted holes and springs or not, substantially as specified.

6. The combination of the rock-levers *e*, stationary cams *i*, springs *j*, gripers, and the cylinder, substantially as specified.

7. The arrangement of the cams relatively to the rock-levers and the stops *q*, as represented at *w*, to begin the advance motion of the gripers preparatory to the completion of it by the stops *s* or other part of the cylinder, substantially as specified.

8. The combination of air-springs with the cylinder and gripers having a period of rest while taking the paper, to cause the gripers to advance after taking the paper before being fully set in motion by the cylinder, substantially as specified.

137,348.—*Bee-Hive.*—AMOS DEWEESE, Oak Mills, Kans. Application filed November 25, 1872.

The doors of the hives are duplex, the inner perforated, the outer close; a space between them and openings at the base; the doors of a row of hives attached to a bar, which bar is operated by a remote bell-crank with counter-weight to slide the doors, said bar also forming the alighting-board for each hive.

Claim.—1. The wire-gauze plates *g*, arranged in a cavity on the inner side of the gates *a* so as to leave a space between them for admission of air, as and for the purpose specified.

2. The bar B, arranged, in connection with the hives A, so as to serve in place of the usual alighting-board, as specified.

137,349.—*Hydraulic Cane-Crusher.*—CHARLES H. DICKINSON, Rosedale, La. Application filed September 28, 1872.

Cylinder provided with sliding grate-bottom, through which juice is forced into a sliding pan. Pan and grate being removed, bagasse falls onto an endless belt, conveying it away.

Claim.—1. The sliding grate H applied at the bottom of a cane-press cylinder, as and for the purpose described.

2. A cylinder for a cane-press provided with holes R for the exit of juice that rises above the piston, a grate-bottom, H, for the escape of the juice that flows in advance of piston, and the intermediate part of cylinder made solid, as described.

3. The sliding pan I arranged beneath the perforated bottom of the cylinder of a cane-crusher, as and for the purpose specified.

4. The endless carrier K applied below the pan I, as and for the purpose described.

137,350.—*Reed-Organ.*—ANTON DREHER, Cleveland, Ohio. Application filed February 8, 1873.

The reed-valves ordinarily employed are extended to cover the mouth of the channels of the upright back set.

Claim.—The combination and arrangement of the reed-board D, the conductors K, the extended valves C, and the board A with the reed-board B, substantially as shown and described, and for the purpose set forth.

137,351.—*Track-Clearer for Harvesters.*—OBIN DU BOIS, San José, Cal. Application filed August 3, 1872.

A bar extends diagonally from the point of the grain-divider to the frame of the machine for the purpose of inclining the grain or grass, and to throw the cut away from that which is uncut.

Claim.—1. The bar or rod D, standing at an angle with the cutters of a mowing or reaping machine, substantially as and for the purpose above described.

2. The sharp edged dividing or separating plate F, with its housing G, in combination with the rod D, substantially as and for the purpose above described.

137,352.—*Expanding Pulley.*—JOSEPH E. FALES, Worcester, Mass., assignor to RICE, BARTON & FALES' MACHINE and IRON COMPANY, same place. Application filed March 6, 1873.

Two sectional, adjustable, and expanding pulleys are arranged upon shafts within the frame, and both are connected by a belt. The pulleys are expanded by means of cones adjustable by set-screws connected with gearing and the sliding frame upon the shafts.

Claim.—1. The combination, with the shafts C D, shells E F, and slotted cones G H, of the expanding pulley-sections I, sliding frame M, screws L, gears 2 3 3, and connecting-rods A, substantially as and for the purposes set forth.

2. The combination, with the shafts C D and shells E F, of the cones G H, expanding pulley-sections I, substantially as and for the purposes set forth.

137,353.—*Collar.*—ANDREW FLATLEY, Brooklyn, N. Y. Application filed January 25, 1873.

Claim.—As a new article of manufacture a turn down collar having each of its lappets inclined or cut away from the center on the inner edge, as described and shown, to form a triangular space above and below the meeting points or centers *a'* when the collar is adjusted for wear, as specified.

137,354.—*Machine for Cutting and Dressing Stone.*—WILLIAM A. FORMAN, Genesco, N. Y., assignor of one-half his right to WILLIAM H. KELSEY, same place. Application filed March 10, 1873.

The loaded wheel connected by belting with a driving-wheel and a bar having attached thereto an operating-tool, actuated by vibration evolved from said loaded wheel when in rapid motion.

Claim.—A loaded wheel, F, in combination with a driving-wheel, G, connected by belting, and a bar, having attached thereto an operating-tool actuated by the vibration of the parts, substantially as herein recited.

137,355.—*Reservoir Cooking-Stove.*—SIMON W. FRANCK, Brooklyn, N. Y. Application filed September 7, 1872.

Claim.—1. The extension attachment to a cooking-stove for supporting a boiler or hot-water reservoir, provided with the channel E, dampers F and G, and escape-flue H, all constructed, combined, and arranged to operate substantially as described.

2. In combination with said channel E, dampers F and G, and escape-flue H, the partitions or collectors M M, as and for the purpose set forth.

3. In a boiler or hot-water reservoir for a cooking-stove, the combination of the smoke-flue B with transverse water-tubes C passing through the boiler or reservoir and the side smoke-flues H, with dampers so arranged that the smoke and heated products of combustion may be made to pass off through either of said smoke-flues by turning the dampers, substantially as described.

137,356.—*Wardrobe Bedstead.*—RICHARD W. FROST, New York, N. Y. Application filed February 8, 1873.

The mattress is divided into two sections, which are hinged together by a block let into notches in the side pieces of the frame and two jointed bars, forming two joints, which are distant from each other about the thickness of the part of the mattress above the frame, which allows the two parts to fold closely, so as to be folded in the case or wardrobe.

Claim.—The combination of case A, block F, jointed bars H I, and notches G with a folding mattress, as and for the purpose described.

137,357.—*Feeder and Filter for Boilers.*—JOHN G. FULTON, Toledo, Ohio. Application filed December 31, 1872.

A flexible pipe, provided with floats, located in a tank supplied with live and exhaust steam conveys the water from a point just below the level of the water to the boiler, &c. A revolvable sediment stirrer and remover is attached to the tank.

Claim.—1. The feed-water supply-tank A, in combination with the flexible or movable discharge-pipe F and the floats *a*, for the purpose of drawing the water from a point below the level of its surface, as set forth.

2. The stirring device E *a b*, in combination with the bottom of the tank A, having a sediment discharge-pipe, as specified.

3. The arrangement of pipe D and heating-pipe C with the feed-water tank A and the flexible pipe F, and stirrer E, as set forth.

137,358.—*Machine for Cutting Cam-Grooves.*—JOHN S. GEORGE and WILLIAM HOUGHTALING, Bridgeport, Conn. Application filed August 12, 1872.

Cams are connected with spindle and partake with it longitudinal movement imparted by fixed stub, projecting into the groove of cam. Cam F, through the medium of the rack-bar and a stud upon it, imparts rotary motion to the tool-holder *d* in such manner as at all times to preserve the cutting-edge of the tool at right angles to the wall of the groove that is being cut.

Claim.—1. The combination of the spindle C, the cams G and F, the rack-bar I, studs J and O, a carriage, D, substantially as described.

2. The combination of the cutting-tool *e*, tool-holder *d*, pinion *a*, rack *b*, and bar I with the carriage D and its adjusting-screw, substantially as described.

137,359.—*Propelling Vessels.*—SOLOMON GERHARD, Camden, N. J. Application filed June 8, 1872.

Arms having paddles on their outer ends, and vibrating on pins, are caused to slide horizontally by a double crank-shaft situated between and connected to the arms so as to raise and lower the paddles alternately.

Claim.—The arms D D' having paddles at their outer ends and vibrating on pins *b b'*, which slide horizontally, in combination with a double crank-shaft, A, situated between the two arms and connected directly thereto, so as to raise and lower the paddles alternately, as set forth.

137,360.—*Machine for Covering Cord.*—JOSEPH E. GILLESPIE, Norwich, and TOBIAS KOHN, Hartford, Conn.; said GILLESPIE assignor to said KOHN. Application filed January 31, 1873.

The rib and guide serve to conduct the covering-strands properly to the cord to be covered, and whether they be drawn from the upper or lower end of the spools. The core is inclosed with the cord by the covering-strands, but is withdrawn as the finished cord is led away, leaving the same soft and flexible.

Claim.—1. The circular raised rib C' upon the revolving bobbin-plate C over which the threads pass, substantially as and for the purpose herein described.

2. The guide G for conducting the covering-threads upon the cord, and through which the finished cord passes upward, when provided with adjusting-screws and combined with the frame, substantially as herein described.

3. The central core H, in combination with a cord-covering mechanism, substantially as and for the purpose herein described.

4. The combination of the rib C' and the guide G with a series of bobbins, substantially as herein described.

137,361.—*Oiler.*—CYRUS E. GRANDY and ZIBA B. GRANDY, Stafford Springs, Conn., assignors to themselves and WILLIAM D. HEALD, same place. Application filed February 21, 1873.

Oil enters the tube through openings in the main or exterior tube, and is ejected through the nozzle by means of the spring mechanism connected to the piston. The end of the nozzle is provided with a cover, which also serves as a cleaning-tool of parts to be lubricated.

Claim.—1. In combination with an oiler, a cover and spoon, substantially as and for the purposes described.

2. An oiler consisting of the vessel A, tubes D and F, lever G, orifices *e e*, plunger-rod J, and spring M, when arranged to operate as and for the purposes described.

137,362.—*Scarf-Ring.*—JOHN HAACK, Hoboken, N. J., and SAINTEMME DIOLOT, New York, N. Y. Application filed March 8, 1873.

The pin or tongue of the buckle passes through a perforation in the ring and pierces the scarf within. The side projections serve as a spring-fastening to hold the buckle securely in place when closed upon the ring.

Claim.—The ring A, in combination with the buckle B, consisting of wire pivot *a*, pin *d*, and side projections *e*, substantially as and for the purpose described.

137,363.—*Lifting-Jack.*—JAMES S. HALLEMAN, Kansas City, Mo., assignor to himself and HARRY E. CLARK, same place. Application filed October 5, 1872.

In lowering a weight, the lever F is arranged in the same way as for lifting, and the bar is raised slightly until the pawl is raised out of the teeth. The bar is then allowed to move down gently the space of one tooth, and so on, the bar and supported weight being lowered a tooth at a time.

Claim.—1. An improved lifting-jack, composed of the foot-plate A, pivoted and slotted bars B, toothed bar C provided with a shoulder or step, D, the lever F, pivoted loop or stirrup G, and pawl H, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purposes set forth.

2. The combination of the hook *h'* and loop J with the pawl H and loop G, substantially as herein shown and described, and for the purpose set forth.

137,364.—*Millstone-Dressing Machine.*—JOHN B. HARRIS, Ottawa, Ill. Application filed February 10, 1873.

The base, consisting of two parallel ways in which a frame works, having a feeding device working across the base and a pick attached to said frame.

Claim.—1. The feeding device, consisting of the following parts: The frame C, feed-screw *d*, lever *g*, slide *i*, guide-rod A, and the rest *m*, in combination with the pick K and the handle J, substantially as described.

2. The pick K and handle J in combination with the resting-block P and the feeding device, constructed and operated substantially as described.

137,365.—*Screw-Propeller.*—JOHN HARTMAN, Jr., Philadelphia, Pa. Application filed July 12, 1872.

A propeller-shaft has an inclination from the perpendicular, and passes through and is journaled in a solid rudder-frame, the top of said frame supporting a sleeve and attached bevel-gear, which gear meshes into similar bevel-wheel fixed on the upper end of propeller-shaft, and gives motion to said shaft. A worm and worm-wheel revolve the rudder-frame and shaft, while the vessel is under way, to steer the same.

Claim.—The combination of the propeller-shaft H with the main stock D, worm L, worm-wheel L', rudder E, and outboard-bearing I, substantially in the manner and for the purpose set forth.

137,366.—*Blast-Furnace.*—DAVID W. HENDRICKSON, Red Bank, N. J. Application filed October 7, 1872.

The draft induced in the flues by the steam-jets causes the air-blast of the furnace to enter at the top and pass through the charge, escaping by the tuyeres; and the form of the steam-jet gives a strong draft and prevents the formation of eddies in the flue.

Claim.—1. The combination, as shown in the accompanying drawing, furnace A, boiler B, steam-pipes N, nozzle P, flues C, and tuyeres E E' E'' E''', substantially as and for the purposes hereinbefore set forth.

2. The nozzle or covering P for pipe or pipes N, or plurality of jets of steam, substantially as and for the purposes hereinbefore set forth.

137,367.—*Door-Spring.*—LEONARD J. HIGGINS, Mount Desert, Me. Application filed January 11, 1873.

A semicircular case, containing a shank and spiral spring, is attached to the casing. The upper end of the shaft forms a lever-wheel, which is mortised or notched. In the notches of this wheel one end of a lever is detachably supported, passing out through the slotted case, and the other end of the lever, terminating in a friction-roll, presses upon and traverses a longitudinal track on the door or gate, the tension of the spring to prevent slamming being readily adjusted by slipping the detachable end of the lever in the series of notches provided for it.

Claim.—The lever I, one end carrying friction-roll K, resting against door L, and the other passing through a transversely-slotted case, C H, and supported detachably in one of the mortises J of a wheel, E, as and for the purpose described.

137,368.—*Basket.*—WILLIAM C. HIGGINS, North Blandford, Mass. Application filed February 15, 1873.

The basket has outer and inner vertical stays arranged opposite each other, and secured together by rivets passing through them and the hoops. To the bottom a cross-piece or foundation is fitted, and is riveted to the vertical stays that pass across the bottom of the basket.

Claim.—1. A basket having outer stays B and inner stays B', arranged substantially as shown and described.

2. In combination with a basket having stays B B', the bottom cross G, substantially as shown and described.

137,369.—*Churn.*—HENRY A. HINCHERS, Hustonville, Ky. Application filed July 27, 1872.

A bottomless cylinder within the churn, concentric thereto, is laterally perforated through its whole length, and descends nearly to the bottom of the churn proper. There are three dome-shaped dashers on one stem, the lowest nearly of the same area as the cylinder; the second smaller, and the third still smaller, the first and second being perforated. A warm or cold water jacket surrounds the whole, having a thermometer attachment at one side.

Claim.—The conical cover B, perforated cylinder C, dasher D E F G, and cover H, in combination with each other, to adapt them for attachment to a churn-body, substantially as herein shown and described, and for the purpose set forth.

137,370.—*Bean-Harvester.*—JACOB HINDS, Hindsburg, N. Y. Application filed February 15, 1873.

Two severing-knives are hinged to the inner sides of sled-runners, and held in a horizontal position for cutting and accumulating by the draft power, and dumped by stopping and allowing the knives to turn downward to a vertical position.

Claim.—The hinged plates or cutters, secured to a suitable frame, and arranged to operate substantially as set forth.

137,371.—*Extension Trough for Wagons.*—ANTHONY ISKE, Lancaster, Pa., assignor to MARTIN L. HERR, same place. Application filed February 7, 1873.

Claim.—The combination of sections 1, 2, 3, and 4, when constructed with bands H III, so as to embrace the sliding segments, which can be drawn out against stops to form a continuous open trough, or slid into each other and suspended to the end-gate by chains, the whole arranged as herein described, for the purpose set forth.

137,372.—*Rock-Drilling Machine.*—FERDINAND JOHNSON, Toledo, Ohio. Application filed February 8, 1873.

The drill is connected with a spring-lever above the gear-wheel, which gives the turning motion to the drill, and the rapid succession of strokes is effected by the alternate action of the cylindrical and grooved parts of the rollers.

Claim.—1. Spring C and cylindrical spring-rest E having projection *m* and pin *n*, in connection with the slotted ring-lever F and drill D, substantially as set forth.

2. The combination, with the spring C, spring-rest E, projection *m*, pin *n*, ring-lever T, and drill D, of the guide-hooks K, platform-wheel *f*, casing *e*, pinion *i*, shaft *h*, and crank *g*, to impart turning motion to said drill, as described.

3. The grooved guide-rollers G, with adjustable T-slides or cog-wheel arrangement, in connection with drill D, for raising and lowering the same, as specified.

4. The combination of the cog-wheels *o* and *w* and lever *p* with the guide-rollers G, adjustable T-slides, and drill D, for imparting the stroke and turn motion to said drill, substantially as and for the purpose described.

137,373.—*Adjustable Bit.*—FREDERICK JONAS, Burlington, Iowa, assignor of one-half his right to GEORGE O. RAY, same place. Application filed August 17, 1872.

The bit and counterboring-tool are both held in position by a single set-screw.

Claim.—In combination with the stock A, the bits B and G, when each bit is made independently adjustable of, or with relation to, each other, by means of the collar D and set-screw E, substantially as and for the purpose specified.

137,374.—*Adjusting Attachment to Reversing-Levers, &c.*—GEORGE W. JORDAN, Passaic, N. J. Application filed January 18, 1873.

A worm-wheel, operated by a vertical shaft and hand-wheel, shifts, adjusts, and holds the throttle-valve lever. The worm-wheel engages with a toothed segmental bar, from which it is disengaged by the ordinary spring-catch lever.

Claim.—The combination, with the lever A, sliding bar E, and the curved holding-bar D, of a worm-wheel and a toothed face on the bar D, the said worm-wheel having devices for turning it arranged relatively to the lever A, substantially as specified.

137,375.—*Process for Separating Gold and Silver from Base Metals.*—ERICK LUNDQUIST, Grass Valley, Cal: Application filed September 25, 1872.

Reduced bullion to a molten state in a reverberatory furnace, and adds any ordinary oxidizing agent, (nitrate of soda, saltpeter, &c.,) and stirs well until the oxidation is complete; then, previous to smelting, removes the oxidized mass into a bath of hot or cold water and washes out the oxidizing agent; dries the metal after washing, and smelts.

Claim.—The process above described for separating the base metals from gold and silver, or either of these metals.

137,376.—*Blacking-Brush.*—CHARLES W. MAGUIRE, Brooklyn, N. Y. Application filed October 19, 1872.

A blacking or shoe brush, with a distributing-brush attached or confined to the handle. Both handle and brush are held in their positions by a dovetail and slot or groove, by which either the brush or handle can be removed at will, but is firmly held when in use.

Claim.—A blacking-brush having the supply-brush A, polisher B, and handle C, jointed together by dovetail tongue and groove, in the manner and for the purpose described.

137,377.—*Upright-Piano Action.*—GEORGE C. MANNER, Mott Haven, N. Y. Application filed December 9, 1872.

Arrangement of hammer and rebound cushion with the main lever of the French action on which the key operates.

Claim.—The lever B pivoted at *b*, the rebound cushion F, the hammer E, and pivoted elbow-lever D, all arranged with respect to the damper-lifter I and rod *a*, as shown and described.

137,378.—*Drill-Jar.*—ROBERT MCMULLEN, Titusville, Pa. Application filed October 19, 1872.

The tapering shoulders distribute the shock more equably over the tool and lessen the liability of fracture.

Claim.—A jarring-tool having the links A formed with tapering or wedge-shaped shoulders *d* and E and re-enforce F, substantially as and for the purpose set forth.

137,379.—*Fire-Extinguisher.*—JOHN C. MEEHAN, Springfield, Mass. Application filed December 31, 1872.

If a fire should take place, a tube filled with explosive material is burst by a fuse connecting therewith, thus releasing a lever operating a valve, which permits fluid, &c, in the vessel, to be injected into building.

Claim.—In combination with a valve and releasing apparatus as above described, the cap C and nozzles D, substantially as specified.

137,380.—*Combined Bureau, Wash-Stand, and Wardrobe.*—THOMAS W. MOORE, New York, N. Y., assignor to FANNIE N. MOORE, same place. Application filed January 18, 1873.

A wardrobe of ordinary form and construction, connected to or with a wash-stand, arranged with brackets and places for all the implements appertaining, and having draws in the usual form formed in bureaus for clothing, &c.

Claim.—The bureau, wardrobe, and wash-stand, embraced in one article, and respectively arranged as and for the purpose described.

137,381.—*Gun-Lock.*—WALTER J. MORRIS, New York, N. Y. Application filed February 1, 1873.

Peculiar construction whereby the mechanism is protected from the entrance of dirt, &c.

Claim.—1. The lock-case having a cover, A, combined with a hammer having an arm, K, and slot D, as and for the purpose described.

2. In a gun-lock having the cover A, the arm K having the pointed nose-piece *m*, as and for the purpose set forth.

137,382.—*Nut-Lock.*—ISRAEL E. NAGLE, New Orleans, La. Application filed January 21, 1873.

Claim.—The combination of the lock-washer B having a tongue, *b'*, with the bolt A having its shank faced or grooved to form a bearing for said tongue and the nut C, when constructed and arranged substantially as described and shown.

137,383.—*Window-Mirror.*—ALFRED OLANDER, Glen Gardner, N. J., and ALBERT OLANDER, New York, N. Y. Application filed March 1, 1873.

A double mirror mounted on vertical pivots at the center, and to turn about a quarter of a revolution, and connected by a bell-crank with a pull-piece inside of the room. In the space between the two mirrors a spring is arranged, acting on one or both of the pivots; and to hold the mirrors against the action of the spring the pull-piece has ratchet-notches that engage with a catch.

Claim.—1. The combination of a double mirror, A, pivoted as described, a spring, E, and pull-piece I, when attached to a house, and the said spring and pull-piece arranged for actuating the mirror in opposite directions, as specified.

2. The combination of pull-piece I, ratchet bar H, and catch L, with the pivoted mirror A and its spring E, as specified.

137,384.—*Machine for Cutting Hoops.*—AUGUSTUS G. PARKHURST, Appleton, Wis. Application filed October 7, 1871.

The hoops or bands for forming cylindrical boxes are cut from a stock, and the ends are beveled at the same time to form the lap.

Claim.—1. The combination and arrangement of the adjustable knives M M and the knife J, substantially as and for the purposes described.

2. The adjustable pieces N N, in combination with the beveling-knives M M, for the purposes described.

137,385.—*Box.*—ELIAS C. PATTERSON, Rochester, N. Y. Application filed January 10, 1873.

The box has two lids hinged at opposite sides and fastened together on the top by a hook passing through a staple on the lower lid and engaging with the edge of the upper lid.

Claim.—A paper or wood cigar or other box having a lid in two sections, A and B, section B of any length or width, and section A of any width, and fastener F, consisting of the hook H, shank *k*, and staple *e*, substantially as herein described.

137,386.—*Self-Acting Spinning-Jack.*—ARCHIBALD PAUL, Cohoes, N. Y. Application filed July 19, 1871.

For controlling the backing-off cones, so that they shall go gradually into contact.

Claim.—In a self-acting spinning-jack, the combination of the cam U, cam-bearing *s*, and flange T with the wheel or disk O, or their described equivalents, and the backing-off friction-clutch, substantially as herein set forth.

137,387.—*Trunk.*—DANIEL POMEROY, Green Point, N. Y. Application filed September 13, 1872.

A single screw secures the pad and the front plate together and allows the last two to change their relative positions to each other and to the belt. The pad is provided with two slots in form of an arc of a circle, into which the fastening-pins upon the end of the straps are inserted. The truss serves as right or left hand by simply turning it over. The pad is turned to position and secured by the set screw, and the reverse buckle allows the thigh-strap to serve upon either side at will.

Claim.—1. The pad and pad-plate, rotating upon a single screw independently of each other and of the interposed end of the belt, so that both may be adjusted to and secured in any required position with reference to the interposed belt and to each other, for the purpose of making the truss reversible for either side, substantially as described.

2. The reversible buckle for the thigh-strap, in combination with the rotating pad and plate, and with the belt and thigh-strap, for the purpose of making a reversible truss, substantially as set forth.

3. The slots *c* and *c'* in the rotating plate A, in form of an arc of a circle, as described, and for the purpose specified.

137,388.—*Railroad Water-Tank.*—JOHN L. SHAW, Grand Rapids, Mich. Application filed February 17, 1873.

The tank for supplying locomotive-tenders with water is made by combining a spring with the fixed and movable sections of the discharge or supply pipe, and a jointed bar connecting said sections; said spring being so arranged that when the connection between the two pipes is broken for arresting the discharge of the water it shall remain inoperative; but when the pipes abut or are in contact with each other it will be brought into action by the weight of the delivery-pipe and caused to exert a pressure against the delivery-pipe for forcing the latter in contact with the fixed discharge-pipe, thus insuring, in connection with a projecting India-rubber packing-ring, a water-tight joint. Also, there is arranged, in relation to a discharge-aperture in the water-tank, a means of locking and closing, as well as opening, the valve by a lever, elbow-crank, and bolt.

Claim.—1. In combination with the fixed and movable sections of the supply-pipe, the hinged connecting-bar D and the spring F, or their equivalent, constructed and arranged for operation essentially as described.

2. In railway feed-water-tank pipes, the hollow protruding rubber mouth of the movable section C, arranged to slide upon the conical portion or nipple I of the other section B, to close the joint when the hinge of said sections is arranged as described.

3. The combination of the locking-bolt G, elbow-crank P, pivoted handle Q, and hinged valve O with the water-tank A and connecting-pipe sections B C, substantially as herein described.

4. In railway feed-water tanks having fixed and movable pipe-sections connected by a hinged bar, as described, the said connecting-bar D and the socket into which it fits made to hold the section C from swiveling upon its connecting-bar, as and for the purpose set forth.

137,389.—*Horse Hay-Rake.*—RICHARD B. SHELDON, Canastota, N. Y. Application filed January 11, 1873.

The rake-head, which is also the axle, turns in a semicircular T-shaped tongue and groove, one part of which is attached to the axle and the other to the thill-frame, which permits of detachment by turning the axle a whole revolution.

Claim.—1. The pivoted pawls, consisting of tooth H, block I, and spring J, in combination with the ratchet-wheels G attached to the hubs of the wheels C, and with the axle of a horse hay-rake, substantially as herein shown and described, and for the purpose set forth.

2. The hinge formed of the semicircular T-grooved piece E, and the semicircular T-flanged piece F, in combination with the axle and thills of a horse hay-rake, substantially as herein shown and described, and for the purposes set forth.

3. The combination of the extension-rods L, pivoted lever O, slotted and curved angle-lever P, and hand-lever Q with the pawl mechanism, consisting of tooth H, block I, and spring J to throw the latter into gear with the ratchet-wheels G of the wheels C, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the outwardly-projecting branch or arm o^2 and curved or inclined plate S with the lever O, extension-rods L, and pawl mechanism, consisting of tooth H, block I, and spring J to throw the latter out of gear with the ratchet-wheels G of the wheels C automatically, substantially as herein shown and described.

5. The combination of the slotted rigid arm T, lever U, pivoted connecting-bars W, and slotted rigid arm V with the axle A, to which the rake-teeth B are attached, substantially as herein shown and described, and for the purposes set forth.

137,390.—*Apparatus for Supplying Salt to Cattle.*—FREDERICK STAMBERGER, Clarion, Ill. Application filed February 28, 1873.

A cylinder for containing salt is mounted upon a vertical shaft in the center of a shallow feed trough or platform, the lower edge of the receptacle revolving close to the platform as the cattle lick the salt away. A conical cap protects the contents of the cylinder.

Claim.—1. The combination of the feeding-table and the central revolving cylinder, substantially as described.

2. The table A, shaft B, collar *b*, and cylinder C with cap E, combined and arranged as described, for the purpose set forth.

137,391.—*Locking Device for a Series of Drawers.*—CASPAR A. SPOCK, New York, N. Y. Application filed January 20, 1873.

To the back of the bureau is attached a vertical bar, to which are attached latches to engage with catches on the rear end of each drawer, except the top one. Attached to each latch is a spring to hold said latch in position. To the top of the vertical bar is attached a lever, which bears against the top drawer when it is pushed in, and as the top of the lever is carried to the back of the case it raises the vertical bar and latches the lower drawers. When the top drawer is drawn out the lever is released, the bar descends by its own weight, and releases all the latches.

Claim.—1. The vertical bar C, which by its own weight disengages the latches *c*, as shown and described.

2. The latches *c*, suspended from the vertical bar C, in combination with the springs *a*, as and for the purpose described.

3. The vertical bar C, having the lever *b*, latches *c*, and springs *a*, in combination with the staples *d*, as and for the purpose set forth.

137,392.—*Magazine-Gun.*—ALFRED SWINGLE, San Francisco, Cal., assignor to himself and FRANK A. HUNTINGTON, same place. Application filed November 26, 1871.

Carrier-block provided with grooves, caused to reciprocate vertically by sliding rod operated by the lever-guard. Said rod also carries a spring-hook, which acts as an extractor; also a projecting stud, which acts in a cam-groove in the brush-plug to turn and loosen the same so that the carrier-block may be moved. Also, a safety arrangement for locking the hammer at full or less than full cock, as may be desired.

Claim.—1. The breech-block E, provided with the diagonal grooves *g g'* and horizontal grooves A A', in combination with the horizontally-moving pin *p*, substantially as and for the purpose set forth.

2. The switch-bar *i* having the tripping-horns *j*, in combination with the breech-block E having the diagonal grooves *g g'* and horizontal grooves A A', substantially as and for the purpose set forth.

3. The horizontal sliding bar N, provided with the pin *p*, claw *q*, and arm V with its pin *w*, in combination with the trigger-guard K with its arm M, substantially as and for the purpose above described.

4. The cylinder S having an enlarged screw-head, *t*, and having the cam-groove U in combination with the stud W operated by means of the slide, substantially as and for the purpose specified.

5. In combination with the hammer X, the pin Y, with its shoulder, in combination with the ledge Z' having a recess, Z, arranged to be depressed by the act of cocking the gun, substantially as described.

137,393.—*Dynamometer-Pulley.*—ISAAC P. TICE, New York, N. Y. Application filed March 3, 1873.

Two pulleys are adjusted to a determined resistance, one by the party leasing power, the other by the tenant, each furnishing a check upon the other.

Claim.—1. I claim the combination of the belt-pulley and its threaded hub A, friction-disk C, springs *b b b b*, spider D, bolts *c c c*, flanged nut *f*, driving-shaft B, and friction-blocks *a a a a*, as shown and described, for the purpose set forth.

2. I claim the friction devices and the pulley, excepting its face, inclosed by the heads E E', secured by the bolts and seal-nuts *e e'*, in combination with the heads E E', as shown.

3. I claim two pulleys with adjustable friction devices, in combination with a driving-belt, for the purpose described.

137,394.—*Exercising-Machine.*—LEONARD D. TICE, New York, N. Y. Application filed January 28, 1873.

A device representing an oar-lock, provided with an operating-lever, is employed in connection with band-wheels and friction-clutches, arranged so as to furnish resistance in the movement similar to that found in the operation of rowing.

Claim.—In combination with an oar-lock, c, shaft A, and an operating-lever, *d*, the friction-clutches *k*, wheels B and C, pulleys *a b*, brakes *f e*, and belt *g*, all arranged substantially as described, and for the purpose set forth.

137,395.—*Nut.*—WILLIAM VAN ANDEN, Poughkeepsie, N. Y. Application filed February 21, 1873.

The blank, a little longer than the nut required, is cut from a rod previously twisted, to give a spiral direction to the fibers. It is afterward heated, flattened, punched, and screw-threaded.

Claim.—Nuts in which the fiber of the iron is coiled spirally to the axis of the hole, substantially as specified.

137,396.—*Process for Removing Paper from Walls.*—CATHARINE F. WARE, San Francisco, Cal. Application filed January 6, 1873.

Saturated steam is introduced into the rooms until the paper is thoroughly moistened and limp.

Claim.—The process above described for saturating wall-paper preparatory to removing it from the walls of a room.

137,397.—*Strap for Street-Cars.*—MAHLON WARNE, Philadelphia, Pa. Application filed January 18, 1873.

Hand-support, for passengers compelled to stand in street or other railway cars or omnibuses, so constructed that it shall also serve as an advertising medium.

Claim.—An improved hand-support for passenger-cars, formed of the frame B, connected to the strap D on the rail A by means of a swivel-joint, E, and the strap F, attached to the pins G at the sides of the frame, as specified.

137,398.—*Bed-Bottom.*—ALBERT S. WELLS, New Britain, Conn. Application filed March 10, 1873.

A bed-bottom made of diamond-shaped plates of metal, linked together and attached to the end bars with springs.

Claim.—1. A bed-bottom made from diamond-shaped plates of sheet metal, when pivoted together in the manner described.

2. The springs *c*, plates *i*, and links *e*, when combined to operate as set forth.

137,399.—*Stop for Water-Main Attachments.*—WILLIAM YOUNG, Easton, Pa. Application filed February 8, 1873.

The pipe-connection attached to the main consists of two sections coupled together by a union with a disk of glass, or any substance that will break readily by a crushing force, and packing washers between the two sections, which will stop the water until the connection is made and then let it flow by screwing up one section against the other hard enough to break the glass.

Claim.—A temporary stop for pipes to be attached to water-mains under pressure, consisting of two sections, A B, a union, D, glass or equivalent disk E, and packing-washers, combined substantially as specified.

137,400.—*Guard for Door-Knobs.*—HERRMANN AHRENDT, Newark, N. J. Application filed November 22, 1872.

Within a rosette is arranged a notched and flanged nut, through which passes the spindle of a door-knob, said nut operating in connection with a swinging dog and one or more tumblers

for locking the spindle, the tumblers and dog being actuated from without the rosette, through a hole in its edge, by means of a suitable key. Combined with the swinging dog and tumblers is a catch pivoted in the rosette, so that its free end can be made to swing across an opening formed in the rosette to receive a stud that projects from the cover for the purpose of locking the cover to the rosette.

Claim.—1. The swinging dog J and tumblers T, in combination with the notched nut F, inclosed in the rosette B of a door-knob, substantially as described.

2. The combination of the dog J and tumblers T with the catch K and stud L of the cover of the rosette, substantially as described.

137,401.—*Nut-Lock.*—MARTIN L. BALLARD, Canton, Ohio. Application filed February 26, 1873.

The divided spring-ring is cut away to prevent contact with the nut at that point, thereby avoiding a tendency to open the ring when the nut is unscrewed.

Claim.—In combination with a bolt or rod and its screw-nut, the split, threaded, and spring ring C with its cut-away portion *c*, for forming a nut-lock, as and for the purpose described.

137,402.—*Saw-Handle.*—MARTIN L. BALLARD, Canton, Ohio, assignor to BALLARD, FAST & Co., same place. Application filed March 10, 1873.

The attachment is such that the handle may be quickly disconnected from the saw when desired.

Claim.—A saw-handle or handle-holder composed of the socket A, arms B, vertical screw-bolt or piece C, and projections *a*, *c*, and *e*, taking into or bearing against the saw-plate, the whole constructed and operating substantially as and for the purpose described.

137,403.—*Machine for Making Plaited Capsules.*—JEAN JOSEPH BARAKOWSKI, London, England, assignor to DAVID HUNTER BRANDON, Paris, France. Application filed January 3, 1873.

Claim.—1. The combination of the grooved cone *a* with a ring of articulated blades, *b*, operating to form the plaits successively, substantially as described.

2. A rotating star-wheel, *p*, for successively raising the said blades *b*, as above described.

3. The self-acting clip *q*, for maintaining each blade *b* closed on its plait on its being raised by one of the arms of the star-wheel.

4. The general arrangement of parts *n*, *m*, *o o*, *l l*, *a'*, and *c'*, for imparting the requisite motion to the machine.

137,404.—*Channeling and Edging Tool.*—LOUIS BAUER, San Francisco, Cal. Application filed February 24, 1873.

The converging sides of the bifurcated shank are provided with cutting-edges for rounding the sole-edge of the boot or shoe. A channeler-knife passes through a slot in the shank, and is transversely and vertically adjustable by means of a set-screw.

Claim.—The combined channeling and edging tool, consisting of the handle A, shank B, flattened portion *d* with its V-shaped edging-blades, and having the rib or projection C and opening *f*, in combination with the bar *p* with its knife-holder *r* and set-screws *s n*, steadied by the pin *o*, substantially as and for the purposes above described.

137,405.—*Curtain-Fixture.*—GEORGE W. BEERS, Bridgeport, Conn. Application filed September 7, 1872.

The pawl is arranged in an encircling groove on the bracket, and engages with either of the square sides of the projecting end of the barrel or shaft. A spiral spring is arranged around the pivot of the pawl, and holds said pawl in engagement with the square end of the barrel; the pawl is released by a cord which is attached to its lever end.

Claim.—The curtain-fixture B, circularly and horizontally grooved at *a*, to receive the hook-shaped dog *c*, and provided with the seated spiral spring *s*, the curtain barrel A having the square end *g* and flange *x*, as shown and described.

137,406.—*Revolving Attachment for Gas-Burners.*—JACKSON O. BELKNAP, Mobile, Ala. Application filed February 20, 1873.

A metallic frame, placed over a gas-jet or lamp, holds pictures, colored plates, &c., and is connected, by suitable arms, with a fan-wheel, which is revolved by the ascending current of air. The shaft of the wheel rests upon a slip of glass. The fans or flags may be reversed: The reflectors above the frame revolve in the opposite direction.

Claim.—1. A metallic frame, constructed substantially as shown, and adapted to hold pictures, colored plates, &c., said frame to be revolved around the light by the heated air arising from the lamp or gas-jet acting upon the reversible fans or flags A and B, as shown and described.

2. The combination of a series of revolving fans or flags and cones, fixed and reversible, marked A B, connected with shaft C, loop, metal and glass plates, and screw D, reflector I, arms G, circle H, zones or pictures F, with the use of stained glass, gelatine-board, isinglass, and diaphane, all of which are detachable and interchangeable, each part, as shown by the drawing, arranged one above the other, both of which revolve in opposite directions at one and the same time, substantially as and for the purposes hereinbefore set forth.

137,407.—*Feeding Device for Punching-Machines.*—WILLIAM B. BERRETT, Philadelphia, Pa. Application filed January 8, 1873.

A table having parallel ways; a feed-screw extending diagonally between, and from one end of the ways to the other; a carriage movable on said ways, and connected to the screw by a nut that projects from the former up through the latter and into a straight slot in a plate connected to, and that is horizontally adjustable on, the surface of the carriage. Thus, if at starting the plate be set with its slot directed toward any point that is not midway between a perpendicular drawn from the screw, and another drawn from the ways, the motion of the carriage will be accelerated or retarded corresponding to the direction and obliquity of the slot, the whole extent of which the nut must necessarily traverse in its movement from one end of the screw to the other.

Claim.—1. A feeding device, consisting of a slide controlled by a diagonal screw through the intervention of a slotted plate annularly adjustable on the said slide, all substantially as and for the purpose herein set forth.

2. The combination of the carriage D, controlled by the diagonal screw G through the intervention of the annularly-adjustable slotted plate K, with the short slides E E.

3. The combination of the said short slides E with their adjustable saddles.

137,408.—*Chain-Machine.*—GEORGE W. BINNIX, Sunbury, Pa. Application filed February 10, 1873.

A reciprocating cross-head carrying vertical bending-rollers, whose journals work in elongated slots, bends the blank over a stationary former. Side rolls work against the bending-rollers near the end of the stroke to force them inward and press the ends of the blank. The finished blank is removed by a bifurcated lever operated by a rod connecting with the cross-head.

Claim.—1. The combination, as hereinbefore described, of the cross-head D, the bending-rollers H, supported by the journals A within elongated slots formed in said cross-head, the former I, and the stationary compression-rolls K, substantially as and for the purpose specified.

2. In combination with the cross-head D and former or swage I, the pivoted bar L provided with the arms *l*, the rod M, and the spring O, substantially as and for the purpose set forth.

137,409.—*Tumbling-Barrel for Cleaning Castings.*—FREDERICK N. BIXBY, West Meriden, Conn. Application filed February 17, 1873.

The barrel is of a polygonal form. The plates that form the sides are provided with corrugated lips that underlap each plate, and form openings for the dust to escape.

Claim.—1. The plate *b* of the tumbling-barrel provided with a rounded lip, *c*, substantially as and for the purpose herein described.

2. The tumbling-barrel composed of plates *b*, which have lips *c*, and are made with channels or grooves, substantially as described.

137,410.—*Saw-Set.*—ALFRED BOYNTON and WILLIAM BOYNTON, Brooklyn, E. D., N. Y., assignors to themselves and EBEN M. BOYNTON, same place. Application filed December 10, 1872.

The saw-teeth are bent between a lower stationary die-bed, having a series of alternate projections and depressions formed at an angle, and an upper die furnished with similar projections and depressions, swung in adjustable bearings and operated by a lever.

Claim.—The die *f* in the stock A, and swinging in adjustable bearings, in combination with the die *e*, the surfaces of which dies are adapted to setting saw-teeth, so that the die *f* will act with a drawing movement as it bends the teeth, substantially as set forth.

137,411.—*Brush-Machine.*—EDWARD F. BRADLEY, New Haven, Conn., assignor to JOSEPH SHELDON, same place. Application filed March 1, 1873.

The brush-back is placed on a table that has both a longitudinal and a transverse movement, caused by connection with a cam having two grooved faces, one regulating the transverse and the other the longitudinal movement. The periphery of the cam-wheel is toothed, each of the notches corresponding to a tuft-hole in the brush-back. Into these notches drops a pawl that is operated by a crank on the driving-shaft, so that each revolution of the shaft moves the cam one tooth, and thereby adjusts the table. When the boring or setting of the tuft is completed the machine is automatically stopped by arranging, in connection with the cam-wheel, a smaller toothed wheel having a projection on one side, said projection, when the work is completed, coming in contact with a lever which is connected with a bar which disengages the operating-pulley from the driving-shaft.

Claim.—1. In combination with the two tables G G', the two cams or grooves L^2 and P, in connection, respectively, with the said tables, so that each cam will impart an independent movement to one of the tables, and the movement of the tables in right angles to each other, the combined movement by the said two cams indicating the path or line of tufts to be set, substantially as set forth.

2. The toothed periphery of the cam, combined with the pawl *a* and stop *d*, and, in connection with the table G, supporting the block, and operating to impart to the said table an intermittent movement, substantially as and for the purpose described.

3. In combination with the clutch D and pawl *a*, and stop *d*, and the cams L^2 and P, the sliding bar E, lever T, and stud *t* on the wheel S, to automatically arrest the movement of the cams and tables, substantially as set forth.

137,412.—*Chimney.*—JEREMIAH BROWELL, San Francisco, Cal. Application filed February 3, 1873.

The several sections of the chimney fit one on the other, and are held in place by tie-rods which pass through the collars, one of which is placed at each joint. The rods are securely fastened at top and bottom.

Claim.—In combination with a chimney or stack made of sections C C, the bands or rings *d d*, constructed as described, and the upright binding-rods *r r*, combined and applied as and for the purpose specified.

137,413.—*Fan.*—GUSTAV BRUECK, New York, N. Y. Application filed February 12, 1873.

The fan, in its case, resembles a sheathed dagger, and upon withdrawal unfolds automatically.

Claim.—1. The combination of a scabbard, T, with the detachable fan A, which unfolds automatically on being withdrawn from said scabbard, substantially as described.

2. A fan composed of two folding sections, B C, which are connected at their inner ends to a central rod, D, and at their outer ends to leaves F F hinged to the handle, and subjected to the action of a spring, substantially in the manner and for the purpose set forth.

137,414.—*Wood-Screw.*—STEPHEN P. BURDICK, New York, N. Y. Application filed February 26, 1873.

The screw-thread is of such form that the screw can be driven into a piece of wood without tearing the fiber, and can only be withdrawn by turning it backward. The point is of harpoon shape, and enters the wood, splitting it.

Claim.—1. A screw having ovolo screw-threads, as herein shown and described, for the purpose specified.

2. A screw having a harpoon-point, *d e e*, as shown, and ovolo screw-threads, as set forth.

3. A screw having the depressed or sunken neck *f* and harpoon-point *d e e*, substantially as herein shown and described.

137,415.—*Anti-Frictional Bushing.*—FREDERICK S. BURR, Brooklyn, N. Y. Application filed February 7, 1873.

Improvement in anti-frictional bushings, consisting in so arranging the rollers, grooved to correspond with slotted or recessed retaining-strap, as to prevent the possibility of contact one with another, and also the combination of grooved rollers with said retaining-strap, as above described.

Claim.—The combination of the grooved rollers C C with the slotted or recessed retaining-strap A, substantially as and for the purpose hereinbefore set forth.

137,416.—*Dry-Goods Rack.*—CHARLES N. CADWALLADER, Philadelphia, Pa., assignor to LIZZIE D. CADWALLADER and THOS. KELLEY, same place. Application filed February 11, 1873.

The stand consists of four posts secured together by projecting cross-pieces, which form the supporting-arms. The cross-pieces on one side are placed midway between those on the adjacent sides. The stand is supported on a box-like base by passing the four posts through openings in the top of the box, and then through openings in a shelf arranged within the box. The posts are provided with shoulders, that rest on said shelf.

Claim.—The combination, with the box-like base B, of a rack, A, having two series of arms, *a a*, arranged at right angles to each other, and adapted to receive goods to be displayed, as set forth.

137,417.—*Guide for Silk-Winders.*—JAMES H. CAMPBELL, Willimantic, Conn. Application filed September 25, 1872.

In order to avoid friction the rotating guide is supported between the two adjacent ends of oppositely-disposed arms.

Claim.—1. The herein-described device for guiding silk or other thread to a bobbin, consisting of a grooved pulley or sheave mounted upon the two adjacent ends of the arms D D attached to the bed-plate B.

2. The combination of the sheave E and the supporting-arms D D with the guides F F.

3. The combination of the sheave E and the supporting-arms D D with the traverse-beam A.

137,418.—*Millstone Bush and Spindle.*—RODNEY S. CATHCART, Cincinnati, Ohio, assignor of one-half his right to THE STRAUB MILL COMPANY, same place. Application filed March 15, 1873.

Securing the bushing to the spindle and millstone by the devices described in the claim.

Claim.—1. In combination with the tapered spindle A, the bushing B provided with a corresponding central opening, and secured in relative circumferential position by means of the key C, substantially as and for the purpose specified.

2. The means employed for adjusting the bushing to and securing it in a central position within the stone E, consisting of the wedges G driven into the space F between said bushing and stone, and the lead H caused to fill the remainder of said space, substantially as shown.

137,419.—*Wagon-Seat.*—EDWARD C. COLE, Pawling, N. Y. Application filed March 15, 1873.

The seat is held securely by means of a stationary hook, which is kept in place by a spiral spring.

Claim.—The combination of the stationary hook *a* and spring-holder E, applied both to the seat of a wagon or other vehicle, with the slotted plate C arranged on the body of the vehicle, substantially as and for the purpose herein set forth.

137,420.—*Stump-Extractor.*—EDNEY COLYAR, Clayton, Iowa. Application filed January 15, 1873.

A screw-rod is elevated by a rotary sweep or lever, and the rod is caused to operate uniformly with the sweep, regardless of the irregularities of the ground or line of resistance of the stump or stone, so as to prevent lateral strain on the screw.

Claim.—1. The combination, with the screw-rod, of the two loose bearing-rings H, flat on their outer faces and convex on their inner faces, and with enlarged openings, when arranged on the rod in reverse order, so that the outer faces, respectively, rest flat against the sweep and top of the frame, and the convex faces are in contact, and rise or ride on each other, substantially in the manner and for the purpose described.

2. The combination, with the bearing-rings H and with the sweep E, of the plate G, arranged with the screw-nut F on the lower side of the sweep, and forming an enlarged bearing and surface for the upper ring, substantially as and for the purpose set forth.

3. The construction of the frame A, the same consisting of the uprights B B, connected in pairs and bearing against each other, with rods *b c* passing through the portions of the uprights which meet, and the flaring opening *c* at the junction of said uprights, in combination with the plate C secured to and bracing the top of the frame and engaging with the screw-rod D, substantially as and for the purpose set forth.

137,421.—*Dummy-Engine.*—JOSHUA COMLY, Philadelphia, Pa. Application filed December 7, 1872.

A belt connects the pulley upon the crank-shaft with pulleys attached to each of the driving-axles, and is tightened by means of a belt-tightener between the wheels, which is so arranged in combination with a brake device that, when the brake is applied, the tightener is released.

Claim.—1. The combination in a locomotive of a driving-pulley, A, two pulleys, B B, on the two driving axles, and intermediate tightening-pulley A, and a band passing round all the pulleys, as specified.

2. The combination, with the pulley A and wheels B B, of the brake-shoe *m*, arranged and operating as set forth.

137,422.—*Electrical Indicator for Elevators.*—JAMES H. COREY, New York, N. Y. Application filed November 14, 1872.

The lifting-ropes of the platform, as well as the guide-ways of the elevator, are made to contain the electrical conductors and connections by which an indicator or annunciator of position may be operated within the elevator.

Claim.—The employment of the guide-posts and working ropes of the elevator, or either, as conductors for operating, by electrical impulse from each or any of the several floors, an indicator carried by the cab or traveling platform, substantially as specified.

137,423.—*Painter's Pot.*—THOMAS E. COSTELLO, Brooklyn, N. Y. Application filed March 10, 1873.

Claim.—As a new article of manufacture, a painter's pot having a sharp edge at the mouth and made tapering from it to the bottom, and constructed wholly without solder, substantially as and for the purpose herein set forth.

137,424.—*Device for Filing Saws.*—AZEL P. DURANT, Athens, Ohio. Application filed January 24, 1873.

The saw-blade is securely clamped between the jaws of a table and the teeth brought to a proper edge. The file-handle is grasped between the last fingers and thumb, and the index-finger is placed upon the projecting lip of the carriage. The point end of the file is held between the fingers and thumb of the other hand, and can be freely manipulated by the operator.

Claim.—1. The combination of the file with a rolling carriage that aids to support and control it in its movements, when constructed to operate substantially as and for the purpose specified.

2. The combination of the file and rolling carriage, as above described, provided with a sliding head-piece, substantially as set forth, for the purpose specified.

137,425.—*Sealing Dip-Pipes in Gas-Works.*—HENRY H. EGGERTON, Fort Wayne, Ind. Application filed March 24, 1873.

A reservoir is connected with the hydraulic main, into which the water which makes the seal is drawn by exhausting the air from the reservoir so as to seal or unseal the dip-pipes at pleasure.

Claim.—1. The method herein described of unsealing the dip-pipes of a hydraulic main by the formation of a vacuum in a chamber or reservoir communicating with said main, or the section thereof containing the dip-pipes to be unsealed, substantially as and for the purposes shown and set forth.

2. The combination with a hydraulic main of reservoirs, one for each section of the main, each reservoir being connected with its section and with a vacuum or exhaust pipe for removing at proper times the air, in whole or part, from said reservoir, substantially as and for the purposes herein shown and set forth.

3. The combination with the reservoir connected with the hydraulic main and with an air-exhaust so as to operate to unseal the dip-pipes substantially in the manner set forth, of the outlet and tar pipes for removing the excess of tar as soon as formed from the reservoir, substantially as described.

4. In combination with the reservoir communicating with the hydraulic as described, a system of pipes or conduits communicating with the external atmosphere and with an air-exhaust substantially as specified, and provided with a suitable regulating cock or cocks, whereby the reservoir may be put in communication either with the external atmosphere or with the exhaust, to effect the sealing or unsealing of the dip-pipes, as described.

5. In combination with the reservoir communicating with the hydraulic main, as specified, the pressure-pipe for conveying compressed air to the reservoir to counteract accidental disturbances or increase of gas-pressure in the hydraulic, substantially as set forth.

137,426.—*Nut-Lock.*—JOHANN R. EICHENBERGER and CHRISTIAN G. BIRELY, Burton City, Ohio. Application filed January 25, 1873.

Claim.—The nut-lock consisting of a washer having the hinge-barrels *a a* and a stout rectangular loop arranged to embrace the nut on two sides and the bottom, and turned at its ends to form the hinge-journals *c c*, substantially as specified.

137,427.—*Spike-Making Machine.*—DAVID EYNON, St. Louis, Mo. Application filed November 8, 1872.

The guides are on toothed quadrants, which are pivoted at one end to the frame, and can be inclined by means of pinions.

Two arms extend from the heading-bar to the guides, and have grooved blocks pivoted to their extremities, which slide on the guides, and so placed in respect to the heading-bar that when the bar strikes the spike the centers of the quadrant and the centers of the sliding blocks coincide; the bar will then return to the same point at each successive stroke, no matter what may be the inclination of the guides.

Claim.—1. The combination of the heading-bar H and slides K with the adjustable quadrants M and their guides *g*.

2. The said slides and quadrants so regulated in respect to the movement of the heading-bar that their axes shall coincide when the said bar has reached the limit of its forward movement.

137,428.—*Machine-Gun.*—WILLARD B. FARWELL, New York, N. Y. Application filed March 8, 1873.

A series of breech-loading barrels are arranged in a frame, swinging on trunnions and turn-table. Cartridges are fed to the gun from hoppers having inclined bottoms by a vibrating trough-shaped dropper, and are forced into the barrel, and secured against the force of the charge by reciprocating cylindrical breech-closers, which closers are locked in position by bars operated automatically. Hammers are cocked and caused to operate by means of cams or eccentrics.

Claim.—1. The combination of a series of droppers, N, with a series of gun-barrels receiving the cartridges in slots in the tops, and a series of hoppers having inclined and slotted bottoms, substantially as specified.

2. In a machine-gun, the combination of the reciprocating receivers P and breech-closers R, operated intermittently by positive force, substantially as and for the purpose described.

3. In a machine-gun, the combination of a series of locking-bars, T, with a series of breech-closers, R, and automatic mechanism for operating the same, substantially as and for the purpose described.

4. The combination of the cranks *d*, rod *e*, link *f*, crank *g*, pinion *h*, bar *i*, yoke *j*, and cam *k* with the crank-shaft and the droppers, substantially as specified.

5. The combination of the bar *m*, toothed steel bars *n*, segmental wheels *p*, and rock-shaft *q* with the breech-closers, substantially as specified.

6. The combination of the bar *w*, toothed sliding bars *x*, segmental wheels *y*, and the rock-shaft *z* with the receivers P, substantially as specified.

7. The charger A', with slides C' and D', combined and arranged substantially as specified.

137,429.—*Hopper and Casing for Grinding-Mills.*—JOHN M. FINCH, Cedar Falls, Iowa, assignor to J. M. FINCH and URIAL TOBEY. Application filed February 11, 1873.

The casing and hopper, having branched feeding tubes, are made removable, to readily expose the grinders when necessary for dressing or repair.

Claim.—The casing H, being removably fitted in the lower casing, and having removably fitted thereon the hopper I with the two tubes *h h*, and arranged with the grinders D D and C and hubs *b b*, all constructed as and for the purpose set forth.

137,430.—*Bolt for Flour and Middlings.*—BENJAMIN F. FOREMAN and JOHN P. SPECK, Upton, Pa. Application filed December 28, 1872.

A series of bolting-reels, each having an interior fan or blast and an annular sieve for separating the fine specks from the coarse middlings, the fine middlings or flour being separated from the coarse before affected by the blast, this separation being made as soon as the middlings enter the reels, by an arrangement of bolting-cloth upon the reel surrounding the fan-case.

Claim.—1. The annular sieves 7, constructed and applied within the reels, substantially as described, for the purposes set forth.

2. The combination with the sieve 7 of the double-acting conveyer Q^1 and conveyer Q^2, arranged substantially as set forth.

3. The combination or arrangement of reels 1, 2, and 3, interior inclosed fans *f*, and annular sieves 7, for the purpose set forth.

4. The combination of the reels 1 2 3, fans *f*, sieves 7 conveyers Q^1 Q^2 Q^3 Q^4 Q^5, and the successive spouts, all arranged to operate as set forth, for the purposes explained.

137,431.—*Velocipede.*—WILLIAM GAFFEY, Philadelphia, Pa. Application filed November 1, 1872.

An inclined shaft, supported by the inclined frame, is provided at either end with bevel-wheels, one gearing with a bevel-wheel which is secured to the rear axle, and the other with a bevel-wheel which is secured to an axle which revolves within a frame over the forward wheel. Upon the crank-shaft is secured a cog-wheel, wheel which gears with a cog-wheel upon this axle. Stirrups are combined with the yoke, that the velocipede may be guided by the feet.

Claim.—1. The inclined frame D, constructed substantially as described, with cross-pieces *d* and E, so as to serve as a connecting and supporting medium for the various parts of the velocipede.

2. The inclined shaft *h*, furnished at its opposite ends with bevel-wheels *n* and *p*, and serving as a transmitter of motion from the front to the rear end of the velocipede.

3. The combination, substantially as described, of the driving-crank shaft H, its cog-wheel A, the shaft *k* with its cog-wheel *l* and bevel-wheel *m*, the inclined shaft K with its bevel-wheels *n* and *p*, and the bevel *q* on the rear axle, all substantially as specified.

4. The yoke B and stirrups or foot-rests *a a*, consisting of wrought-iron bars, bent and connected as described.

137,432.—*Ratchet-Drill.*—BERNARD GALLAGHER, St. John, Canada. Application filed December 30, 1872.

The ratchets are formed on a sphere, and the handle is so connected with the sphere that it can be operated at different angles, below and above a horizontal line, to turn the drill to the right or left. The handle carries two pawls, one to be used when the drill is turned in one direction, and the other when turned in the opposite direction. A hub can be made to connect the handle with the stock when the handle is to be vibrated on a horizontal line.

Claim.—1. The combination of the symmetrically-grooved ball *a*, ring *g*, the two piston-pawls *n n'*, and the springs *o o'*, when all are combined, constructed, and arranged substantially as herein shown and described.

2. In combination with the ball *a*, hub *b*, and ring *g*, the guide C or its equivalent, for the purpose and in a manner as set forth.

137,433.—*Bee-Hive.*—EDSON GERRY, Garden City, Minn. Application filed January 7, 1873.

A veranda protects the main entrance. The alighting-board is hinged below the bee-entrance and over the moth-entrance, when lifted closing the bee-entrance, and when lowered sheltering the moth-entrance. The body of the hive is divided by screen-partitions into three separate compartments, each having its external entrance and alighting-board.

Claim.—1. The hinged lighting-board H, having the bee-entrances *e e* above, and forming the shelter and guide to the entrances *f f* leading to the moth-trap below, all as and for the purpose specified.

2. The casing A, end doors B B, screen-partitions G G, combined with entrances *e e* and *b b*, having no passage between the separate divisions of the hive, as and for the purpose specified.

137,434.—*Diamond-Pointed Drill for Dental Use.*—JAMES P. GILLESPIE, Louisville, Ky. Application filed July 3, 1872.

By using a diamond point in place of a steel cutting instrument the shank just below the head can be made of soft or spring temper. If the cutter is of steel the shank near it must unavoidably be of hard steel, while the diamond head is of soft untempered metal. This drill can therefore be used while the diamond head is turned slightly from the axis of the drill, and yet not be broken off.

Claim.—A dentist's drill, formed of a light tempered steel or equivalent shank, A, with a head, C, and a diamond point, B, substantially as and for the purposes herein set forth.

137,435.—*Machine for Cutting Grindstones.*—JAMES P. GILLESPIE, Louisville, Ky. Application filed November 21, 1872.

The sliding brace rests upon the surface of the stone or rock being cut, and centers and protects the bit of the inner drill or cutter.

Claim.—1. The combination, in a machine for cutting grindstones, of the exterior cylinder A provided with a series of diamond points, *b*, and the central shaft or pipe D with diamond points *b* on its end, all substantially as set forth.

2. In combination with a rotating cylinder, A or D, the longitudinally-adjustable and removable diamond-carrying teeth *a*, connected to the cylinder by a dovetail, substantially as herein set forth.

3. In combination with two tubular holders provided with diamond or carbon pointed steel teeth and one within the other, a circular sliding brace, E, surrounding the inner tube and fitting within the other, substantially as and for the purposes herein set forth.

137,436.—*Iron Tender and Car Frame.*—JOSEPH W. GOFF, Providence, R. I. Application filed February 12, 1873.

Claim.—A car or tender frame composed mainly of iron bars or beams which are rolled or formed in one main section, with two angular sections projecting therefrom in opposite directions at right angles thereto, and in different planes, substantially as and for the purpose specified.

137,437.—*Mainspring Safety Attachment for Watches.*—RICHARD GOVE, Laconia, N. H. Application filed April 1, 1872.

The outer end of the mainspring folded back upon itself has its extremity resting in a slight recess on the inside of the rim of the watch-barrel without any permanent attachment thereto, the object being to provide a sufficient hold of the spring upon the barrel in the direction of its normal strain, while allowing a slip in the reverse direction in case of a rupture of the spring.

Claim.—A detached watch-spring, made and bent back at its outer end, as described, its extreme tip being lodged in a slight notch in the inner face of the rim of the barrel and held by the mere force of the spring, and slipping from the notch in case of breakage of the spring, as and for the purpose described.

137,438.—*Spark-Arrester.*—WILLIAM F. GRASSLER, Muncy, Pa. Application filed January 2, 1873.

Having a hollow inverted cone with an adjustable deflector, whereby the sparks and cinders are thrown against a double-deflecting disintegrator, with an annular space between the inner and outside pipes for letting the sparks down into the smoke-box.

Claim.—1. The disintegrator G G', when constructed and arranged to operate substantially as and for the purpose specified.

2. The combination of the disintegrator, inverted bowl, and deflector with the enlarged portion of a spark-arrester, substantially as shown, and for the purpose specified.

3. The combination of the adjustable deflector F and the inverted bowl E with the interior pipe of a spark-arrester, substantially as and for the purpose set forth.

4. The combination of the inverted bowl E and the disintegrator G G', substantially as set forth.

5. The combination, in a spark-arrester, of an outer pipe, B B', an interior pipe, C, an inverted bowl, E, deflector F, and a disintegrator, G G', the parts being arranged to operate substantially as and for the purpose set forth.

137,439.—*Can for Transporting Nitro-Glycerine, &c.*—ALEXANDER HAMAR, Philadelphia, Pa. Application filed March 22, 1873.

A can possessing the usual filling and discharge tube, &c., said gas-tube being provided with one or more funnel-shaped diaphragms suitably perforated for the passage of gases.

Claim.—A can for the transportation of nitro-glycerine or similar explosive materials, provided with a discharge-nozzle, and with a vent-tube having one or more funnel-shaped diaphragms for the escape of gases created within the can, substantially as described, for the purpose specified.

137,440.—*Manufacture of Nitro-Glycerine.*—ALEXANDER HAMAR, Philadelphia, Pa. Application filed March 22, 1873.

The mixed acids from a tank flow along a trough, into which falls a small stream of glycerine. The compound stream falls upon a cold coil.

Claim.—1. The apparatus herein described for the manufacture of nitro-glycerine, consisting of a receiving-tank with a cooling-coil, upon which the mixture of acid and glycerine is caused to fall for mixing and cooling the same, as set forth.

2. The mode herein described of automatically manufacturing nitro-glycerine by flowing the acid and glycerine through a trough upon a cooling-coil, substantially as described.

3. The use of chloride of sodium, or its equivalent, in the manufacture of nitro-glycerine.

137,441.—*Crank-Shaft Eccentric.*—JOHN F. HASKINS, Fitchburg, Mass. Application filed January 3, 1873.

The crank-shaft eccentric, integral with the shaft, and combined with the removable and concentric supplemental ring, for frictional wear upon an eccentric.

Claim.—The crank-shaft eccentric, integral with the shaft and combined with the removable and concentric supplemental ring *d*, substantially as shown and described.

137,442.—*Projectile.*—SAMUEL HATT HAYCOCK, Ottawa, Canada. Application filed January 6, 1873.

Combination of elongated projectile provided with recess, and wooden plug having a conical rear end, whereby the projectile is forced to take the grooves when fired, and the tendency to a void behind the same is obviated.

Claim.—1. The projectile herein described, composed of an elongated body, A B, and a plug, F G, of lighter material, formed with a conical or tapering rear end.

2. The construction of the plug F G with a cylindrical forward end, H, fitting a corresponding cavity in the projectile A B, so as to hold the parts more securely together before use, and permit more free movement of the plug.

134,443.—*Spindle-Step.*—JOHN J. HENRY, Baltimore, Md. Application filed February 26, 1873.

Claim.—1. The screw-threaded guide or bearing B, constructed with the inverted conical opening and aperture through which the spindle-toe passes, and adapted for vertical adjustment around such toe, and within the recessed base A, to compensate for wear, substantially as described.

2. The locking-nut F, in combination with the adjustable guide or gearing B, substantially as described, for the purpose specified.

3. The step for spindles and other shafts, consisting of the guide or bearing B, adapted to screw into the base A, and the locking-nut F, arranged upon the guide above the base, substantially as described, for the purpose specified.

137,444.—*Packing for Piston-Rods.*—JOHN F. HERMANCE, New Haven, Conn., assignor to HENRY P. OSTROM and AARON C. ANDREWS, same place. Application filed September 20, 1872.

The India rubber, being compressed, forces the internal fabric onto the rod, and, externally, onto the box, so as to perfectly pack, and prevent the escape of steam.

Claim.—As an article of manufacture, the herein-described stuffing-box packing, consisting of the divided rings, formed from an India-rubber body, completely inclosed within a fabric, substantially as set forth.

137,445.—*Sad and Fluting Iron.*—JOHN HEWITT, Pittsburg, Pa. Application filed January 23, 1873.

A sad and fluting iron combined with both faces, finished as a sad-iron, and the fluting device inclosed within the body of it, which separates near its center, by which the fluting device is exposed and brought into use.

Claim.—The iron plate A, consisting of two section-plates, B and B', having grooves D D and rollers D' D', when the same are so combined and arranged as to operate substantially as described.

137,446.—*Dash-Rail for Children's Carriages.*—MERRITT HINE, New Haven, Conn., assignor to C. COWLES & Co., same place. Application filed March 7, 1873.

The center post is formed by doubling the wire at the center, instead of welding a separate piece at the center.

Claim.—As an article of manufacture, a dash-rail for child's carriage, having the center post formed in one and the same piece with the rail, by doubling at the center, substantially as set forth.

137,447.—*Sewer-Inlet Trap.*—JOHN HITCHCOCK, Springfield, Mass. Application filed March 12, 1873.

Claim.—The sink B, spout C, and valve D, constructed and arranged together in the manner and for the purpose set forth.

137,448.—*Roller Stand and Heater.*—CHARLES F. HITCHINGS, New York, N. Y. Application filed February 17, 1873.

The top of the heater having the smoke-nozzle, and supporting the water-reservoir, can be turned on the heater so as to bring the nozzle to any angle with the stove-door; thus the apparatus can be set in any place in the room. The water-jacket extends over the combustion-chamber nearly to the stove-door, and retards and diverts the flow of products of combustion. The water-jacket is connected by pipes with the reservoir above.

Claim.—1. The heater A, constructed with hollow walls, and with a hollow fire-space top, F, and with the openings *e* and *g*, substantially in manner set forth.

2. The heater-top F, cast in one piece with the flue-nozzle *a*, as specified.

3. The perforated flange *b* formed on the heater-top F, which carries the flue-nozzle *a*, to permit the turning of said top, as set forth.

4. The combination of the water-heater A A, containing the chambers *d f*, with the circular top F, carrying the flue-nozzle *a*, and with the boiler G and pipes H and I, all arranged to operate as specified.

137,449.—*Middlings Receiver, Cooler, and Duster.*—ANDREW HUNTER and CHARLES E. WHITMORE, Quincy, Ill. Application filed March 17, 1873.

Middlings from bolting-reel pass into a receiver, cooler, or duster by a conveyer, where they are spread out into an attenuated sheet, or into small bodies or streams, subjected to a current of air for removing the specks and light particles of bran, and in a measure the moisture; and also for cooling the middlings before they are subjected to rescreening.

Claim.—1. The tube A, in combination with a discharging-conveyer, and the fan, or its equivalent, for producing a current of air through the tube, substantially as and for the purpose set forth.

2. The spreader L, provided with radiating slats *s*, substantially as and for the purpose described.

3. The hand-brush K, provided with rods *k* and handles *k'*, in combination with a conveyer, bolt, or screen, substantially as and for the purpose described.

4. The combination, with the tube A, of the conveyer B, brush or brushes K, and fan H, all arranged and operating as and for the purpose set forth.

137,450.—*Curtain-Fixture.*—ALBERT D. JUDD and EDWARD M. JUDD, New Haven, Conn., assignors to HUBERT L. JUDD, Brooklyn, N. Y. Application filed February 24, 1873.

The rack slides through a loop or strap, which is permanently attached to the window-casing. Under the loop or strap a lever is arranged having a tooth on one end to engage the rack-teeth. The pulley is secured upon a boss or hub projecting from the upper end of the rack-bar, and the pulley revolves partly on the boss and partly on the rivet that holds it to the rack-bar.

Claim.—1. The dog *c*, made with the lever end 4, tooth 5, and lip 6, in combination with the loop *c* and rack *a*, substantially as set forth.

2. The boss 2 upon the rack-bar *a*, around which the pulley *b* revolves and into which boss the rivet or screw *c* passes, as set forth.

137,451.—*Water-Proof Material.*—XAVIER KARCHESKI, Belleville, N. J., assignor to SOLOMON D. MCMILLAN, trustee, New York, N. Y. Application filed March 15, 1873.

Claim.—As a new article of manufacture, cloth or other vegetable textile fabrics, either alone or united with paper or similar fibrous material, rendered insoluble in water by treatment with sulphuric acid, substantially as and for the purpose described.

137,452.—*Process of Rendering Fibrous and Textile Materials Water-Proof.*—XAVIER KARCHESKI, Belleville, N. J., assignor to SOLOMON D. MCMILLAN, trustee, New York, N. Y. Application filed March 15, 1873.

Claim.—1. The acid-bath of a temperature under 50° Fahrenheit, substantially as and for the purpose set forth.

2. Removing the material operated upon from the acid-bath and subjecting it to a higher temperature, either by exposing it to moist air or to heated air, substantially as and for the purpose described.

3. Prolonging the water-bath, substantially as and for the purpose described.

4. Subjecting the material to pressure under water, for the purpose described.

5. The process as a whole, consisting of the three steps distinctively referred to, substantially as described, and for the purpose set forth.

137,453.—*Nut-Lock.*—GEORGE W. KERN, Zanesville, Ohio. Application filed February 27, 1873.

The washer has inclined projections on its face, over which the nut is allowed to pass by reason of the rounding surface on the bottom of the washer, which allows it to rock.

Claim.—The rocking nut-lock washer, made with projections *b* or *d* at its back, and with the inclined projection *a* on its face, substantially as specified.

137,454.—*Gas-Regulator.*—PETER KELLER, New York, N. Y., assignor to himself and JOHN HEIM, same place. Application filed January 21, 1873.

A metallic cap fits loosely over the nipple, which rises within the casing and governs the flow of gas through perforations near the upper part of the nipple. A guide-pin upon the top of the cap passes through a hole in the upper plate, and a spiral spring surrounding the guide-pin bears against the cap and upper plate.

Claim.—In a gas-regulator, the cap D, having the solid depending flange for loosely overlapping the series of perforations *c c* near the top of the nipple B, and provided with the guide-pin *d* and spring *f*, as described, in combination with each other and with the casting C and shell A, substantially as herein shown, for the purpose specified.

137,455.—*Car-Coupling.*—CHARLES H. KNOWLTON, Rockland, assignor of one-half his right to FULLER G. COOKE and JOHN D. SPEAR, same place, and JOSEPH E. ROBINSON, Augusta, Me. Application filed January 31, 1873.

Claim.—1. A sliding frame to hold the springs of the draw-bar, combined with such springs and with the draw-bar and platform in such a manner that the frame, springs, and draw-bar can all be moved forward and backward together at will without changing their relative position to each other, substantially as described, for the purposes specified.

2. The frame F, draw-bar D, and springs c c^1 c^2, combined substantially as and for the purposes set forth.

3. The frame F, draw-bar D, and bar A, having two stops, combined and operating substantially as and for the purposes set forth.

4. The spring S, in combination with the frame F, draw-bar D, and the two stops, substantially as and for the purposes described.

5. In combination with the sliding frame, the sliding draw-bar, and the stops, a lever, or its equivalent, so arranged that by means of it the operator, standing upon the car-platform, can disengage the stops from the sliding parts, and leave the latter free to move, substantially as and for the purposes described.

6. A sliding draw-bar, a stop for holding it projected beyond or retracted beneath the platform, and a device for throwing the stop into or out of connection with the sliding parts, in combination with a lever, or its equivalent, extending to the platform, so that the whole apparatus can be adjusted and locked by a person standing on the platform, substantially as and for the purposes described.

7. The lever L, in combination with the sliding frame F, the locking-bar A, the lever C, and the draw-bar D, substantially as and for the purposes described.

8. The sliding arms M M, capable of being operated by means of a lever, L, or its equivalent, by a person standing on the platform, substantially as and for the purposes set forth.

9. The sliding arms M M, in combination with a locking device constructed to lock the arms in position when either thrust out or drawn back, substantially as and for the purposes set forth.

10. The combination of the sliding arms M M with the sliding draw-bar D, when constructed and connected so that a movement of the draw-bar in one direction moves the arms in the opposite direction, substantially as described.

11. The sliding arms M M, in combination with the sliding draw-bar D and frame F, and with the lock A and lever L, substantially as described, for the purposes specified.

12. A sliding draw-bar, a locking device, and sliding arms M M, in combination with a lever to operate the locking device, and a lever to operate the draw-bar or arms, or both, said levers being both arranged to be operated from the platform of the car, substantially as and for the purposes set forth.

13. The sliding draw-head D and the hook *h*, in combination with the shoulder *t* on the platform, substantially as and for the purposes set forth.

137,456.—*Burglar-Proof Door, Safe, &c.*—GEORGE LITTLE, Rutherford Park, N. J. Application filed October 25, 1872.

The safe is provided with recesses for the reception of chemicals (such, for instance, as phosphate of calcium) and water. These are separated by a friable substance, which will break by the jar, strain, or concussion to which the door or safe is usually subjected by burglars, and allow the chemicals to commingle and produce a light, together with a pungent penetrating vapor or smoke, which will force the burglars to retire.

Claim.—The burglar-protection for doors, safes, &c., consisting of two substances that will combine to produce light, smoke, or vapors, and a separating medium of glass or other easily-broken material, substantially as and for the purposes set forth.

137,457.—*Adjustable Stove-Pipe Cover.*—THOMAS M. LOSEE, Elmira, N. Y., assignor to THE LOSEE MANUFACTURING COMPANY, same place. Application filed August 17, 1872.

A metallic face-plate composed of two concentric rings and a central adjustable register or ventilator, and a set of guards or heat wires, designed to secure the device to the chimney-hole and to hold the stove-pipe.

Claim.—The face-plate ring, having its inner edge flanged at *x*, in combination with the bent wire *b* and button *d*, substantially as specified.

137,458.—*Hinge.*—WASHINGTON I. LUDLOW, Washington, D. C. Application filed March 22, 1873.

Flanges are cast upon the ends of the hinge, so that by driving the hinge into the mortise these flanges will hold it in place until the screws are inserted. Combined with this device are semicircular ridges upon the outsides of the leaves, which ridges fit into circular holes bored into the door and jamb placed closely together.

Claim.—1. The leaves or wings A B, formed with beveled or flanged edges H, for the purpose of securing the leaves or wings in their respective mortises, thus temporarily hinging the parts until they can be secured by the fastening-screws, as herein specified.

2. In combination with the beveled or flanged edges H, as in above claim, the series of ribs or ridges E, constructed substantially as herein shown and described.

137,459.—*Sugar-Drier.*—ALEXANDER MACKEY, New York, N. Y. Application filed February 5, 1873.

The hinged hollow drying-platforms, arranged alternately on opposite sides of the drying-chamber, can be adjusted at any desired angle. The hollow pivots connect the steam-pipes with the chambers in the platforms.

Claim.—1. The chamber A provided with the pivoted heating-platforms D, which are alternately arranged on opposite sides and adjustable on their pivots, substantially as described.

2. The hollow platform D provided with a hollow pivot, *e*, which connects with the steam-pipe E, as specified.

3. The curved pipe *b* extending from the pivoted hollow platform D into or over the curved pipe *d*, to allow the platform to vibrate on its pivot without severing its connection with the pipe *d*, substantially as herein shown and described.

4. The drying-chamber A containing the hollow adjustable pivoted platforms D D, and provided with the steam supply and discharge pipes E, and with the air-pipes F and G, substantially as set forth.

137,460.—*Brick-Machine.*—SAMUEL MARTIN, Knobnoster, Mo. Application filed January 21, 1873.

Molds, on a traveling belt, receive the clay from the hopper, and then pass beneath a yielding pressure-roller and a "scraper" or smoother. The bricks are discharged on an off-carrying belt by a spur, *f*, acting on the movable bottoms of the mold-boxes.

Claim.—The combination and arrangement of the hopper B, with stirrers C, molds D E *e*, belt *a b d a'*, projection *f*, roller G, and knife H, all constructed and arranged as and for the purpose specified.

137,461.—*Fruit Jar.*—JOHN L. MASON, New Brunswick, N. J. Application filed March 6, 1873.

Upon the neck of the jar is formed a screw-thread, terminating at both ends with square shoulders in such a manner as to leave a full thread to start with both in turning the screw-cap on and off, and the danger of running over the thread is obviated.

Claim.—1. The square shoulders *a a* on the ends of the screw-threads B B, formed by the transverse groove *b* on the neck of the jar, in combination with the screw-cap C, substantially as described.

2. The flat cover D, in combination with the gasket *d*, arranged on the shoulder *c* below the top edge of the jar, the flat cover being depressed on the gasket by the cap C, substantially as described.

137,462.—*Fruit-Jar Cover.*—JOHN L. MASON, New York, N. Y. Application filed February 14, 1870.

Plastic glass is applied to the inside of the cover by means of a powerful pressure.

Claim.—The mode herein described of uniting glass or enamel with a sheet-metal cover, the same consisting in applying the former in a hot and plastic state to the latter, and pressing them together, substantially as described.

137,463.—*Railroad Rail.*—MALCOLM F. MCINTYRE, Girard, Pa. Application filed January 21, 1873.

Claim.—A railroad rail having a wrought-iron rod or series of twisted wires inserted therein or incorporated therewith, substantially as shown and described.

137,464.—*Elevator.*—PETER W. MELLEY, St. Louis, Mo. Application filed November 21, 1872.

The rock shaft is connected with the elevator check-rope, so that when the operator pulls the check-rope the engine can be stopped, reversed, or started. To said rock-shaft is a grooved pulley attached, which is connected with a weighted brake-lever by means of a cord. The brake-lever is automatically lifted in the ascending of the elevator and thrown into action in its descent.

Claim.—1. The combination and arrangement of check-rope G^3, links *g*, hubs g^1, and arm G^2, as and for the purpose set forth.

2. The combination and arrangement of check-rope G^3, shaft G^1, arm G^2, arm G, link A^2, reversing-lever H, stems h h^1, forked arm A^2, and valve U, as and for the purpose set forth.

3. The combination and arrangement of check-rope G^3, shaft G^1, arm G^2, grooved pulley K, cord *k*, weighted lever K^1, and brake-band *k'*, as and for the purpose set forth.

4. The drum J^2, mounted loosely on its shaft *j*, and provided with circular ratchet teeth j^2, in combination with spring-dogs j^1 and hubs J^3, substantially as and for the purpose set forth.

5. The combination and arrangement of check-rope G^3, shaft G^1, arm G^2, grooved pulley K, cord *k*, weighted lever K^1, brake-band *k'*, drum J^2, ratchet j^2, spring-dogs j^1, hubs J^3, and shaft *j*, as and for the purpose set forth.

6. The dogs L^2, pivoted in cross-bar L, in combination with the straps L^1, spring *l*, ratchet-bars L^2, and guide-posts L^4, as and for the purpose set forth.

137,465.—*Buffing-Machine.*—WILLIAM W. MESSER, Jr., Boston, Mass., assignor to WILLIAM W. MESSER, Northwood, N. H. Application filed January 14, 1873.

The cone or cylinder is made hollow and fixed upon the end of a driving shaft so that it overhangs its bearings. The cone is open at both ends, and spiral-shaped blades are arranged within to create a current of air from the outer end as the cone rotates for the purpose of projecting the dust from the machine.

Claim.—1. A buffing-machine, having a cone-shaped or frusto-conical buffer surfaced with a removable sand-paper cover, substantially as described.

2. The rotary buffer-cone formed as a projection beyond the bearings of its shaft, substantially as shown and described.

3. The hollow frusto-conical buffer and the spiral blades formed within it, substantially as shown and described.

4. In combination with the hollow cone surfaced with a removable sand-paper cover, the propeller-wheel *i*, arranged substantially as shown and described.

5. In combination with the hollow cone, the trumpet-mouth guard-ring *k*, substantially as shown and described.

6. The conical shell, formed of the flexible abrader and to fit the cone *d*, substantially as described.

7. In combination with the cone *d* and sand-paper cone *f*, the ring *g* for securing the paper to the cone, substantially as shown and described.

137,466.—*Type-Setting Machine.*—CHARLES T. MOORE, White Sulphur Springs, assignor of one-half his right to THOMAS L. FEAMSTER, Lewisburg, W. Va. Application filed May 2?, 1872.

Upon the depression of one of a series of keys a lever is caused to enter one of a series of concentric grooves at one end of a constantly-revolving cylinder, through a wide longitudinal groove extending across the series, thereby moving one of a series of bars resting in longitudinal grooves, which, in turn, by moving the line of type in this groove, ejects a type into a circumferential groove in such cylinder, from which the type is removed by a tooth on a constantly-revolving wheel and a projection on the bar, and forced, together with the rest of the type, through a guide into one of a series of grooves in a removable form, which latter is moved automatically upon the completion of a line by the type coming in contact with peculiar mechanism.

Claim.—1. In a type-setting machine, the combination of a revolving cylinder with longitudinal grooves to carry the type and a circumferential groove to receive the type, a mechanism to move the type from the longitudinal to the circumferential groove, and a mechanism to move the type out of the circumferential groove and from the cylinder, substantially as and for the purposes herein set forth.

2. In a type-setting machine, the combination of a revolving cylinder with type-carrying grooves and a type-receiving groove, substantially as described, a mechanism to move the type from the carrying to the receiving groove, operated by a stationary key-board, and a mechanism to move the type from the receiving-groove and from the cylinder, substantially as and for the purposes herein set forth.

3. In a type-setting machine, the combination of a revolving cylinder with longitudinal grooves to carry the type and a circumferential groove to receive the type, a mechanism to move the type from the longitudinal to the circumferential groove, a mechanism to move the type out of the circumferential groove and from the cylinder, and an automatically-moving form to receive the type, substantially as and for the purposes herein set forth.

4. The part A of the revolving cylinder provided with a series of longitudinal type-carrying grooves, *a a*, and a single circumferential groove, *b*, into which the type are moved from the longitudinal grooves, all substantially as herein set forth.

5. The part C of the revolving cylinder provided with a single longitudinal groove, *d*, and a series of circumferential grooves, *e e*, each having side grooves and notches, substantially as herein described, and for the purposes set forth.

6. The arrangement of the key G with lug *f*, and the bar H with lug A, having flanges *i i*, and used in combination with the grooves *d e* of the revolving cylinder and the spring *n*, substantially as and for the purposes herein set forth.

7. The combination of the feed-bar I having teeth *t t*, projection *k*, and spring *m*, the type-box E with longitudinal ribs or grooves *o* and perforations at the top, and the follower J with spring-pawls *p s*, all substantially as and for the purposes herein set forth.

8. The arm *s* upon the feed-bar I, in combination with the arm *w* on the revolving wheel or cylinder L, for carrying the type out of the groove *b*, substantially as herein set forth.

9. The guide K provided with ribs *s x* projecting into the groove *b* on the revolving cylinder, substantially as and for the purposes herein set forth.

10. The adjustable bed O, in combination with form N, moved forward on the guides P P by the spring *z*, substantially as and for the purposes herein set forth.

11. The combination, with the form N, of the rod *d'*, spring *e'*, lever *f'*, slide *m'*, pawl *n'*, and spring *t'*, constructed and arranged to operate substantially as and for the purposes herein set forth.

137,467.—*Heating-Stove.*—GEORGE R. MOORE, Philadelphia, Pa. Application filed February 21, 1873.

By means of the notched rod the grate is made adjustable vertically. The fire-pot, being enlarged at its lower end, permits the grate to be turned vertically within it. The latch *a* holds the grate in a horizontal position. The poker B facilitates the descent of fuel and clinkers. The latch *b* holds the poker in position.

Claim.—1. The grate-hangings C C, or their mechanical equivalents, projecting beyond the surface of the stove, so that the grate may be adjusted by them at any height.

2. The enlarged portion of the fire-pot A at the bottom or mouth into the ash-pit, substantially as and for the purpose herein set forth.

3. In combination with the grate, the latch *d* for holding the same from tipping, also the handle in connection therewith for operating the grate, substantially as and for the purpose herein set forth.

4. The side poker B, in combination with the cylinder, substantially as and for the purpose herein set forth.

5. The latch *b*, when used for holding the side poker B, substantially as and for the purpose herein set forth.

137,468.—*Mainspring Attachment for Watches.*—SIDNEY S. MORRILL, Fulton, N. Y. Application filed December 16, 1872.

The outer end of the mainspring carries a cross-pin, which projects through slots on either side of the watch-barrel. A spiral groove in a side plate or cap against the barrel receives one end of the cross pin, and, being set on the winding-arbor so as to revolve with it, causes the outer end of the mainspring to be drawn toward the center as the said spring is wound up.

Claim.—1. In combination with the barrel and mainspring of a watch or clock, the pin E, slotted arm or arms D, and scroll C, for equalizing the power of the spring, substantially as specified.

2. The brace or support *f* attached to the under side of the arm D, substantially as specified.

137,469.—*Insect-Destroyer.*—DAVID G. MOSHER, Mosherville, Mich. Application filed February 19, 1873.

An improvement upon a former patent, 119,389, dated September 26, 1871, consisting of an automatic box cover for retaining the insects when captured.

Claim.—1. The box A constructed with a flaring mouth having tines and wings on each side, in combination with the hinged clapper, as and for the purpose set forth.

2. The clapper G made adjustable upon the arms D', and used as and for the purpose set forth.

3. In combination with the bottom of the box, the stop *b*, as and for the purpose set forth.

4. The combination, with the box A, of the chamber B having a hinged lid upon its top which operates automatically when the box is being used for catching insects, as set forth.

137,470.—*Car-Coupling.*—HUGH MULHOLLEN, Fostoria, Pa. Application filed February 27, 1873.

Claim.—The jaws B B, in combination with the springs C C, coupling-bar E, hook D, and levers I I, the several parts being constructed and operating as and for the purpose set forth.

137,471.—*Metallic Case for Turbine Wheels.*—ABRAHAM MYERS, Salem, Oreg. Application filed March 19, 1873.

A portable metallic case for turbines running upon horizontal shafts, combining in their construction water-induction and eduction openings, a head-plate, and bridges with adjustable bearings, and a downwardly-bent draft-tube. The draft-tube is enlarged at the part which incloses the bridge at the angle where it admits the water from its horizontal to its vertical course, the effect of this tube being to bring into operation the entire pressure due to the head.

Claim.—1. A portable metallic case for a turbine running upon a horizontal shaft, combining in its construction water induction and eduction openings, a head-plate, and bridges with adjustable bearings, and a downwardly-bent draft-tube, substantially as set forth.

2. The downwardly-bent draft-tube, enlarged at the portion surrounding the internal bridge, substantially as set forth.

3. In combination with the horizontal shaft, the internally-placed bearings I I', having openings between the adjustable followers for the passage of the outflowing current of water, substantially as set forth.

4. In combination with bearings F F' and I I', fitted with adjustable followers, the adjustable step J, substantially as set forth.

137,472.—*Sanding Device for Locomotives.*—MILTON V. NOBLES, Elmira, N. Y. Application filed January 11, 1873.

The sand is dampened upon the wheels, causing it to adhere sufficiently to prevent it from falling off during revolution.

Claim.—The combination, with the wheel or wheels of a locomotive, of the sand-discharge and moistening-jet, substantially as and for the purpose specified.

137,473.—*Wash-Tub Holder.*—AMANDRIN M. OLDS, Greeley, Colorado Ter. Application filed December 30, 1872.

A tub-holder formed with three pieces of timber connected near their center, and constructed with notches on their upper ends to receive the tub, and the size and form of it held in position by an adjustable latch above the center connection.

Claim.—The leg-pieces C, provided with suitable bearings or notches D, whereby tubs may be securely held in position, when arranged in combination with the adjustable pieces E and center-block A, substantially as described.

137,474.—*Manufacture of Pigments Containing Zinc and Lead.*—FRANKLIN OSGOOD, New York, N. Y. Application filed March 21, 1873.

Claim.—1. The process herein described for producing zinc-lead, the same consisting in passing the vapors of zinc and lead produced by heating the above-mentioned compounds through a flue by means of a pressure of air-blast, as set forth.

2. The process of producing zinc-lead by the mixture of an ore and a metal, or the dross of a metal, in a furnace, substantially in the manner described, so that when vaporized by heat they will pass over through flues into chambers and condense into a material known as zinc-lead, having formed a complete union at some point of their passage.

3. The method described for the utilization of dross or skimmings of zinc known as "ammoniacal skimmings," for the purpose of combining the same with lead or ores, for the production of the pigment known as zinc-lead.

137,475.—*Manufacture of Carriage-Axle Boxes.*—WOLCOTT J. PALMERLEE, Fort Plain, N. Y., assignor to ADELLIA A. PALMERLEE, same place. Application filed February 28, 1873.

The blank, cut to the proper length and width, and stamped to form shoulders or steps on the outer end, is bent and welded over a mandrel placed in dies constructed to form a finished axle-box.

Claim.—1. The stepped blank B', of the form described, from which to produce an axle-box, as set forth

2. The die sections A A and mandrel a^3 c^3 c^2, combined, for producing from the blank B' an axle-box, substantially as described.

137,476.—*Hydrant.*—FREDERICK J. PAUL, Cincinnati, Ohio. Application filed January 14, 1873.

When the piston is moved up to close the hydrant it carries the valve with it until the latter seats itself. The discharge of water is then stopped, but the piston continues its upward motion until all the water in the discharge-pipe above the perforations in the same is discharged into the cylinder, the spring allowing the piston to move while the valve stands still. The valve is forced off its seat, to open the hydrant, by the descent of the piston.

Claim.—In combination with the cylinder D having a bellow neck, R, for a valve-seat, the pistoned pipe E F *f*, valve S P *e*, and spring T, connected and operating substantially as and for the purpose specified.

137,477.—*Refrigerator.*—CHARLES O. PECK, Pittsfield, Mass. Application filed September 14, 1872.

Improvement upon patent granted to Chas. O. Peck, dated June 11, 1872, No. 127,919.

Claim.—1. As a new article of manufacture, an ice-box for the interior of refrigerators, constructed of galvanized wire cloth, substantially as shown and described, and for the purpose specified.

2. In combination with the wooden lining of a refrigerator, the sheet-metal-covered floor extending for a short distance up the sides, for the purpose and in the manner shown and described.

137,478.—*Cultivator.*—HAZEN H. PERKINS, Osceola, Ill. Application filed October 1, 1872.

The drag-bars carrying cultivator-stems are raised or lowered by levers on the staples attached to the axle. The cultivator-teeth are attached to pivoted shoes, and may be set at any angle. The bar which supports the draft-clevis is vertically adjustable.

Claim.—1. The beams E E, carrying the shovels or plows, and adjustable by means of the slotted plates *b b*, provided with ratchets *d d*, and attached to the axle, in combination with retractile levers F F, arms *e f*, and brace-rods 10' 10', substantially as set forth.

2. The adjustable shoes 8', provided with screw-cranks or their equivalents, in combination with the shovels I, having a casting, 9', on the back provided with a cross-slot to receive the pin of the shoe, substantially as and for the purpose set forth.

3. The clevis *x x*, having a pivotal connection with cross-bar M attached to the beams E E by braces 2' 2', in combination with the adjustable bar *z* and cross-bar *y*, substantially as and for the purpose set forth.

137,479.—*Carriage-Axle Lubricator.*—HENRY F. PHILLIPS, Auburn, N. Y., assignor to SHELDON & CO., same place. Application filed March 13, 1873.

The peculiar packing will remain in the groove.

Claim.—A carriage-axle lubricator made by forming a groove or chamber on the upper side of the axle journal, which is filled with a packing composed of a fibrous material and of wire, and with oil or other lubricator, substantially as and for the purpose described.

137,480.—*Curtain-Fixture.*—PHINEAS W. PHILLIPS, Salem, Mass. Application filed March 6, 1873.

To the end of the curtain-roller is pivoted a shouldered pawl, and on the end of the roller, above the pawl, is arranged a stop to limit the movement of the pawl. On the curtain-bracket is arranged a stop for the pawl to strike against when it is desired to stop the unrolling of the curtain. The end of the spindle has a shoulder with which the shoulder of the pawl engages when the roller is taken out of the brackets, thereby preventing the unrolling of the curtain at such times.

Claim.—In a curtain-roller provided with a coiled spring to raise its curtain, the shouldered pawl *f* pivoted to the curtain-roller, as shown, in combination with the stop *l*, the projecting end *m* of the bracket F, and the shouldered end of the spindle E, all constructed and operating substantially as described, for the purpose set forth.

137,481.—*Fire-Extinguisher.*—WILLIAM K. PLATT, Camden, N. J., assignor to himself and ARTHUR M. GREENE, Philadelphia, Pa. Application filed January 17, 1873.

Two chambers, both contain a solution of soda, and communicate with each other. In one of them is the acid-receptacle, inclined so that on withdrawing the stopper and half-inverting the apparatus the acid must traverse both chambers before it is discharged through the hose.

Claim.—1. A fire-extinguisher in which two chambers communicating with each other, and both containing soda solutions, are combined with an acid-receptacle contained within one chamber, but common to both, substantially as set forth.

2. A fire-extinguisher having communicating chambers, and an acid-receptacle, and an exit-cock, all so arranged that the acid must traverse both chambers before reaching the cock, as set forth.

3. A fire-extinguisher in which the acid-receptacle is arranged in respect to the soda-chamber or chambers substantially as set forth, so that the contents of the same shall be discharged into the said chamber or chambers on half-inverting the apparatus, substantially as specified, and as illustrated in Fig. 3.

4. The acid-receptacle D, inclined in respect to the pressure-chamber, within which it is contained, for the purpose specified.

5. The acid-receptacle D, pivoted to a frame, *c*, above its center of gravity, and arranged to be fixed to the said frame by a set-screw, *f*, or otherwise, substantially as and for the purpose set forth.

137,482.—*Wooden Truss-Bridge.*—THOMAS WILLIS PRATT, Boston, Mass. Application filed January 16, 1873.

A continuous bond of the parts is formed the whole length of the bridge.

Claim.—1. A wooden truss-bridge, in which the braces are arranged in a series of triangles by grouping planks together in sets of two or more as the strain increases, and lapping each other at their intersection, and thoroughly secured to the upper and lower chords and to each other, substantially in the manner described.

2. The mode of stiffening the braces laterally by springing them outward or apart from each other at or near their center, and securing them in that position by the use of clamps, with studs between the braces secured by metal bolts, substantially in the manner described.

137,483.—*Fire-Escape.*—HENRY A. RICHARDS, Chicago, Ill. Application filed January 24, 1871.

The sleeve to which the ladder is attached traverses upon the shaft, but by means of a spline rotates with it so that the ladders can be wound up within the cornice when not in use.

Claim.—In combination with shaft A and the mechanism B C C' and D for rotating said shaft, the reciprocating sleeve A', arranged to rotate with said shaft, wheel J, rope *g*, and ladders F and F', as specified.

137,484.—*Process of Treating Fibrous Substances for Paper-Stock.*—THOMAS ROUTLEDGE, Ford Works, near Sunderland, England. Application filed February 28, 1873.

The fibers are submitted to an alkaline bath, and then to a fermentative steep. This stock is then bleached by hydrostatic percolation in a series of connected vessels, whereby the bleaching-liquor, having passed through the whole, is reintroduced into No. 1, and thus repeatedly used.

Claim.—1. The preliminary preparation of raw vegetable fibrous substances, in order to reduce them into a fibrous condition suitable for textile purposes, and for paper-stock, by steeping the same in an alkaline bath, and subsequently subjecting them to a fermentative steeping, substantially as hereinbefore described.

2. The continuous system of bleaching vegetable fibrous substances, by hydrostatic percolation in a series of vessels connected together, substantially as hereinbefore described.

137,485.—*Apparatus for Charging Gas-Retorts.*—THOMAS F. ROWLAND, Green Point, N. Y. Application filed February 11, 1873.

The coal is elevated into a hopper, whence it is led through chutes in a revolving drum into a series of turning buckets, which, on reclining the charging-machine, are successively discharged through the bottom, and thus maintain a supply for the charger at whatever point it may be for the time located. The buckets are opened and closed automatically, and a safe-guard is provided against returning a bucket unemptied.

Claim.—1. The series of buckets E supported on a railway, A', suspended in the retort-house, with connecting means carried on drums C C', combined and arranged to serve, relatively to the gas-retorts and the charging means M therefor, as herein specified.

2. In connection with the above, the construction of the buckets E with the upper portion curved to match to the peripheries of the drums, and with openings therein adapted to receive the loads from the interior of a drum, as herein specified.

3. The trap-door E' with its holding means E² F G mounted on the traversing-buckets E, in combination with the tripping device *m* carried on the charger M, all arranged for joint operation, as and for the purposes specified.

4. The safety opening device O, arranged, as shown, relatively to the traversing-buckets E, filling means C C³, and movable charging apparatus M, and tripping device *m*, as herein specified.

5. The construction of the drum C with a receiving-mouth, C³, at the center of the top, and with chutes C³ adapted to lead the coal from the said mouth to the several buckets, as herein specified.

6. The gates J K with suitable operating means, in combination with the revolving chutes C³ and series of traversing-buckets E, substantially as herein specified.

7. The elevator L L, hopper I, arranged, as represented, relatively to the revolving mouth C³, branched chutes C³, controlling means J K, and traversing-buckets E, substantially as and for the purposes herein specified.

137,486.—*Apparatus for Raking Gas-Retorts.*—THOMAS F. ROWLAND, Green Point, N. Y. Application filed January 30, 1873.

A rigid framing, supported on wheels running on ways on the foundation-frame, carries a jumping frame, which is raised and lowered by a sector connected thereto, and adapted to roll on the track which forms the tread of the supporting-wheels. To the jumping frame the rake-carriage, capable of a slight horizontal movement, is connected by transverse-dovetailed ways or guides. The forward movement of the main carriage gives a rising movement to the jumping frame which lifts the rakes as they advance; the backward motion lowers the jumping frame and its rakes. If anything prevents the heads of the rakes from settling into the coke the knuckle-joints yield, saving the rakes from breaking.

Claim.—1. In combination with a carriage, A, moving forward and backward on the support X, the rising and sinking frame B, rakes D *d*, and means for raising and lowering them so as to enter the retorts in an elevated and return in a depressed position, as herein specified.

2. The knuckle-joints C between the rake-levers D and the rising and sinking frame and its connections, as herein specified.

3. In combination with the traversing carriage A, rising and sinking frame B, and connected rakes D *d*, the transverse carriage B' and adjusting means O, arranged to allow the adjustment of the rakes to one side or the other within moderate limits, as herein specified.

4. The friction-sectors M and spring H, in combination with the traversing carriage A and its operating means, rising and sinking frame B, rakes D *d*, and a balancing or partially balancing means, F, arranged as shown, so that the changes of motion of the carriage A will elevate or depress the rakes, as herein specified.

5. The stops B² on the jumping frame B, arranged to serve relatively to the main frame A and to the means of raising and lowering B, as and for the purposes herein specified.

6. The water-connections D', in combination with the hollow levers D, rakes *d*, and means for operating them, as herein specified.

137,487.—*Gas-Retort Charger.*—THOMAS F. ROWLAND, Green Point, N. Y. Application filed January 20, 1873.

The revolving meter is provided with removable partitions, forming an increased number of chambers, and sets of removable blocks, by which the capacity of these chambers are still further decreased, so that the charges may be varied at will. The valves within the casing which alternately open and close the spouts are connected by links to a cam upon the end of the revolving meter.

Claim.—1. A revolving meter having two or more chambers, M' M², in combination with the hopper B, casing A, spouts E' E², and valves *e' e²*, as and for the purposes herein specified.

2. In combination with the revolving meter D, the removable partitions D' D² adapted to be introduced and removed by a longitudinal motion, as herein specified.

3. In combination with the meter D, hopper B, casing A, spouts E' E², and movable valves *e' e²*, the levers F' F², links G' G², and cams H' H², arranged for joint operation, as herein specified.

4. In combination with the hopper B, the revolving meter D, provided with the angular steel knives *d* mounted in the meter and adapted to facilitate the division of the pieces of coal which stand across the mouth, as and for the purposes specified.

5. In combination with the meter D and several spouts E' E² mounted at different levels in the casing A, the deflectors I J arranged as shown and adapted to retard the descent of the coal to the lower spout or spouts, substantially as and for the purposes herein specified.

137,488.—*Medical Compound for Kidney Diseases.*—WILLIAM A. RUTH, Wyoming, Del., assignor to JOHN T. JAKES, WILLIAM BROADAWAY, and W. A. RUTH, same place. Application filed September 28, 1872.

Thirty grains each of the ingredients mixed and steeped.

Claim.—The compound of sarsaparilla, marsh mallow, and gin, as specified.

137,489.—*Veneer-Cutter.*—JOHN N. SEIB, Boston, Mass. Application filed January 15, 1873.

Logs, either round, half-round, or rectangular, can be cut into veneers by a slight change in the stay-log and holding apparatus. The sheets are cut to uniform size.

Claim.—1. The combination of a rest, *w'*, with the stay-log G*, constructed and arranged substantially as and for the purpose described.

2. The combination of the adjustable brackets *d'* with the screw-rods *t* and the chucks *s*, substantially as and for the purpose specified.

3. The shaft *f'*, bearing on the surface of the circular log and connecting with a rock-shaft that actuates slides *n'* carrying a pad, *p'*, in combination with a cutting-edge, *q'*, substantially as and for the purpose shown and described.

137,490.—*Harvester.*—JOHN F. SEIBERLING, Akron, Ohio, assignor to CLIMAX MOWER AND REAPER COMPANY, Corry, Pa. Application filed April 5, 1872.

Claim.—The combination of a shaft, a sleeve movable endwise on the shaft and revolving therewith, two gear-wheels, one revolving on the sleeve, a clutch on the sleeve between the wheels, ratchets on the wheels, and a shipping-lever arranged to move the sleeve endwise on the shaft to engage and disengage the clutch with the wheels, for varying the speed of the cutters, substantially as described.

137,491.—*Explosive Shell.*—JOHN T. SENN, Troy, Ala., assignor of one-half his right to SIMON SCHWARZ, same place. Application filed January 11, 1873.

Combination of two hollow spheres, one within the other, and secured in relation to each other by a bolt and the fuse-stock.

Claim.—The shell, constructed as herein described, having the two separate and independent hollow spheres A B, one within the other, connected together by means of the bolt *c*, and provided with the shouldered fuse-plug *d*, extending from the outer into the inner shell, as shown and described.

137,492.—*Attachment for Wash-Boilers.*—THOMAS SHUMAN, Corning, Iowa. Application filed February 17, 1873.

An attachment for a wash-boiler, constructed in a plain conoidal form, with aperture near its lower edge and open top for the free circulation of steam, which, when condensed, passes through the openings to the bottom of the boiler.

Claim.—The device A A B B, of conoidal form, complete in one piece, with a series of perforations, 1 2 3 4, near its base, substantially as described, and for the purposes specified.

137,493.—*Smelting-Furnace.*—BYRON M. SMITH, Topeka, Kans., assignor to ELIZA S. SMITH, same place. Application filed January 23, 1873.

The heated air is passed through a water-chamber, where it absorbs moisture and passes thence to the base of the furnace, where it unites with steam and hydrocarbons, the steam having been previously superheated in a chamber placed in the base of the furnace, which also acts as a deflector for the combined gases.

Claim.—1. The elevated water-tank *c*, when arranged to feed the boiler, and the moist-air chamber, substantially as described.

2. The superheater-chamber *m*, in combination with steam-pipe *l* placed in the lower part of the furnace, for the purpose of acting as a deflector for the gases and to protect the jet-tubes from the metal, substantially as set forth and shown.

3. The concentric pipes or chambers *l p t* for conducting the air, steam, and gas into the furnace, when provided with suitable jet-tubes, substantially as shown and described.

4. The furnace *a*, boiler *b*, tank *c g*, and moist-air chamber *d*, when connected by the various pipes, in the manner and for the purpose set forth.

5. The moist-air chamber *d* for moistening the air before its entrance to the furnace, as specified.

137,494.—*Washing-Machine.*—EDWIN SMITH, Whitestown, N. Y. Application filed December 20, 1872.

A washing-machine with corrugated rolls, with journals passing through the sides or frame, and held in their position by springs. The frame or sides are made conical and beveled in their connection with the segmental strips, which connect it to the tub.

Claim.—The two rollers *c c'*, combined with frame A *d f*, the springs *b*, and conical beveled segments *a*, all arranged as described, and for the purpose set forth.

137,495.—*Process of Manufacturing Middlings-Flour.*—GEORGE T. SMITH, Minneapolis, Minn. Application filed October 12, 1872.

After first grinding and bolting, the middlings are subjected to a series of alternate purifications, grindings, and boltings, making a granular middlings-flour.

Claim.—The herein-described process of manufacturing flour from middlings by subjecting them to successive grindings, boltings, and intermediate purifications by currents of air, substantially as set forth.

137,496.—*Oil-Still.*—WILLIAM B. SNOW, Brooklyn, N. Y. Application filed September 21, 1872.

A reciprocating dasher is suspended within the still, a little distance above the bottom thereof, so as to preserve a thin film of carbonaceous matter upon the bottom of the still to prevent burning of oil. The dasher is operated by a direct-acting steam-cylinder located in the still.

Claim.—1. The reciprocating dasher D, corresponding in contour, as described, with the transverse section of the tank A, and arranged to move in a direction longitudinal with the latter, and at a slight but appreciable distance from the heating-surface of the tank, substantially as and for the purpose herein set forth.

2. The combination, with the reciprocating dasher D, arranged and operating as described, of the steam-cylinder E and its piston F, rod C', and connecting-rod G, acting direct upon the dasher, substantially as and for the purpose specified.

137,497.—*Steam-Boiler Feeder.*—ABEL SPENCER, Jr., Penn Yan, and THEODORE C. SPENCER, Elmira, assignors of one-third their right to E. M. BIRDSALL, Penn Yan, N. Y. Application filed December 3, 1872.

A revolving chambered cylinder placed vertically in a case connected by pipes to the feed-water, and the water and steam-spaces of the boiler, regularly feeds the water to the boiler, the steam admitted from the boiler being condensed by the feed-water. Glass gages connected with the water-chamber in the case indicate the height of the water.

Claim.—The combination of the case A, chambered cylinder B, chamber C, pipes D E F, and one or more indicators, G, all constructed and operated substantially as and for the purposes set forth.

137,498.—*Spring Bed-Bottom.*—WILLIAM D. SPENCER and EMERY PARKER, New Britain, Conn.; said SPENCER assignor to said PARKER. Application filed March 7, 1873.

Diagonal links are combined with transverse springs, the latter being arranged between the connected ends of the links, whereby the action of the spring is transverse to the line of strain.

Claim.—In a spring bed-bottom, the diagonal links *d d'* and *f f'*, combined with the transverse springs D, arranged between the connected ends of the said links, so that the action of the springs is transverse to the line of strain upon the bed-bottom, substantially as herein set forth.

137,499.—*Road-Scraper.*—JOHANN STEFFENSEN, Lyons, Iowa. Application filed November 4, 1872.

Claim.—The combination of a road-scraper, a harrow rigidly attached thereto, and a draft-chain connected to the harrow at or near its ends, substantially as set forth.

137,500.—*Reservoir Cooking-Stove.*—HENRY STEPHENS, St. Louis, Mo. Application filed January 24, 1873.

In this stove two features are combined—the water-reservoir forms the front wall of the fire-chamber, and the hot closet extends in part under the ash-pit.

Claim.—The within-described cooking-stove, consisting of the casing A B, oven C, fire-box D, ash-pit E, reservoir G with its back forming the fire-box front, the plate H, and the front oven J, all constructed substantially as shown, and for the purposes set forth.

137,501.—*Fruit-Knife.*—GEORGE W. STEVENS, San Francisco, Cal. Application filed September 20, 1872.

The knife is furnished with a semicircular curve midway of the blade, and from the middle of the outer side of the curve a short blade extends in a plane at right angles to the plane of the

main blade. Passing this knife through the apple removes two separate quarters and frees them from the core at one and the same time.

Claim.—A fruit-knife constructed with a portion of the blade curved, and having three or more straight blades radiating from the curved portion, as described.

137,502.—*Tray for Drying Fruit.*—GEORGE W. STEVENS, San Francisco, Cal. Application filed September 20, 1872.

Notches are cut transversely in the slats, which increase the air-space and more thoroughly expose the undried fruit.

Claim.—1. A tray for drying fruit, composed of wooden slats A, having transverse channels *b*, substantially as herein described.

2. The slats A, having the transverse or diagonal channels *b*, when united to form a drying-table, substantially as herein described.

137,503.—*Metallic Grinding-Mill.*—HENRY B. STEVENS, Buffalo, N. Y., assignor to GEORGE L. SQUIER, same place. Application filed February 5, 1873.

The peculiar construction of cone and concave; in connection therewith, the feeding-screw and spiral recess in cylindrical mouth; also devices for giving double adjustment to the concave, all clearly set forth by the claim.

Claim.—1. The combination, with the cone E provided with the square or polygonal end *e*, of the concave F, provided with notches *h* for insuring a regular and uniform feed, substantially as hereinbefore set forth.

2. The combination and arrangement, with the cone E and concave F, constructed as described, and having a cylindrical mouth, *i*, of the feeding-screw *m* secured in the end of the cone for grinding wet or parboiled corn, substantially as hereinbefore set forth.

3. The arrangement, with the cone E provided with feeding-screw *m*, and the concave F provided with the cylindrical mouth *i*, of the spiral recess or way *k* formed in the latter to assist in feeding wet or boiled grain, as hereinbefore set forth.

4. The combination, with the grinding-cone and concave and fastening-bolts *n*, fitted loosely in the flanges *o o*, of rubber blocks *p* arranged on the latter to facilitate the double adjustment of the concave, substantially as herein before set forth.

137,504.—*Machine for Operating Drills.*—JOHN W. STOCKWELL, Portland, Me. Application filed November 16, 1872.

The drill-rod is lifted to a certain or desired distance, when it is released and allowed to fall, receiving a rotary motion.

Claim.—1. The combination of the crank-shaft C, the link *e*, pin *d*, slotted clamp *e*, the blocks *f f*, when applied to the rod *a* and combined therewith in the manner and for the purposes herein set forth.

2. The combination of the adjustable cross-piece *l*, head *p* with the rod *a*, and a tamp, *m* or *n*, to operate as herein set forth.

3. The arrangement of the clamp *e* with its blocks *f f*, with the spring *y*, and toothed rack *y'*, as herein set forth.

137,505.—*Sofa-Bedstead.*—CHARLES STREIT, Cincinnati, Ohio. Application filed November 12, 1872.

The extension frame is drawn out on metallic slides, having stops to prevent the frame from being drawn out too far. The sinking frame, when used as a bed, is held up at the head by a supporting-prop that is hinged to the main frame.

Claim.—In combination with the parts A B C of an extension lounge, the interlocking slides F F' having stops *f' f''* and supporting-prop D, the latter being hinged to the part A, all substantially as specified.

137,506.—*Harvester.*—ENOCH TAYLOR, Memphis, Tenn. Application filed February 27, 1873.

A pair of vertical brush picker cylinders is arranged on each side of a wheeled vehicle, and parallel with and to the inner side of each cylinder is arranged a clearer or comb, which revolves in an opposite direction, and by which the picked cotton is taken from the picker-cylinder and deposited in a proper receptacle.

Claim.—1. The combination of brush-cylinders D E having bevel-pinions *d*, the shaft C having bevel-pinions *c c'*, and the wheels having pinions *d*, as and for the purpose described.

2. The pairs of brush-cylinders D E arranged on the vehicle on each side of frame F, one in the rear of the other, to operate as and for the purpose set forth.

3. A guide, H, suspended over side of vehicle and with respect to brush-cylinder D E, as and for the purpose specified.

137,507.—*Sand-Ejector.*—JOSEPH THAYER, Topeka, Kans., assignor, by mesne assignment, of one-fourth interest to ELIZA S. SMITH, same place. Application filed January 3, 1873.

On a water-pipe, having its lower end turned upward, are formed jet-tubes, arranged in a circle around a central tube, through which water is forced upward into the ascending pipe. Into this central tube extends a tube, through which a current of compressed air is forced, mingling with the water. The sand, being packed around the open part of the pipe containing the jet-tubes, is forced up the ascending pipe by the combined force of the air and water.

Claim.—1. The jet-tubes B arranged around the central tube C, substantially as specified.

2. The tubes B C D, when combined with the tubes G H, substantially as set forth.

137,508.—*Door-Plate and Indicator.*—THEABOLD M. TOBIN and WILLIAM F. TOBIN, Middlebury, Vt. Application filed March 10, 1873.

A cylinder carrying inscriptions is rotated within a cylindrical case to expose its lettering through a slot therein.

Claim.—1. The cylinder D, provided with suitable notices and name, as described, in combination with the spring *b* or its equivalent, and supported by its shaft in standards B on the plate A, for the purposes herein set forth.

2. The combination of the supports A B, shaft C, cylinder D, and case E with glass-covered opening *e*, all the parts being constructed and arranged substantially as and for the purposes herein set forth.

137,509.—*Vulcanized Rubber Compound.*—WILLIAM A. TORREY, Mont Clair, N. J. Application filed March 29, 1873.

Claim.—The improved rubber compound herein described, made by combining mica with rubber or other equivalent gum and vulcanizing, as set forth.

137,510.—*Harvester Rake.*—JOHN S. TRUXELL, Greensburg, Pa. Application filed March 10, 1873.

The cam for guiding the rake and holding it in position has two continuous tracks, and a pivoted switch directs the rake-arm upon one or the other, as desired.

Claim.—The cam G, constructed with the elevated part G^1, continuous edge G^2, and curved rib G^3, in combination with the pivoted switch L, all arranged and operating substantially as and for the purpose described.

137,511.—*Bed-Bottom.*—ANDREW TURNBULL, New Britain, Conn., assignor to THE NATIONAL WIRE-MATTRESS COMPANY, same place. Application filed November 22, 1872.

A cross bar, each end resting in a support, is attached to the side rails and made adjustable in the support by means of a screw.

Claim.—The cross-bar C of a bed-bottom frame, each end arranged in a support, B, attached to the side A, and made adjustable in said support by means of a screw, D, substantially in the manner set forth.

137,512.—*Apparatus for the Manufacture of Bromine.*—DEWITT C. TURNER, Clifton, W. Va. Application filed March 21, 1873.

Claim.—1. In a bromine-still, the angle-irons H and clamping-bars G, constructed and arranged substantially as described.

2. In apparatus for manufacturing bromine, the combination of the steam-pipe W, hose O, and worm F, substantially as and for the purpose mentioned.

137,513.—*Nut-Lock.*—EDWARD TURNER, Greensburg, Pa. Application filed January 31, 1873.

Claim.—A nut-lock, consisting of one or more disks, E, cut away at *e*, swiveled on a bolt, F, and applied to prevent a nut from turning on its screw, substantially as described.

137,514.—*Explosive Pile-Driver.*—HENRY VOGLER, Baltimore, Md. Application filed March 1, 1873.

The tube surrounding the plunger confines the gases, thus enabling the cartridge-chamber to be made shallower to prevent overheating.

Claim.—The shallow cartridge-chamber D, having annular platform *d* around its base, and the plunger E, having the surrounding tube *e*, applied together in connection with a pile-driver, as and for the purpose described.

137,515.—*Brush-Socket.*—PHILIPP WAGNER, New York, N. Y. Application filed March 13, 1873.

The socket for containing the bristles has a bridge or cap with two corrugations, into which the edges of the socket are forced and secured when pressed together.

Claim.—The bridge D, having strong subjacently-grooved ribs *d d* applied to the upper edges of socket A, as and for the purpose described.

137,516.—*Extension Table.*—SAMUEL E. WALES, Orford, assignor to himself and JAMES H. WILLIAMS, Warren, N. H. Application filed March 21, 1873.

The extensible part of the top is composed of a series of transverse rails connected together by webbing or other flexible material, the webbing being left loose or folded up between each rail so as to allow of the necessary extension. Between the webbing and the transverse rails a strip of elastic material is placed to aid in contracting the table-top. The frame-work of the table is composed of two pairs of bars, one sliding in the grooves of the larger pair. To the larger or outside bar is affixed a pivoted spring-catch that engages with notches in the inside bar and holds the table in an extended position.

Claim.—1. An extension table, the top of which is composed of two fixed end boards and an intermediate extensible series of flexibly-connected transverse rails, substantially as described.

2. The combination of the two-part frame-work end boards A^2 and B^2, rails D, elastic bands E, and flexible but inelastic bands *h'*, substantially as specified.

3. The bolt H *a*, spring *h'*, inclined plate I, in combination with bar A and bar B having notches *b*, substantially as described.

137,517.—*Machine for Forming Carriage-Clips.*—WILLIAM S. WARD, Plantsville, Conn., assignor to H. D. SMITH & Co., same place. Application filed February 12, 1873.

Two sliding bars, forced up by cams, bend the bar around the rounded block and against the sides of a former, and hold it in that position. The block is then drawn downward out of the way, and the plunger moves up and forces the bow of the blank up against the face of former, the surfaces that impinge against the blank being such as will suitably mold as well as bend it.

Claim.—In combination with the principal former F and auxiliary former *w*, the two jaws C and a follower, E, constructed and operated together, substantially as and for the purpose specified.

137,518.—*Machine for Piling Textile Fabrics.*—ALBIN WARTH, Stapleton, N. Y. Application filed March 21, 1873.

Cloth passing from the package-carrier, mounted so as to be easily reversed to provide for keeping the nap of two pieces laid face to face in the same direction, is laid under the holding devices as the carrier is reciprocated over the table. The slots in the holders allow the passage of a cutting-knife. In order to even the folds on the table the standards are made adjustable, and the cloth is passed from one to the other about rods or rollers fitted to the notches of the standards, and should the last end of the cloth not be of suitable length to reach from standard to standard then the standards are adjusted and the fabric moved over the rollers.

Claim.—1. The combination of a reversible receptacle, *a*, with a package-carrier, B, and a piling-table, A, substantially as shown and described.

2. The combination of a turn-table, D, (one or more,) with a piling-table, A, and package-carrier B, substantially as and for the purpose set forth.

3. The combination of the winding mechanism with the package-carrier B, substantially as shown and described.

4. The holders *e* provided with a shoulder or groove to form a guide in cutting the fabric, in combination with the gage-plates and with a piling-table, A, and package-carrier B, substantially as set forth.

5. The standards *k k* on the gage-plates C, in combination with rollers *l*, and with a piling-table and package-carrier, substantially as and for the purpose described.

137,519.—*Buckle Attachment to Harness-Saddles.*—JOHN B. WELFTON, Tabor, Iowa, assignor to J. B. WELFTON and J. M. BARBOUR, same place. Application filed February 27, 1873.

Two metallic plates are connected by screws and lugs so as to be adjustable. The outer plate is bent up in the form of a hook at its lower end to receive a buckle. The inner plate is secured to the pad-skirt.

Claim.—The metallic plates B and C, constructed substantially as described, and used in combination with the bed plate A, which is secured to the pad-skirt of a harness, as and for the purpose specified.

137,520.—*Harrow.*—HENRY WENDOVER, Norway, N. Y. Application filed February 15, 1873.

Harrows made of a series of bars, the ends of which are connected by plates pivoted together midway between the bars, so that they can be rolled or folded together.

Claim.—The folding harrow or drag, consisting of the bars A provided on their surface with the plates B, hinged at a point midway between the bars A, substantially as shown and described.

137,521.—*Manufacture of Gas for Illuminating, Heating, &c.*—RODNEY M. WHIPPLE, Chicago, Ill., and JAMES G. BLUNT, Leavenworth, Kans. Application filed March 29, 1872.

In an upright retort heated by a surrounding furnace is placed charcoal or other carbon, through which is passed superheated steam to form water-gas. In another upright retort, also surrounded by a furnace, is placed pumice-stone, through which is passed vapor of petroleum or other hydrocarbon, so as to form oil-gas. The gases from both upright retorts are mixed in a third retort.

Claim.—1. The process herein described for producing gas suitable for illumination, the same consisting in generating hydrogen by the decomposition of steam in a retort, and mixing with it a gas produced from petroleum or other oleaginous material produced from petroleum in a separate retort, substantially as shown, for the purpose set forth.

2. The combination of a hydrogen-retort and the oil-gas retort and the mixing-retort, substantially as shown, for the purposes set forth.

3. The hydrogen apparatus composed of an upright retort filled with charcoal or any other carbonaceous substance, a surrounding-furnace, and a steam-distributer, substantially as shown, and for the purpose set forth.

4. The method for mixing the hydrogen gas and the hydrocarbon gas by discharging them into the mixing-retort against each other, substantially as shown, and for the purposes set forth.

5. The compound gas herein described, made by combining the products resulting from the decomposition of steam by means of heated carbon with hydrocarbon gas, each being generated in separate retorts, and then combined, substantially in the manner described.

137,522.—*Carpet-Stretcher.*—DAVID WHITE, Normal, Ill. Application filed February 7, 1873.

A swiveled button and sustaining yoke are applied to the jointed strips composing the frame of the stretcher so as to look the stretcher in any desired position.

Claim.—The oblong swiveled button I and yoke J, combined with the stripe H F F, as and for the purpose set forth.

137,523.—*Apparatus for Making Ice.*—GARDNER WILLARD, New York, N. Y. Application filed March 20, 1873.

Any of the usual freezing-mixtures are placed in a revolving cistern, which is surrounded by boxes containing the water to be frozen, the whole inclosed in a box of non-conducting material. The chemicals used are recovered by distillation.

Claim.—1. The improved apparatus for forming ice, consisting of a wooden case divided into two compartments, the upper lined with a good non-conductor of heat for insulating the freezing-boxes, and the lower for holding the liquid solution, as set forth.

2. The method described for forming blocks of ice by means of movable boxes arranged in an insulated chamber at the sides and around a cistern containing a freezing-mixture, substantially as described.

3. The entire apparatus, consisting of the freezing-vessel *d* with boxes *c c c c* and vessel *f*, all arranged as described, for the purpose set forth.

REISSUE PATENTS.

5,342.—*Shuttle for Sewing-Machines.*—GEORGE A. EDWARDS and GEORGE SCHLEDER, Syracuse, N. Y. Patent No. 136,311, dated February 25, 1873. Application filed March 26, 1873.

The bobbin-supporting spindle is hinged to the shuttle-case, and the spring, the pressure of which is governed by the nut, presses the head of the bobbin into the annular depression, and thereby regulates the tension of the thread carried by the shuttle.

Claim.—The shuttle provided with the pivoted screw-threaded spindle, thumb-nut, and spring, and with the depression *c*, into which the head of the bobbin may be pressed by the spring and nut, as described.

5,343.—*Coating Wood with Rubber, Gutta-Percha, &c.*—K. W. HOLMES, Winona, Minn., and ANDREW ALBRIGHT, Newark, N. J.; said HOLMES assignor to said ALBRIGHT.—Patent No. 64,419, dated May 7, 1867. Application filed March 6, 1873.

Claim.—The process herein described of coating or lining wooden articles with vulcanized rubber, gutta-percha, or other known vulcanizable gum.

5,344.—*Duplex-Telegraph Apparatus.*—JOSEPH B. STEARNS, Boston, Mass., assignor to THE WESTERN UNION TELEGRAPH COMPANY.—Patent No. 126,847, dated May 14, 1872. Application filed February 10, 1873.

Condenser placed in a branch circuit connected to compensating circuit. When main circuit is broken, discharge from condenser neutralizes effect of static discharge from line.

Claim.—1. In an apparatus for double transmission, the mode herein described of neutralizing the effect of the return current from the line when the line is put to earth by means of a return current traversing the branch or compensating circuit during this time, substantially as and for the purpose shown and set forth.

2. In an apparatus for double transmission, the combination of a condenser with a branch or compensating circuit, whereby the effect of static induction upon the receiving relay or instrument is counteracted, substantially as and for the purpose herein specified.

5,345.—*Revolving and Tilting Chair.*—DANIEL E. TEAL, New Lisbon, N. Y., assignor to HEYWOOD BROTHERS & COMPANY. Patent No. 103,516, dated July 19, 1870; reissue No. 5,055, dated September 10, 1872. Application filed March 27, 1873.

A spider is secured to or upon the upper end of the supporting screw or swivel, and is connected by its arms with the lower side of the seat; the spider and seat are also connected together by springs. The nut supporting the swivel-screw is connected with a metallic spider having four arms, each provided with a socket to connect it with the respective legs of the stool.

Claim.—1. A swivel-chair, in combination with a tilting seat, when the interposing springs are secured to a metallic spider and to the chair-seat, as described.

2. The supporting-spider F, constructed as described with side spring-arms *f*, and connected to the screw E and seat G, substantially as and for the purpose shown.

3. A spider with a central nut, said spider provided with sockets for connecting together, and in combination with the legs of a chair or stool, substantially for the purpose described.

5,346.—*Middlings-Purifier.*—EDWARD P. WELCH, Georgetown, D. C., assignor to himself, JAMES H. WELCH, ROSIA W. WELCH, HERBERT P. WELCH, and JAMES A. MALONEY, same place.—Patent No. 135,953, dated February 18, 1873. Application filed March 17, 1873.

An auxiliary blast in jets from perforated tubes keeps brushes and under side of screen clean, and also may prevent tailings passing over too rapidly.

Claim.—1. The combination, in a middlings-purifier, of a screen or sieve, through which a blast passes in one direction while the middlings pass in the other, with auxiliary air-pipes with jets from an independent fan-blower, substantially as herein-before set forth, to blow off fine adhering farina, &c., from its under side, to keep the meshes clear and open, and prevent their clogging.

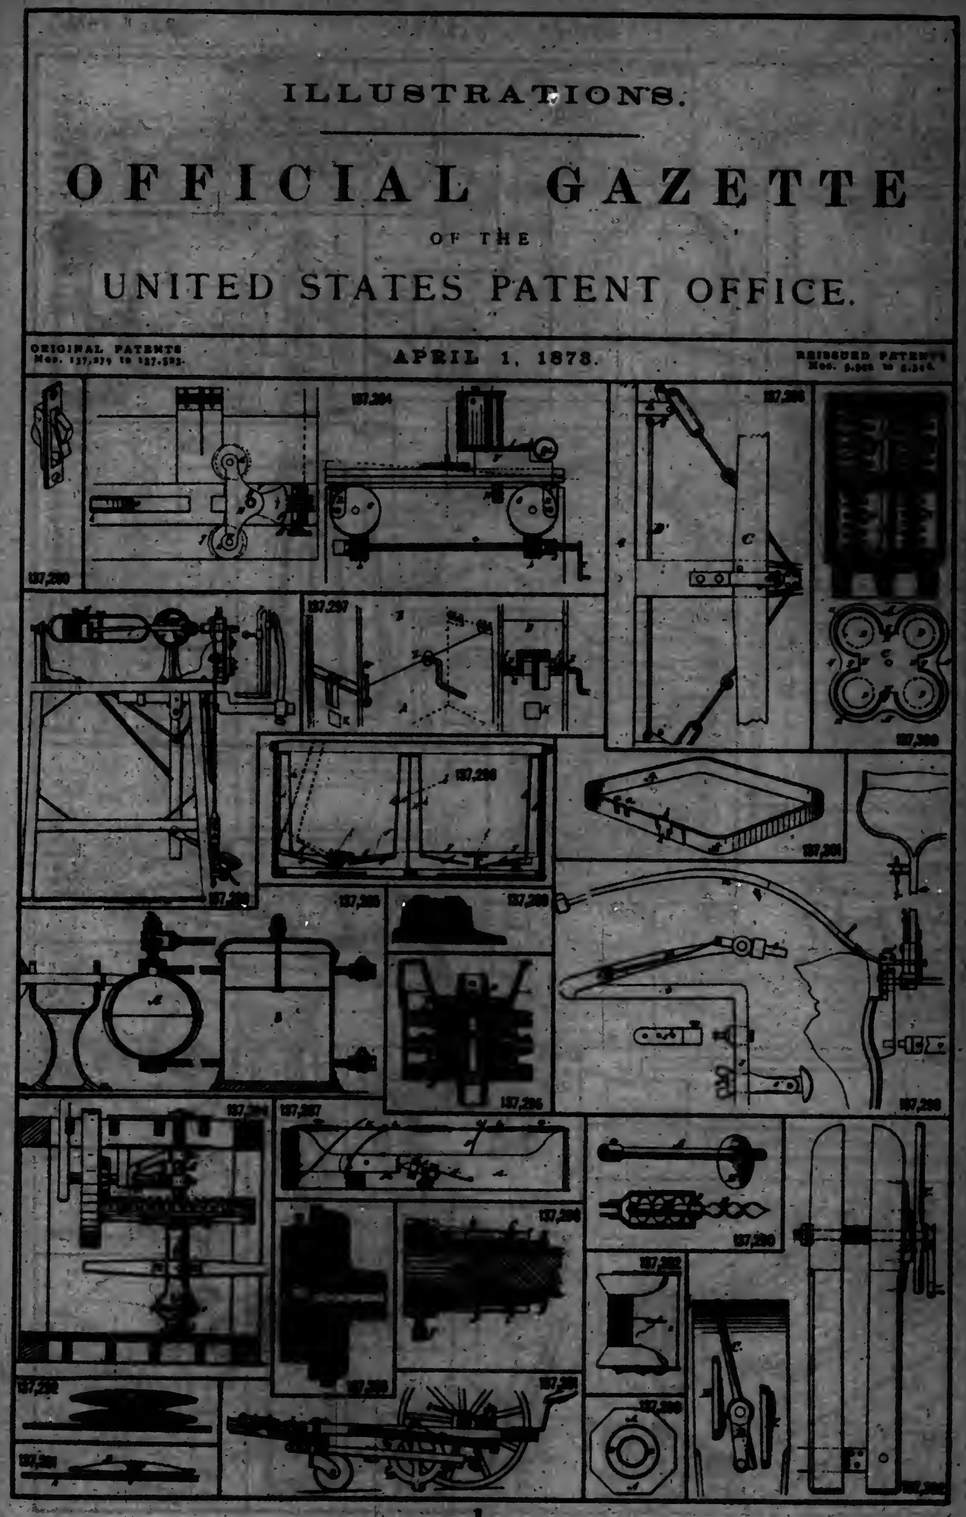
2. The combination, in a middlings-purifier, of a vibrating screen, through which a blast passes in one direction while the middlings pass in the other, with a brush rotating across the under side of the screen on an axis substantially perpendicular thereto, substantially as hereinbefore set forth, to produce a drawing action of the brush across the screen diagonal to its line of vibration.

3. The combination, in a middlings-purifier, of a vibrating screen, brushes rotating across the under side of the screen, and perforated air-pipes to direct streams of air upon the screen and brush, substantially as set forth.

INDEX OF INVENTIONS PATENTED APRIL 1, 1873.

[The numbers in parentheses denote the classification of patents.]

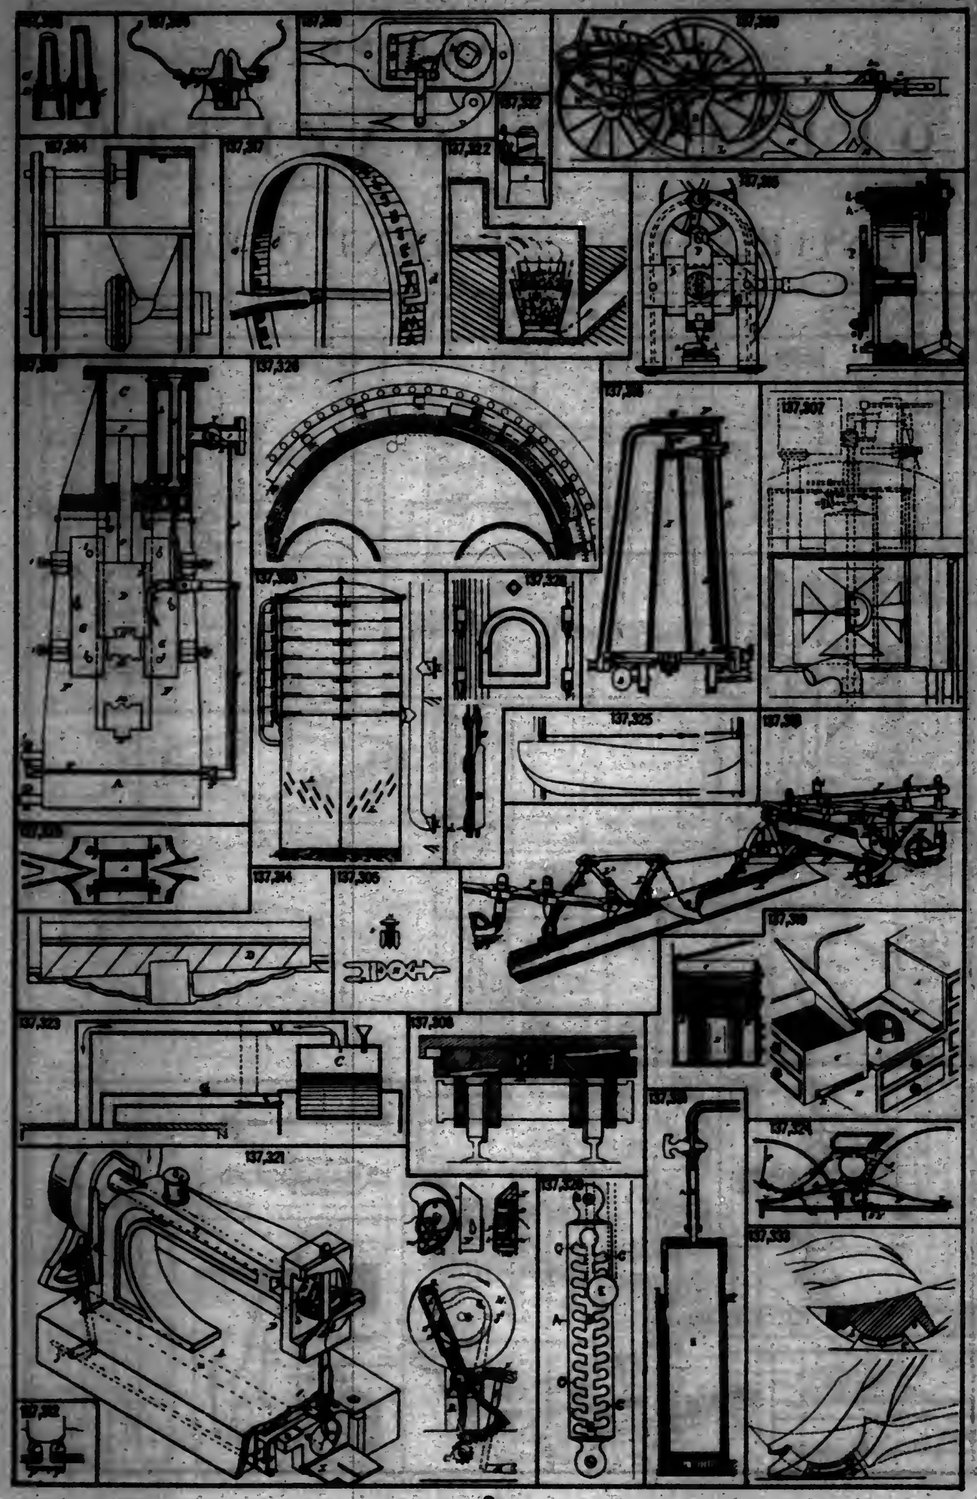
Alloy for producing ornamental coatings on metals, (113,) H. Aiken 137,279
Axle turning machine, (172,) A. F. Moore 137,316
Bag frames, manufacture of traveling, (102,) J. B. and C. F. Blakslee 137,339
Bale tie, cotton, (7,) A. J. Going 137,301



Barrel for cleaning castings, tumbling, (33,) F. N. Bixby.. 137,409
Basket, (63,) W. C. Higgins 137,368
Bed bottom, (92,) A. Turnbull 137,511
Bed bottom, (93,) A. S. Wells 137,396
Bed bottom, spring, (92) Spencer and Parker 137,496
Bed, spring, (93,) O. C. Campbell 137,287
Bedstead, sofa, (93,) C. Streit 137,505
Bedstead, wardrobe, (93,) R. W. Frost 137,356
Bee hive, (9,) A. Deweese 137,343
Bee hive, (9,) E. Gerry 137,433
Bit adjustable, (39,) F. Jonas 137,373
Boats, detaching, (13,) T. Shaw 137,325
Boiler attachment, wash, (136,) T. Shuman 137,492
Boiler feeder, steam, (148,) A., Jr., and T. C. Spencer 137,497
Boiler feeder and filter, (148,) J. G. Fulton 137,357
Boiler stand and heater, (154,) C. F. Hitchings 137,448
Bolt, expansion, (14,) D. L. Bartlett 137,338
Boot and shoe heel trimming machine, (16,) L. Coté 137,293
Boots and shoes, machine for inserting screw pegs in, (16,) A. Cavalli 137,288
Boots and shoes, machine for finishing the heels of, (16,) L. P. Hawkins 137,304
Box, (63,) E. C. Patterson 137,385
Brick machine, (39,) S. Martin 137,460
Bridge, wooden truss, (21,) T. W. Pratt 137,482
Bromine, apparatus for the manufacture of, (35,) D. C. Turner 137,512
Brush, blacking, (22,) C. W. Maguire 137,376
Brush machine, (22,) E. F. Bradley 137,411
Brush socket, (22,) P. Wagner 137,515
Buckle attachment to harness saddles, (72,) J. B. Welpton 137,519
Buffing machine, (76,) W. W. Messer, Jr 137,465
Bureau, washstand, and wardrobe, combined, (62,) T. W. Moore 137,380
Burial casket handle, (39,) A. G. Chapman 137,289
Burglar proof door, safe, &c., (128,) G. Little 137,456
Bushing, anti-frictional, (87,) F. S. Burr 137,415
Cam grooves, machine for cutting, (100,) George and Houghtaling 137,338
Can for transporting nitro-glycerine, &c., (71,) A. Hamar. 137,439
Cane crusher, hydraulic, (135,) C. H. Dickinson 137,349
Capsules, machine for making plaited, (1,) J. J. Baranowski 137,403
Car coupling, (122,) C. H. Knowlton 137,455
Car coupling, (122,) H. Mulhollen 137,470
Car spring, (122,) D. G. Daniels 137,295
Car spring, (122,) G. F. Godley 137,300
Car strap, street, (121,) M. Warne 137,397
Carbureter, (27,) J. F. G. Kromschroeder 137,307
Carpet stretcher, (62,) D. White 137,522
Carriage axle lubricator, (31,) H. F. Philips 137,479
Carriage axle boxes, manufacture of, (31,) W. J. Parmalee 137,475
Carriage clips, machine for forming, (31,) W. S. Ward.... 137,517
Carriages, dash rail for children's, (31,) M. Hine 137,446
Case for laces, ribbons, &c., (34,) M. Deitzler 137,297
Cattle, apparatus for supplying salt to, (44,) F. Stamberger 137,390
Chain machine, (90,) G. W. Binnix 137,408
Chair, revolving and tilting, (62) D. E. Teal, (reissue).... 5,345
Channeling and edging tool, (16,) L. Bauer 137,404
Chimney, (4,) J. Browell 137,412
Churn, (45,) H. A. Hincheer 137,369
Claw bar, (79,) W. S. Terhune 137,333
Clutch, friction, (87,) S. B. Alger 137,335
Collar, (38,) A. Flatley 137,753
Combing machine, (98,) Smith and Bradley 137,396
Cord covering machine, (17,) Gillespie and Kohn 137,360
Cultivator, (45,) H. H. Perkins 137,478
Curtain fixture, (62,) G. W. Beers 137,405
Curtain fixture, (62,) A. D. and E. M. Judd 137,450
Curtain fixture, (62,) P. W. Phillips 137,480
Curtain fixtures, rack for, (62,) J. Pusey 137,390
Dental use, diamond pointed drill for, (44,) J. P. Gillespie 137,434
Ditching and grading machine, (51,) L. D. Noble 137,318
Door knob guard, (30,) H. Ahrend 137,400
Door plate and indicator, (146,) T. M. and W. F. Tobin.. 137,508
Door spring, (94,) L. J. Higgans 137,367
Dovetailing machine, (143,) W. F. Moody 137,315
Drawers, locking device for a series of, (93,) C. A. Stock.. 137,391
Drill jar, (124,) M. McMullen 137,378
Drill operating machine, (124,) J. W. Stockwell 137,504
Drill, ratchet, (100,) R. Gallagher 137,452
Drilling machine, rock, (124,) F. Johnson 137,372
Earth closet, portable, (9,) A. Panyard 137,319
Elevator, (79,) P. W. Mellen 137,464
Elevators, electrical indicator for, (30,) J. H. Corey 137,422
Engine, dummy, (94,) J. Comly 137,421
Eraser, rubber, (146) E. W. Frost 137 299
Evener, draft, (31,) R. Bunker 137,286
Exercising machine, (143,) L. D. Tice 137,394
Fabric for dress protectors, &c., (37,) J. McMullen 137,311
Fabrics, machine for piling textile, (37,) A. Warth 137,518
Fan, (165,) G. Brueck 137,413
Fire escape, (30,) H. A. Richards 137,483
Fire extinguisher, (35,) J. C. Meehan 137,379
Fire extinguisher, (35,) W. K. Platt 137,481
Fire proof floor, (126,) N. Cheney 137,345
Flask, powder, (55,) T. L. Sturtevant 137,393
Flour, manufacturing middlings, (57,) G. T. Smith 137,495
Flour and middlings, bolt for, (57,) Foreman and Speck .. 137,430
Fruit jar, (58,) J. L. Mason 137,461
Fruit jar cover, (58,) J. L. Mason 137,462
Fruit knife, (44,) G. W. Stevens 137,501
Fruit, tray for drying, (48,) G. W. Stevens 137,502
Furnace, blast, (85,) D. W. Hendrickson 137,366
Furnace, smelting, (99,) B. M. Smith 137,493
Gage, pressure, (148,) J. W. Stiles 137,331
Gas burner, (64,) G. W. Hatch 137,303
Gas burner, revolving attachment for, (90,) J. O. Belknap 137,406
Gas, generator for generating carbonic acid, (35,) J. W. Stanton 137,330
Gas regulator, (64,) P. Keller 137,454
Gas for illuminating, heating, &c., manufacture of, (66,) Whipple and Blunt 137,321
Gas retort charger, (66,) T. F. Rowland 137 497
Gas retorts, apparatus for charging, (66,) T. F. Rowland.. 137,485
Gas retorts, apparatus for raking, (66,) T. F. Rowland.... 137,486
Gas works, sealing dip pipes in, (66,) H. H. Edgerton.... 137,425
Generator for generating carbonic acid gas, (35,) J. W. Stanton 137,330
Gold and silver from base metals, separating, (99,) E. Lundquist 137,375
Grindstones, machine for cutting, (70,) J. P. Gillespie.... 137,435
Gun lock, (55,) W. J. Morris 137,381
Gun, machine, (105,) W. R. Farwell 137,428
Gun, magazine, (18,) A. Swingle 137,392
Hammer, steam drop, (60,) F. B. Miles 137,313
Harness saddles, buckle attachment to, (72,) J. B. Welpton 137,519
Harrow, (73,) H. Weedover 137,520
Harvester, (74,) J. F. Selberling 137,490
Harvester, (41,) E. Taylor 137,506
Harvester, bean, (73,) J. Hinds 137,370
Harvesters, track clearer for, (74,) O. DuBois 137,351
Hinge, (24,) W. I. Ludlow 137,458
Hoops, machine for cutting, (40,) A. G. Parkhurst 137,384
Horse power, (159,) E. Crockett 137,294
Hub, vehicle wheel, (31,) J. Monk 137,314
Hydrant, (167,) F. J. Paul 137,476
Ice, apparatus for making, (83,) G. Willard 137,523
Insect destroyer, (63,) D. G. Mosher 137,469
Iron tender and car frame, (121,) J. W. Goff 137,436
Jack, lifting, (79,) J. S. Halderman 137,263
Lathe carrier, (100,) F. Ferrin 137,298
Levers, adjusting attachment to reversing, &c., (150,) G. W. Jordan 137,374
Lime for the manufacture of artificial stone, treatment of, (153,) J. L. Rowland 137,323
Locomotives, sanding device for, (94,) M. V. Nobles 137,472
Medical compound, (98,) W. A. Ruth 137,488
Metallic case for turbine wheels, (168,) A. Myers 137,471
Middlings receiver, cooler, and duster, (37,) Hunter and Whitmore 137,449
Mill, metallic grinding, (57,) H. B. Stevens 137,503
Mills, hopper and casing for grinding, (57,) J. M. Finch .. 137,429
Millstone bush and spindle, (57,) R. S. Catheart 137,418
Millstone dressing machine, (57,) J. B. Harris 137,364
Mirror, window, (62,) A. and A. Olander 137,383
Nitro-glycerine, manufacture of, (71,) A. Hamar 137,440
Nitro-glycerine, &c., can for transporting, (71,) A. Hamar 137,439
Nut, (14,) W. Van Anden 137 395
Nut lock, (14,) M. L. Ballard 137,401
Nut lock, (14,) Eichenberger and Binkly 137,426
Nut lock, (14,) G. W. Keen 137,453
Nut lock, (14,) I. E. Nagle 137,382
Nut lock, (14,) E. Turner 137,513
Oil still, (47,) W. B. Snow 137,496
Oiler, (57,) C. E. and Z. B. Grandy 137,361
Organ, reed, (106,) A. Dreher 137,350
Packing for piston rods, (151,) J. F. Hermance 137,444
Painter's pot, (107,) T. E. Costello 137,423
Pants, presser block for, (38,) Cohen and Waller 137,346
Paper from walls, removing, (107,) C. F. Ware 137,396
Paper stock, treating fibrous substances for, (108,) T. Routledge 137,484
Piano action, upright, (113,) G. C. Manner 137,377
Pigments containing zinc and lead, manufacture of, (99,) F. Osgood 137,474
Pile driver, explosive, (92,) H. Vogler 137,514
Planter and plow, combined corn, (133,) J. T. McElhiney. 137,309
Printing press, rotary, (117,) C. B. Cottrell 137,347
Projectile, (165,) S. H. Haycock 137,442
Pulley, dynamometer, (87,) I. P. Tice 137,393
Pulley, expanding, (87,) J. E. Fales 137,392
Punching machines, feeding device for, (119,) W. B. Bement 137,407
Purifier, middlings, (57,) E. P. Welch, (reissue) 5,346
Rack, dry goods, (54,) C. N. Cadwallader 137,416
Railroad rail, (120,) H. G. Angle 137,337
Railroad rail, (120,) M. F. McIntyre 137,463
Railway truck, changeable gage, (122,) J. McCauley 137,308
Rake, harvester, (74,) C. S. Truxell 137,510
Rake, horse hay, (77,) R. B. Sheldon 137,389
Refrigerator, (58,) C. O. Peck 137,477
Rubber compound, vulcanized, (84,) W. A. Torrey 137,509
Sad and fluting iron, (91,) J. Hewitt 137,445
Sand ejector, (118,) J. Thayer 137,507
Sash holder, (34,) C. C. Algeo 137,290
Saw filing device, (131,) A. P. Durant 137,424
Saw handle, (131,) M. L. Ballard 137,402
Saw set, (131,) A. and W. Boynton 137,410
Sawing machine, (130,) E. Benjamin 137,294
Scarf ring, (36,) Haack and Diolot 137,302
Scraper, road, (110,) J. Steffensen 137,499
Scraper, wood, (29,) H. D. Spickler 137,329
Screw propeller, (139,) J. Hartman, Jr 137,365
Screw cutting die, (14,) Bates and Murray 137,283
Screw, wood, (171,) S. P. Burdick 137,414

Sewers, apparatus for cleaning, (51,) W. H. Chase 137,290
Sewing machine, (134,) D. H. Regan 137,321
Sewing machine shuttle, (134,) Edwards and Schieder, (reissue) 5,342
Sewing machines, plaiting attachment for, (134,) O. M. Chamberlain 137,342
Sewing machines, box plaiting attachment for, (134,) O. M. Chamberlain 137,343
Shade holder, (99,) M. W. House 137,306
Shaft eccentric, crank, (67,) J. F. Haskins 137,441
Shell, explosive, (105,) J. T. Senn 137,491
Shingling bracket, (126,) L. W. Merriam 137,312
Silk winders, guide for, (17,) J. H. Campbell 137,417
Spark arrester, (94,) W. F. Grassler 137,436
Spike making machine, (163,) D. Eynon 137,427
Spindle step, (142,) J. J. Henry 137,443
Spinning jack, self acting, (142,) A. Paul 137,386
Spinning mule, self acting, (142,) G. O. Wickers 137,334
Spool holder and thread cutter, (38,) A. P. Ayers 137,282
Stalk cutter, (75,) J. and G. Armstrong 137,281
Stencil plate, (54,) F. L. Morrison 137,317
Stone, manufacture of artificial, (153,) J. L. Rowland 137,322
Stone, machine for cutting and dressing, (153,) W. A. Forman 137,354
Stone, treatment of lime for the manufacture of artificial, (153,) J. L. Rowland 137,323
Stove door frame, (154,) S. Smith 137,326
Stove, heating, (154,) G. R. Moore 137,467
Stove, reservoir cooking, (154,) S. W. France 137,355
Stove, reservoir cooking, (154,) H. Stephens 137,500
Stove pipe cover, adjustable, (154,) T. M. Losie 137,457
Stove support, (154,) W. M. Conger 137,291
Stove support, (154,) W. M. Conger 137,292
Stud, lacing, (23,) D. Heaton 137,305
Stump extractor, (79,) E. Colyar 137,420
Sugar drier, (155,) A. Mackey 137,459
Table, extension, (62,) S. E. Wales 137,516
Telegraph apparatus, duplex, (58,) J. B. Stearns, (reissue) 5,344
Tomatoes, drying, (58,) M. P. Smith 137,327
Trap, ant, (63,) T. G. Ames 137,336
Trap sewer inlet, (51,) J. Hitchcock 137,447
Trap, steam, (150,) J. H. Blessing 137,285
Trimming, (38,) O. M. Chamberlain 137,344
Truss, (156,) D. Pomeroy 137,387
Turbine wheels, metallic case for, (168,) A. Myers 137,471
Type setting machine, (117,) C. T. Moore 137,466
Velocipede, (31,) W. Gaffey 137,431
Veneer cutter, (174,) J. N. Selb 137,489
Vessels, propelling, (139,) S. Gerhard 137,359
Vise, (29,) D. Green 137,302
Wagon, road, (31,) C. W. Saladee 137,324
Wagon seat, (31,) E. C. Cole 137,419
Wagons, extension trough for, (31,) A. Ieke 137,371
Wall or window washer, (62,) E. N. Bradley 137,340
Wash tub holder, (91,) A. M. Olds 137,473
Washer, steam, (136,) J. Davis 137,296
Washing machine, (91,) E. Smith 137,494
Watches, mainspring attachment for, (36,) S. S. Morrill .. 137,468
Watches, mainspring safety attachment for, (36,) R. Gove. 137,437
Water proof material, (35,) X. Karcheski 137,451
Water proof, rendering fibrous and textile material, (35,) X. Karcheski 137,452
Water main attachments, stop for, (167,) W. Young 137,399
Water tank, railroad, (150,) J. L. Shaw 137,388
Whip lash, (72,) H. J. Bush 137,341
Wood with rubber, gutta-percha, &c., coating, (84,) Holmes and Albright, (reissue) 5,343
Wrench, (100,) P. E. McIntosh 137,310

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED APRIL 1, 1873.



Adams, H., assignee 137,297
Ahrend, H., Guard for door knobs 137,400
Aiken, H., Alloy for producing ornamental coating on metals 137,279
Albright and Holmes, (reissue) 5,343
Algeo, C. C., Sash holder 137,290
Alger, S. B., Friction clutch 137,335
Ames, T. G., Ant trap 137,336
Andrews, A. C., assignee 137,444
Angle, H. G., Railroad rail 137,337
Armstrong, J. and G., Stalk cutter 137,281
Ayers, A. P., Spool holder and thread cutter 137,282
Ballard, Fast & Co., assignees 137,402
Ballard, M. L., Nut lock 137,401
Ballard, M. L., Saw handle 137,402
Baranowski, J. J., Machine for making plaited capsules.. 137,403
Barbour, J. M., assignee 137,519
Bartlett, D. L., Expansion bolt 137,338
Bartlett, Robbins & Co., assignees 137,336
Bates, S. D., and S. W. Murray, Screw cutting die 137,283
Bauer, L., Channeling and edging tool 137,404
Beers, G. W., Curtain fixture 137,405
Belknap, J. O., Gas burner revolving attachment 137,406
Bement, W. B., Punching machine feeding device 137,407
Benjamin, E., Sawing machine 137,284
Binkly and Eichenberger 137,426
Binnix, G. W., Chain machine 137,408
Birdsall, E. M., assignee 137,497
Bixby, F. N., Tumbling barrel for cleaning castings 137,409
Blakslee, J. B. and C. F., Manufacture of traveling bag frames 137,339
Blessing, J. H., Steam trap 137,285
Blunt and Whipple 137,321
Boynton, A. and W., Saw set 137,410
Bradley and Smith 137,396
Bradley, E. F. Brush machine 137,411
Bradley, E. N., Wall or window washer 137,340
Brandon, D. H., assignee 137,403
Broadaway, W., assignee 137,488
Browell, J., Chimney 137,412
Brueck, G., Fan 137,413
Bunker, R., Draft evener 137,286
Burdick, S. P., Wood screw 137,414
Burr, F. S., Anti-friction bushing 137,415
Bush, H. J., Whip lash 137,341
Cadwallader, C. N., Dry goods rack 137,416
Campbell, J. H., Guide for silk winders 137,417
Campbell, O. C., Spring bed 137,287
Carrington, W. B., assignee 137,342, 137,343, 137,344
Catheart, R. S., Millstone bush and spindle 137,418
Cavalli, A., Inserting screw pegs in boots and shoes 137,288
Chamberlain, O. M., Plaiting attachment for sewing machines 137,342
Chamberlain, O. M., Box plaiting attachment for sewing machines 137,343
Chamberlain, O. M., Trimming 137,344
Chapman, A. G., Burial casket handle 137,289
Chase, W. H., Apparatus for cleaning sewers 137,290
Cheney, N., Fire proof floor 137,345
Clark, H. E., assignee 137,363
Cleveland Non-Explosive Lamp Company, assignee 137,398
Climax Mower and Reaper Company, assignee 137,490
Cohen, L., and J. C. Waller, Pant presser block 137,346
Cole, E. C., Wagon seat 137,419
Colyar, E., Stump extractor 137,420
Comly, J., Dummy engine 137,421
Conger, W. M., Stove support 137,291
Conger, W. M., Stove support 137,292
Cook, F. G., assignee 137,455
Corey, J. H., Electrical indicator for elevators 137,422
Costello, T. E., Painter's pot 137,423
Coté, L., Apparatus for trimming boot and shoe soles 137,293
Cottrell, C. B., Rotary printing press 137,347
Cowles, C., & Co., assignees 137,446
Crockett, E., Horse power 137,294
Daniels, D. G., Car spring 137,295
Davis, J., Steam washer 137,296
Deitzler, M., Case for laces, ribbons, &c 137,297
Deweese, A., Bee hive 137,343
Dickinson, C. H., Hydraulic cane crusher 137,349
Diolot and Haack 137,302
Dore, B., assignee 137,304
Dreher, A., Reed organ 137,350
Du Bois, O., Track clearer for harvesters 137,351
Durant, A. P., Saw filing device 137,424
Edgerton, H. H., Sealing dip pipes in gas works 137,425
Edwards, G. A., and G. Schieder, Sewing machine shuttle, (reissue) 5,342
Eichenberger, J. R., and C. G. Binkly, Nut lock 137,426
Eynon, D., Spike making machine 137,427
Fales, J. E., Expanding pulley 137,352
Farwell, W. R., Machine gun 137,428
Feamster, T. L., assignee 137,466
Ferris, F., Lathe carrier 137,298
Ferris and Miles, assignees 137,313
Finch, J. M., Grinding mill hopper and casing 137,429
Flatley, A., Collar 137,353
Foreman, B. F., and J. P. Speck, Belt for flour and middlings 137,430
Forman, W. A., Machine for cutting and dressing stone.. 137,354
France, S. W., Reservoir cooking stove 137,355
Frost, E. W., Rubber eraser 137,299
Frost, R. W., Wardrobe bedstead 137,356
Fulton, J. G., Feeder and filter for boilers 137,357
Gaffey, W., Velocipede 137,431
Gallagher, R., Ratchet drill 137,432
George, J. S., and W. Houghtaling, Machine for cutting cam grooves 137,358
Gerhard, S., Propelling vessels 137,359
Gerry, E., Bee hive 137,433
Gillespie, J. E., and T. Kohn, Machine for covering cord. 137,360
Gillespie, J. P., Diamond pointed drill for dental use 137,434
Gillespie, J. P., Machine for cutting grindstones 137,435
Godley, G. F., Car spring 137,300
Goff, J. W., Iron tender and car frame 137,436
Going, A. J., Cotton bale tie 137,301
Gove, R., Mainspring safety attachment for watches 137,437
Grandy, C. E. and Z. B., Oiler 137,361
Grassler, W. F., Spark arrester 137,438
Green, D., Vise 137,302
Greene, A. M., assignee 137,481
Haack, J., and S. Diolot, Scarf ring 137,302
Haldeman, J. S., Lifting jack 137,263
Hamar, A., Can for transporting nitro-glycerine 137,439
Hamar, A., Manufacture of nitro-glycerine 137,440
Harris, J. B., Millstone dressing machine 137,364
Hartman, J., Jr., Screw propeller 137,365
Haskins, J. F., Crank shaft eccentric 137,441
Hatch, G. W., Gas burner 137,303
Hawkins, L. P., Finishing boot and shoe heels 137,304

Haycock, S. H., Projectile 137,442
Heald, W. D., assignee 137,361
Heaton, D., Lacing stud 137,305
Heim, J., assignee 137,454
Hendrickson, D. W., Blast furnace 137,366
Henry, J. J., Spindle step 137,443
Hermance, J. F., Packing for piston rods 137,444
Herr, M. L., assignee 137,371
Hewitt, J., Sad and fluting iron 137,445
Heywood Brothers & Co., assignees, (reissue) 5,345
Higgins, L. J., Door spring 137,367
Higgins, W. C., Basket 137,368
Hinchcer, H. A., Churn 137,369
Hinds, J., Bean harvester 137,370
Hine, M., Child's carriage dash rail 137,446
Hitchcock, J., Sewer inlet trap 137,447
Hitchings, C. F., Boiler stand and heater 137,448
Holmes, K. W., and A. Albright, Coating wood with rubber, gutta-percha, &c., (reissue) 5,343
Houghtaling and George 137,358
House, M. W., Shade holder 137,306
Hunter, A., and C. E. Whitmore, Middlings receiver, cooler, and duster 137,449
Huntington, F. A., assignee 137,392
Ickc, A., Extension trough for wagons 137,371
Jakes, J. T., assignee 137 488
Johnson, F., Rock drilling machine 137,372
Jonas, F., Adjustable bit 137,370
Jordan, G. W., Adjusting attachment to reversing levers, &c 137,374
Judd, A. D. and E. M., Curtain fixture 137,450
Karebeski, X., Water proof material 137,451
Karebeski, X., Rendering fibrous and textile fabrics water proof 137,452
Keen, G. W., Nut lock 137,453
Keller, P., Gas regulator 137,454
Kelley, T., assignee 137,416
Kelsey, W. H., assignee 137,354
Knowlton, C. H., Car coupling 137,455
Kohn and Gillespie 137,360
Kromschroeder, J. F. G., Carburetor 137,307
Little, G., Burglar proof door, safe, &c 137,456
Losie Manufacturing Company, assignee 137,457
Louis, T. M., Adjustable stove pipe cover 137,457
Ludlow, W. L., Hinge 137,458
Lufkin, A., assignee 137,321
Lundquist, E., Separating gold and silver from base metals 137,375
Lyon and Fellows Manufacturing Company, assignee 137,303
Mackey, A., Sugar drier 137,459
Maguire, C. W., Blacking brush 137,376
Maloney, J. A., assignee, (reissue) 5,346
Manner, G. C., Upright piano action 137,377
Martin, S., Brick machine 137,460
Mason, J. L., Fruit jar 137 461
Mason, J. L., Fruit jar cover 137,462
McCauley, J., Changeable gage railway truck 137,308
McElhiney, J. T., Combined corn planter and plow 137,309
McIntosh, P. E., Wrench 137,310
McIntyre, M. F., Railroad rail 137,463
Mcmillan, S. D., trustee, assignee 137,451, 137,452
McMullen, J., Fabric for dress protectors, &c 137,311
McMullen, R., Drill jar 137,378
Meehan, J. C., Fire extinguisher 137,379
Mellen, P. W., Elevator 137,464
Merriam, L. W., Shingling bracket 137,312
Messer, W. W., Jr., Buffing machine 137,465
Miles, F. B., Steam drop hammer 137,313
Monk, J., Vehicle wheel hub 137,314
Moody, W. F., Dovetailing machine 137,315
Moore, A. F., Machine for turning axles 137,316
Moore, C. T., Type-setting machine 137,466
Moore, G. E., Heating stove 137,467
Moore, T. W., Combined bureau, wash stand, and wardrobe 137,380
Morgan, W. F., assignee 137,304
Morrill, S. S., Mainspring attachment for watches 137,468
Morris, W. J., Gun lock 137,381
Morrison, F. L., Stencil plate 137,317
Mosher, D. G., Insect destroyer 137,469
Mulhollen, H., Car coupling 137,470
Murray and Estes 137,283
Murray, Dougall & Co., assignees 137,283
Myers, A., Metallic case for turbine wheels 137,471
Nagle, I. E., Nut lock 137,382
National Wire Mattress Company, assignee 137,511
Niles, H. E., assignee 137,589
Noble, L. D., Ditching and grading machine 137,318
Noblee, M. V., Sanding device for locomotives 137,472
Noly, V., assignee 137,288
Olander, A. and A., Window mirror 137,383
Olds, A. M., Wash tub holder 137,473
Osgood, F., Manufacture of pigments containing zinc and lead 137,474
Ostrom, H. P., assignee 137,444
Pannyard, A., Portable earth closet 137,319
Parker and Spencer 137,498
Parkhurst, A. G., Machine for cutting hoops 137,384
Parmelee, W. J., Manufacture of carriage axle boxes 137,475
Patterson, E. C., Box 137,385
Paul, A., Self-acting spinning jack 137,386
Paul, F. J., Hydrant 137,476
Pease, S. W., assignee 137,284
Peak, C. O., Refrigerator 137,476
Perkins, H. H., Cultivator 137,478
Phillips, H. F., Carriage axle lubricator 137,479
Phillips, P. W., Curtain fixture 137,480
Platt, W. K., Fire extinguisher 137,481
Pomeroy, D., Truss 137,387
Pratt, T. W., Wooden truss bridge 137,482
Pusey, J., Rack for curtain fixtures 137,320
Ray, G. O., assignee 137,373
Rice, Barton and Fales Machine and Iron Company, assignee 137,352
Richards, H. A., Fire escape 137,483
Robinson, J. E., assignee 137,455
Rogan, D. H., Sewing machine 137,321
Routledge, T., Treating fibrous substances for paper stock 137,484
Rowland, J. L., Manufacture of artificial stone 137,322
Rowland, J. L., Treating lime for manufacture of artificial stone 137,323
Rowland, T. F., Charging gas retorts 137,485
Rowland, T. F., Apparatus for raking gas retorts 137,486
Rowland, T. F., Gas retort charger 137,487
Ruth, W. A., Medical compound 137,488
Saladee, C. W., Road wagon 137,324
Seib, J. N., Veneer cutter 137,489
Seiberling, J. F., Harvester 137 490
Senn, J. T., Explosive shell 137,491
Schieder and Edwards, (reissue) 5,342
Schwarz, S., assignee 137,491
Shaw, J. L., Railroad water tank 137,388
Shaw, T., Detaching boats 137,325
Sheldon & Co., assignees 137,479
Sheldon, J., assignee 137,411
Sheldon, R. B., Horse hay rake 137,389
Shuman, T., Wash boiler attachment 137,492
Smith, B. M., Smelting furnace 137,493
Smith, E., Washing machine 137,494
Smith, E. S., assignee 137,507
Smith, G. T., manufacturing middlings flour 137,495
Smith, H. D., & Co., assignees 137,517
Smith, L. B., and H., and C. Bradley, Combing machine 137,326
Smith, M. P., Drying tomatoes 137,327
Smith, S., Stove door frame 137,328
Snow, W. B, Oil still 137,493
Spear, J. D., assignee 137,455
Speck and Foreman 137,430
Spencer, A., Jr., and T. C., Steam boiler feeder 137,497
Spencer, W. D., and E. Parker, Spring bed bottom 137,498
Spickler, H. D., Wood scraper 137,329
Squier, G. L., assignee 137,503
Stamberger, F., Supplying salt to cattle 137,390
Stanton, J. W., Generator for generating carbonic acid gas 137,330
Stearns, J. B., Duplex telegraph apparatus, (reissue) 5 344
Steffensen, J., Road scraper 137,499
Stephens, H., Reservoir cooking stove 137,500
Stevens, G. W., Fruit knife 137,501
Stevens, G. W., Fruit drying tray 137,502
Stevens, H. B., Metallic grinding mill 137,503
Stiles, J. W., Pressure gage 137,331
Stock, C. A., Locking device for a series of drawers 137,391
Stockwell, J. W., Machine for operating drills 137,504
Stone, E., assignee 137,315
Straub Mill Company, assignee 137,418
Streit, C., Sofa bedstead 137,505
Sturtevant, T. L., Powder flask 137,332
Swift, C., assignee 137,315
Swingle, A., Magazine gun 137,392
Taylor, E., Harvester 137,306
Teal, D. E., Revolving and tilting chair, (reissue) 5,345
Terhune, W. S., Claw bar 137,333
Thayer, J., Sand ejector 137,507
Tice, I. P., Dynamometer pulley 137,393
Tice, L. D., Exercising machine 137,394
Tobin, T. M. and W. F., Door plate and indicator 137,508
Torrey, U., assignee 137,420
Torrey, W. A., Vulcanized rubber compound 137,509
Townsend, F., assignee 137,285
Truxell, J. S., Harvester rake 137,510
Turnbull, A., Bed bottom 137,511
Turner, D. C., Apparatus for manufacture of bromine 137,512
Turner, E., Nut lock 137,513
Van Anden, W., Nut 137,395
Vogler, H., Explosive pile driver 137,514
Wagner, P., Brush socket 137,515
Wales, S. E., Extension table 137,516
Waller and Cohen 137,346
Ward, W. S., Machine for forming carriage clips 137,517
Ware, C. F., Removing paper from walls 137,396
Warne, M., Street car strap 137,397
Warth, A., Machine for piling textile fabrics 137,518
Welch, E. P., Middlings purifier, (reissue) 5,346
Wells, A. S., Bed bottom 137,398
Welpton, J. B., Buckle attachment to harness saddles 137,519
Wendover, H., Harrow 137,520
Western Union Telegraph Company, assignee, (reissue) 5,344
Weston, T. A., assignee 137,333
Whipple, R. M., and J. G. Blunt, Manufacture of gas for illuminating, heating, &c 137,521
White, D., Carpet stretcher 137,522
Whitmore and Hunter 137,449
Wickers, G. O., Self-acting spinning mule 137,334
Williams J. H., assignee 137,516
Willard, G., Ice making apparatus 137,523
Young, W., Stop for water main attachments 137,399

COMMISSIONER'S DECISIONS.

LITTLE *vs.* STEPHENSON.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Saml. H. Little and John Stephenson for letters patent for* IMPROVEMENT IN STREET-RAILROAD CARS.—*Decided April* 8, 1873.]

COMPLETING INVENTION—ACTUAL USE.

In a controversy between two applicants for patent for improvement applicable to street-cars, where it appeared that one was first to conceive, embody, reveal, and test the invention by experiment and was first to apply for a patent for it, and the other second in all these, was first only in applying the invention to street-cars in actual use: *Held*, that the first had completed the invention before the second conceived it, and priority was therefore awarded to him.

Too much weight must not be attached to the first employment of an invention in actual use. It is important only where it is necessary to establish the date of its being completed.

LEGGETT, *Commissioner:*

The invention sought to be patented by the respective parties to this interference consists in the application of pulleys and continuous cords without weights to the sliding door of a street-car, so that the driver can slide the rear door open or shut from his place on the front platform. Little prefers to employ a pulley and crank which the driver can turn either way to draw the cords, and Stephenson prefers to connect the ends of the cords at the front of the car, like a pair of lines, so that the driver may pull one or the other to open or shut the door. The invention of the parties is the same, viz., the arrangement of the cords or pulleys with respect to the door to enable the driver with one hand to open or close it.

The Examiner of Interferences awarded priority of invention to Little and the Board to Stephenson. Stephenson made the invention in the spring and summer of 1870, and immediately applied it to practical use upon street-cars which he was largely engaged in manufacturing. In July of that year he filed a caveat, which he adopted as his preliminary statement. His proofs are not all admissible under this statement; but as all that he did in making the invention was done during the year 1870, subsequent to what Little did, it is immaterial whether his date be fixed in the spring or summer of that year. The evidence for Little shows that he conceived the invention and made a drawing illustrating it in June, 1869, which, during that year, was shown and explained to several witnesses, among them the superintendent of the Bellefontaine Street Railroad. This drawing is presented as an exhibit, and is fully identified by the witnesses, part of whom had previously signed it at the request of Little for the purpose of identifying it and aiding the proof of the date of the invention. During the year 1869 Little made a large working model, "Exhibit H," nearly the size of the rear end of a street-car with its door, fully illustrating the invention. This was also exhibited and explained to various parties, who from their testimony, show that they understood the principle of the invention and the construction of the device as applicable to a street-car, and as now sought to be patented. Subsequently, in the early part of 1870, Little made two other smaller models, both of which were likewise exhibited, explained, and understood. They only differed from the first in being made in a more workmanlike manner, and in certain minor particulars not affecting the invention. These models are presented as exhibits, and are fully identified. The evidence respecting them bears intrinsic marks of truth, and is not disputed on the part of Stephenson. To my mind these exhibits fully embody, illustrate, and reveal this invention. I cannot understand how, upon a view of them in connection with the testimony, it is possible to say that they do not exhibit the completed invention. If it was completed there was nothing more by way of adopting and perfecting it necessary, and the race of diligence was ended. It was only necessary that it should not be abandoned in order to be patented. It was finished, embodied, op-

erative, communicated to witnesses, and not to be misunderstood. He applied it to actual use as far as it was practicable for him to apply it, and as far as the law requires to make it patentable. There was not a street-car within less than ninety miles of him, so he made in rude form all the parts of a car involved in the invention and necessary to its operation, set them up in his shop, and operated them before his neighbors. Besides this, he expressed his intention to procure a patent. In the fall of 1871 he swears he exhibited his invention at a fair, and in December sent one to his attorneys in this city for patent. He preserved all his models and drawings, took care to have ample proof of his invention, never exhibited any intention to neglect or relinquish it, and without great delay, in fact without any that could under the circumstances jeopardize his rights, he filed his application for a patent January 29, 1872, preceding his competitor by nearly a month. Thus he was first to conceive, first to embody, first to reveal, and first to seek a patent for his invention. Stephenson, second in everything else, was first to apply the invention to use on cars. Why? Because he was a car manufacturer and a man of wealth. Little was a farmer and something of a mechanic and inventor, and comparatively poor. He had no facilities for applying his invention to cars, while Stephenson had the best possible. He did all he could to apply it and test it, and that was enough. I regard the proofs as establishing the fact that the invention was completed by Little in the eye of the law before Stephenson conceived it. In determining the question of "reduction to practice" I think the Board have attached too much importance to the mere matter of putting the invention into actual use upon street-cars. That was a matter depending more upon surrounding facilities than upon inventive genius; more upon money than brains. When Little conceived the idea in its details and mode of application he had done the brain-work; when he made the drawing, built the working models, exhibited them to the world, and explained them so fully and clearly that any one skilled in the art might construct cars embodying the invention, he so far reduced his invention to practice as to comply with the law, and should not be defeated by one later to conceive, later to embody in form and describe, and later to apply for a patent, simply because the subsequent inventor had the conveniences and means to first put the invention into actual use. It is only in those exceptional cases in which actual use is necessarily demanded to establish the date of the completion of an invention that it becomes important in determining the question of priority. No such necessity seems to exist in this case.

The decision of the Board is reversed and priority of invention awarded to Little.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

GEAR *et al. vs.* GROSVENOR *et al.*

[*In Equity.—Before Shepley, Judge.—Decided March* 11, 1873.]

The extension of a patent cannot be impeached for fraud in procuring its issue, in any collateral proceeding, such as a suit on the patent, but only in one instituted directly for setting it aside.

Where a public officer is authorized to grant a patent upon proof which is satisfactory to him that certain pre-requisites have been complied with, his issuing the patent is *prima facie* evidence that they have been, and no recitals to that effect are necessary in the grant.

It is the filing of the petition for an extension which gives the Commissioner jurisdiction over the proceeding, and not the advertisements required by law; whether they have been duly published it is his province to determine.

The construction of a statute which has been adopted for many years by the officers intrusted with its execution is entitled to great consideration.

It seems that publishing notice three times of the day appointed for the hearing of an application for an extension, the first of which is sixty days previous, is a compliance with the law which requires it to be published for sixty days previous.

A conveyance previously executed of an interest in the extension of a patent becomes operative upon the extension being granted, and the title passes thereupon to the purchaser.

The policy of the law seems to require that a patentee applying for an extension should have an interest in it; but an equitable is sufficient, although another holds the legal estate.

A conveyance of all the grantor's "right, title, and interest in letters patent for the full term for which they are or may be granted," without any reference to the extended term, conveys no interest in it.

Although the habendum clause contains the words "to the full end of the term for which said letters patent are or may be granted," the extended term will not pass.

That which is not embraced in the premises of a deed will not pass by being embraced in the habendum clause.

A conveyance of letters patent distinguished from a conveyance of both the letters patent and the invention. (See note.)

The case of *The Nicholson Pavement Co.* vs. *Jenkins*, 1 Off. Gaz., 465, commented on. (And see note.)

The owners of a patent are estopped from prosecuting those who have worked the invention under a license from a third party, relying upon their admissions that he had an interest in it.

But not from prosecuting those who have used the invention after learning that the owners claim an exclusive interest in the patent.

[*B. R. Curtis* and *T. L. Livermore*, for complainants.
B. F. Butler and *Marshall & Rice*, for defendants.]

SHEPLEY, *J.*:

This is a bill for an injunction and account based upon letters patent granted to Nathaniel Gear, November 8, 1853, for a machine for turning and cutting irregular forms, and extended for the additional term of seven years from November 8, 1867.

The answers of the defendants allege that the extension of the letters patent was procured by fraud, misrepresentation, and in violation of law.

It is well settled that a patent from the government cannot in a collateral proceeding be impeached for fraud in procuring its issue; this can only be done in a direct proceeding to set it aside. (*Eureka Co.* vs. *Bradley*, 11 Wallace, 489; *Rubber Co.* vs. *Goodyear*, 9 Wallace, 796.)

Respondents, however, claim that while they are precluded from relying upon any fraud or misrepresentation made to the Commissioner of Patents, while in the lawful exercise of his functions in judicially determining upon a matter in which he had acquired jurisdiction, they have a right to aver and prove the nullity of his decision for want of jurisdiction of the question upon which it is made.

As a matter of fact they contend that the notice, required by law to be published sixty days previous to a hearing before the Commissioner of Patents on an application for extension of letters patent, was fraudulently suppressed and never published in the manner required by law.

Respondents also claim that even if the order and notice in the proceedings for obtaining the extension were published in compliance with the terms of the order of the Commissioner, the publication was not made as required by the terms of the law then in force. The order of the Commissioner was as follows:

"Ordered, that this notice be published in the Republican and the Intelligencer, Washington, D. C., and in the Washington County News, Marietta, Ohio, *once a week for three successive weeks*, the first of said publications to be at least sixty days previous to the day of hearing."

Respondents claim this was not a publication "for at least sixty days," required by the act of 1861. For this reason, as well as by reason of the alleged suppression of the publication of the notice as ordered, it is contended that the Commissioner of Patents never acquired jurisdiction of the subject-matter, and that the extension was granted without authority of law.

If the defense, of want of validity of the extension by reason of informality in the order of notice, or fraudulent suppression of publication of the notice ordered, be one which is open to the defendants in a suit brought for alleged infringement of the extended patent, it may well be doubted whether the allegation in the answer in this case is sufficient to let in the defenses set up. The allegation that "the same was procured by fraud, misrepresentation, and in violation of law," is simply an allegation of a conclusion of law from facts, which facts are not pleaded. There is nothing in the allegation in the answer which would take the defense out of the scope of the decisions of the Supreme Court that the act of the Commissioner cannot be impeached for fraud.

But if the defense were well pleaded in the answer, and the facts were alleged, which are relied upon to establish the fraud and the absence of jurisdiction, I do not think they would avail the defendants in this proceeding.

The act of 1836, chapter 357, section 18, made it the duty of the Commissioner of Patents, whenever a patentee made application in writing to the Commissioner for an extension of his patent beyond the term of its limitation, to cause to be published in one or more of the principal newspapers in the city of Washington, and in such other paper or papers as he may deem proper, published in the section of the country most interested adversely to the extension of the patent, a notice of such application, and of the time and place when and where the same will be considered, that any person may appear and show cause why the extension should not be granted.

The act of 1848, chapter 47, section 1, vested in the Commissioner of Patents, solely, the power to extend patents previously vested in a board composed of the Secretary of State, Commissioner of Patents, and Solicitor of the Treasury, and provided for a reference of the case to the principal examiner having charge of the class of inventions to which the case belongs, after application made to the Commissioner "*and sixty days notice given thereof.*"

The law of 1861, chapter 88, section 12, required all applications for the extensions of patents to be filed at least ninety days before the expiration thereof, "and notice of the day set for the hearing of the case shall be published, as now required by law, for at least sixty days."

As has been previously stated, the Commissioner, in the case of this application, ordered the notice to be published "for three successive weeks, the *first* of said publications to be at least sixty days previous to the day of hearing,"—and the claim is that the publication should have been made for sixty days successively before the hearing, and not having been so ordered or made, the Commissioner had no jurisdiction.

It should here be noted that it appears that the construction put upon the act of 1861 by the Commissioner in this case in ordering the notice was in accordance with the invariable practice of the Office, no change having been made after the passage of that act in the forms of the orders of notice as issued since the passage of the act of 1848.

The construction given to a statute by the officers appointed to execute it, and acted upon by them for a long term of years, though not conclusive, is entitled to great consideration by the court. (*Union Ins. Co.* vs. *Hoge*, 21 Howard, 35–66; *Edwards's Lessee* vs. *Darby*, 12 Wheaton, 210.)

But it is not necessary to place the decision on this ground. The jurisdiction of the Commissioner over the subject-matter commences with the filing of the petition, which makes it his duty to exercise that jurisdiction by causing a proper notice to be published; before such order is issued he must, in the exercise of that jurisdiction, have determined whether the publication should be in one or more of the principal newspapers in Washington; what newspapers in Washington were "principal newspapers" in the sense of the statute; what "other paper or papers he may deem proper" for the publication, in the particular case before him; and what "section of country is most interested adversely to the extension of the patent."

It is plain, from this examination of the statute, that the filing by a patentee of the petition for extension and the payment of the required sum for expenses confers the jurisdiction. The subsequent acts of selecting the papers in which publication shall be ordered, and the number and locality of the papers, and issuing the order, and adjudicating upon the question whether that publication has been made according to law, are all in the exercise of the jurisdiction previously acquired.

It is insisted that the certificate of the Commissioner granting the extension shows upon its face a want of jurisdiction, and that the notices were not given as required by the act of 1861. The certificate of the Commissioner is, that in accordance with the provisions of the act of 1836 and the act of 1848, he "did, on this 30th day of September, 1867, decide that said patent ought to be extended." It contains no recitals respecting the notices issued or the mode of their publication. Such recitals in a patent, whether original, reissued, or extended, are unnecessary. Where, as in this case, an act is to be done, or a patent granted upon proofs to be laid before a public officer, upon which he is to decide, the fact that he has done the act or granted the patent is *prima facie* evidence that the proofs have been regu-

larly made and were satisfactory. No other tribunal is at liberty to re-examine or controvert the sufficiency of such proofs, if laid before him, when the law has made such officer the proper judge of their competency and sufficiency. It is not necessary that the patent should contain any recitals that the pre-requisites to the grant of it have been duly complied with, for the law makes the presumption, and if, indeed, it were otherwise the recitals would not help the case without the auxiliary proof that these prerequisites had been in fact complied with. (*Philadelphia & Trenton R. Co.* vs. *Stimpson*, 14 Peters, 458; *Seymour* vs. *Osborne*, 11 Wallace, 543; *Rubber Co.* vs. *Goodyear*, 9 Wallace, 797; *Stimpson* vs. *Railroad*, 4 Howard, 384.)

The answers of respondents deny the title of the complainants to the extension of the patent.

The deed of Nathaniel Gear, the patentee, to Alonzo S. Gear, one of the complainants, is dated July 10, 1867. It recites the granting of the original patent, that application has been made for an extension, and, for a valuable consideration, assigns, sells, and transfers to Alonzo S. Gear all the right, title, and interest which the grantor has or may have in and to the invention by virtue of the granting of the said extension, followed by the usual *habendum* clause. The extension was granted on the 30th of September, 1867, for the term of seven years from the 8th day of November, 1867. On the 25th of November, 1867, (after the extension was granted,) Alonzo S. Gear conveyed one undivided half of the patent for the extended term to John Gear, the other complainant.

Respondents contend that the assignment of N. Gear to Alonzo S. Gear was delivered before the extension was granted, and that Alonzo S. Gear did not take thereby a vested legal title, but only an equitable interest capable of being perfected by a court of equity, in event of a refusal by N. Gear to perfect it by a subsequent conveyance.

In *Railroad Co.* vs. *Trimble*, 10th Wallace, 380, the Supreme Court held that a conveyance made before a grant of extension became operative upon the right as soon as the extension had been granted, and that by force of such conveyance the legal title in that case, under the extended as well as under the original patent, passed to the grantee.

The act of Congress authorizing extensions of patents undoubtedly contemplated a benefit to the patentee not yet sufficiently rewarded by the receipts from his patent. The policy of the law would seem to require that the patentee applying for the extension should himself have an interest. An equitable interest is sufficient for this purpose, the court having decided that he may convey the legal interest. Such an interest the patentee in this case had, by virtue of the stipulations between himself and his grantee that he should be interested to the extent of one-half of the proceeds from sales or use of the patented invention.

Respondents aver that complainants never had the exclusive ownership of the territory of New York and Massachusetts for the extended term of the patent.

It is clear that complainants have no title to the extended term for the State of New York. Nathaniel Gear, before the conveyance to A. S. Gear, had conveyed his interest in the extension to the New York Circular Molding Company, by a deed in terms embracing all extensions that might be granted of the rights in the patent conveyed.

The rights of the complainants in Massachusetts depend upon a state of facts entirely different. Nathaniel Gear, by his assignment dated April 24, 1854, conveyed to John M. Buell as follows: "All the right, title, and interest I have in *said letters patent* in the following territory, and in no other place or places, to wit, the State of Massachusetts; the same to be held and enjoyed by the said John M. Buell, his heirs and assigns, for his own use and behoof, and for the use and behoof of his legal representatives, to the full end of the term for which said letters patent are or may be granted, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made."

An assignment of an interest in an invention and letters patent therefor before the expiration of the original term, does not carry with it any interest in a subsequently-extended term, unless the assignment contains a specific provision to that effect. (*Wilson* vs. *Rosseau*, 4 Howard, 646; *Bloomer* vs. *McQuewan*, 14 Howard, 539; *Clum* vs. *Brewer*, 2 Curtis, 520.)

The assignment to Buell does not contain any stipulation for an interest in any extended term that might be acquired by the patentee under the acts of Congress. The words in the granting clause are "all the right, title, and interest I have in said letters patent," &c. Referring to the previous recitals in the deed to find the meaning of "said letters patent," we find the recital to be that, "Whereas, Nathaniel Gear, of Zanesville, Ohio, did obtain letters patent of the United States for a machine for turning or cutting irregular forms, which letters patent bear date the 8th day of November, 1853. And whereas, John M. Buell is desirous of purchasing from me an interest therein." Thus far in the granting part of the deed, or in the previous recitals, there is nothing which can with any show of reason be claimed to apply to anything but the term of the patent for fourteen years from the 8th day of November, 1853. The grantor's interest in this patent for the State of Massachusetts was the subject-matter of the grant. Unless certain words in the *habendum* clause can be construed as extending the contract to a subject-matter not before embraced or referred to in the recitals or granting portions of the deed, there can be no doubt as to the intention of the parties. The *habendum* is to Buell and his assigns "to the full end of the term for which *said letters patent* are or may be granted, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made." The claim that the interest in the extended term, either legal or equitable, passed by the deed is based upon these words in the *habendum* clause alone. If the thing granted be only in the *habendum*, and not in the premises of the deed, the deed will not pass it; and therefore if a man grant black acre only in the premises of a deed, *habendum* black acre and white acre, white acre will not pass by this deed. (Sheppard's Touchstone, 76.)

The words "may be granted" must be construed with reference to what precedes them. If not loosely used without any reflection, they may refer to reissues of the patent. As the reissued letters which might be granted would be for the same term as "the said letters patent," such might be referred to by the words "to the full end of the term for which said letters patent are or may be granted," as the letters patent which had been, and the reissues which might be, granted would be for the same term, and that the term described in the previous parts of the deed. An assignment very similar in form to this one has been construed not to carry the interest in the extended term, in a very carefully considered opinion of Judge Sawyer, in the case of *Jenkins* vs. *The Nicholson Pavement Company*, in the Circuit Court of the District of California, not yet reported.

Respondents also claim that complainants have licensed and authorized the defendant, Grosvenor, to make and vend the invention of Nathaniel Gear in the territory of Massachusetts and New York, and have openly encouraged and silently acquiesced in the construction and sale of his machines in those States by both respondents, by printing and circulating handbills and documents signed by them, setting forth that he had the right to construct and vend said invention in those States.

The right in the extended patent for the State of New York is not owned by these complainants. So much of the evidence in the case as relates to alleged infringements in the State of New York may be laid out of the case.

It appears that at one time Grosvenor, having obtained an interest, under the Massachusetts Molding, Wood Cutting, and Turning Company, in the original patent for the State of Massachusetts, supposed that he had thereby acquired an interest in the extended term. The complainants so far acquiesced at one time in this construction of the conveyances as to issue certain circulars, which are introduced in evidence, and which do so far admit that complainants have not the exclusive right for Massachusetts that they would, in the judgment of this court, estop the complainants from prosecuting as infringers any persons who, with knowledge of those circulars and acting upon the admissions therein made, had, upon the faith of those admissions, placed themselves in a condition to be injured by allowing those admissions to be disproved. This would be a defense to a purchaser in Massachusetts under Grosvenor, who purchased and used a machine, acting and relying upon the admission of the complainants. Whether it it would avail the respondents would depend upon the question whether the acts relied upon to prove infringements by them at any given time were after and in consequence of these admissions, and also in reliance upon them, and before they had notice that they were recalled and withdrawn.

The respondents were certainly aware in 1869 that complainants claimed the entire interest and title in the extended term for the State of Massachusetts. The letters of Grosvenor of March 28, and of Lawrence of September 17, 1869, preclude any presumption that they were then acting under any supposed license, encouragement, or acquiescence of the complainants.

The answer alleges that Nathaniel Gear was not the first and original inventor of the thing patented. Respondents rely upon alleged prior knowledge and use by Hazard Knowles, as described in his letters patent granted April 17, 1849, and prior knowledge and use by J. M. Doe, at Cambridge, Massachusetts, by Levi Haywood, at Erving and at Gardner, Massachusetts, and also prior knowledge and use at Princeton, Massachusetts.

Careful examination of the evidence has satisfied me that J. M. Stuart, who testifies to the use of Exhibit I at Princeton, is mistaken as to time, and that this cutter-head could not have been used at the time he supposes, nor in fact at any time prior to the date of N. Gear's patent.

The invention described in the letters patent to Levy assignee of Hazard Knowles, for a tonguing, grooving, and molding machine, clearly did not anticipate the invention of Gear. The round cutter-heads in the Knowles machine had no use except to support the cutters, and did not, like the cutter-head in the Gear machine, serve as a guide or direction to the form or pattern carrying the material to be dressed.

There is much more difficulty and doubt attending the decision on the question of novelty as affected by the evidence in relation to the alleged prior use by J. M. Doe and Levi Haywood.

In relation to the prior use of cutter-heads substantially like those claimed in the Gear patent by Doe and Haywood, there is, especially in Haywood's case, a vast mass of contradictory and irreconcilable testimony. Long and patient and careful examination of this evidence shows the utter impossibility of reconciling the conflicting statements, or of avoiding the conclusion that on one side or the other the witnesses were testifying to matters not within their knowledge or recollection. It would be useless to spread upon the pages of this opinion an analysis which I have carefully made of the many hundred pages in the record devoted to this portion of the evidence. Upon this point I need only state the conclusion to which I have come, not without some hesitation and some regret, that in a case like this of conflicting and contradictory statements from the respective witnesses, the judgment of the court could not have been aided by actual presence before the court of the witnesses on the stand. The complainants are entitled to the benefit of the presumption arising not only from the grant itself, but its unimpaired existence during the original term and its subsequent extension; the burden is upon those seeking to overthrow it for want of novelty to satisfy the court upon that issue, especially in a case like this, where the parties have exercised rights under the patent and claimed interests in it in the original as well as the extended term, and now rely upon evidence as to transactions occurring seventeen or eighteen years before the giving of the testimony to impeach the patent. Under these circumstances the court ought to be fully convinced by a clear preponderance of evidence before declaring a patent void on the ground of prior knowledge and use. The evidence fails to produce a conviction in my mind that prior to the date of N. Gear's patent there was either in the shop of Doe at Cambridge, or of Haywood at Erving or Gardner, or elsewhere, any cutter-head in use embracing the invention described in the claim of that patent.

Decree for an injunction and an account.

NOTE BY THE JUDGE.—"The case of *Nicholson Pavement Co.* vs. *Jenkins*, decided by the Supreme Court of the United States, reported in the OFFICIAL GAZETTE, U. S. Patent Office, vol. 1, No. 20, is not understood as controlling this case, as the *grant* in that case was of '*the said invention* and letters patent.'"

U. S. CIRCUIT COURT—DISTRICT OF MICHIGAN.

HENRY L. BROWN *vs.* JAMES D. HINKLEY AND HIRAM F. COLE.

[*In Equity.—Before Longyear, Judge.—Decided April* 7, 1873.]

In case of a reissue all rights under the original patent cease except as they are secured by the reissued patent.

The claim determines what is patented.

The use of any number of the elements of a patented combination less than the whole, or their equivalents, or what is substantially the same thing, is no infringement.

Where a reissued patent covers a combination which was not covered by the original, the patentee's rights and remedies as to such combination date only from the reissue.

To entitle a patentee to the extraordinary writ of injunction it is not sufficient for him merely to show his patent and an infringement of it. His right must be further substantiated in one of two ways: 1, by a possession accompanied by an actual use and enjoyment of the right for a sufficient length of time to afford a reasonable presumption of the acquiescence of the public in its validity; or, 2, by a judgment in his favor in a trial at law. The latter, however, is never necessary where the former exists.

A reissued patent covering a combination not covered by the original, issued less than two months before the filing of the bill, and unaccompanied by any actual use and enjoyment of the thing patented, held not sufficient to entitle the patentee to an injunction to restrain an alleged infringement without a trial at law and judgment in his favor.

Motion for a preliminary injunction to restrain an alleged infringement of a patent right on the bill of complaint and accompanying affidavits. The bill alleges that the invention in question is a new and useful improvement in hand-cars for railroads, and that a patent therefor was duly issued to the complainant September 7, 1869, and was reissued in two divisions February 11, 1873. The nature of the invention, as set up in the specifications accompanying the original patent, is to obtain greater speed "by means of a peculiar arrangement of sliding pinions connected with the driving-shaft and fixed pinions on an additional crank-shaft, whereby a large pinion on the driving-shaft is made to engage a small one on the crank-shaft, and vice versa." The claim is in the following words:

"What I claim as my invention, and desire to secure by letters patent, is, the arrangement of the double clutch W, pinions U and V, crank-shaft R, and pinions S and T, substantially as and for the purposes set forth."

This patent was surrendered and canceled and a reissue was granted in two divisions, A and B. In division A the nature of the invention is described the same as it was in the original. The claim is substantially the same, only it is set forth with more particularity. The claim is as follows:

"1. In a hand-car, a double crank-shaft carrying two driving-wheels of unequal size in combination with the pinions and double clutch, arranged upon the axle substantially as set forth.

"2. In a hand-car, the combination of a double crank carrying two driving-wheels of unequal size with suitable mechanism on the axle, so that the speed can be changed at will, substantially as set forth."

In division B the nature of the invention, as described in the specifications, "relates to the construction of a lever-power for running hand-cars and all similar purposes; and consists in two hand-levers fulcrumed upon the same shaft, one of which has a short dependent arm near its center, so that when the two levers are extended horizontally on a plane with each other the end of this arm and the end of the other lever to which the ends of the connecting-rods are attached will be of the same length and upon the same side of the shaft, thus requiring less room to operate them and making the connecting-rods by which they are attached to the double crank of the same length." The claim in this division is as follows:

"The combination of the levers c d, connecting-rods e, and double cranks, when the parts are arranged to operate substantially as described."

The allegations of the bill as to infringements concede that in the combination used by the defendants the two driving-wheels covered by complainant's combination patented by division A of the reissued patent are omitted, one driving-wheel only being used. As to the combination used by defendants covered by division B of the reissued patent, the allegation is as follows: "retaining, however, the double lever, double crank, and two pitmen of your orator's improvement, and, indeed, everything that is contained in the description and specification accompanying division B of the said reissued letters patent." And the affidavits accompanying the bill are to the same import in both of the particulars above mentioned.

It is distinctly stated in the bill that complainant has not manufactured or sold any cars, or in any manner put his invention to use since the reissue of his patent.

[*Mr. Millard*, for complainant.
Mr. Hunt, for defendants.]

LONGYEAR, *J.*:

The original patent having been surrendered and canceled, all rights under it have ceased, except as they are secured by the reissued patent. *Moffit* vs. *Gaar et al.*, 1 Fish, patent case, 610. Our attention, must, therefore, be confined to the reissued patent.

In order to ascertain what it is that is patented, we look to the claim. Looking at the claims accompanying both divisions of the reissued patent, we find that it covers (as did the original) combinations only, no one or more elements of which are claimed or patented as new. It is a well-settled rule of law, which does not need citation of authorities to prove, that the use of any number of the elements of a patented combination less than the whole, or their equivalents, or what is substantially the same thing, is no infringement. The use of two driving-wheels of unequal size in the combination covered by division A of the reissued patent is a material element, and those being omitted in the combination used by defendants, and nothing being substituted for them which can produce the same result, there is clearly no infringement of said division A made out by the bill. On the contrary, any such presumption is rebutted by the express allegations of the bill.

The bill does, however, show *prima facie*, at least, an infringement of the combination covered by division B of the reissued patent. But here we meet insurmountable obstacles to granting the relief by injunction in the present posture of affairs. The combination covered by division B was not covered by the original patent; therefore the complainant's rights and remedies as to it date only from the date of the reissue. As to it complainant is in no better position than if the reissue was an original patent instead. *Poppenhusen* vs. *Falke*, 2 Fish Pat. Cas., 181.

To entitle a patentee to the extraordinary writ of injunction it is not sufficient for him merely to show his patent and an infringement of it. His right must be further substantiated in one of two ways: First, by a possession accompanied by an actual use and enjoyment of it for a sufficient length of time to afford a reasonable presumption of the acquiescence of the public in its validity; or, second, by a judgment in his favor in a trial at law. The latter, however, is never necessary where the former exists; but I understand it to be essential in all cases that there should be a trial at law in the absence of such use and enjoyment. This has been the rule in England for more than a century, and it has always been the rule in the United States. The decisions by which the rule is established, and the reasons upon which it is based, are too numerous to be cited here. The cases of *Ogle* vs. *Ege*, (4 Wash. Circuit Court Reports, 584,) by Associate Justice Washington, in 1826, and *Motte* vs. *Bennett*, (2 Fish Pat. Cas., 642,) by Associate Justice Wayne, in 1849, are cited as leading cases on this point. In the latter case, Mr. Justice Wayne, after a thorough review of the authorities, English and American, deduces the rule substantially as above laid down. At page 659 he says: "In equity, where the case is clear and without reasonable doubt, where the bill states a clear right to the thing patented, which, together with the alleged infringement, is verified by affidavit, and where the plaintiff has been in possession of it, by having sold or used it in part or in the whole, the court will grant an injunction and continue it till the hearing or further order, *without sending the plaintiff to law to try his right.*" In that case it had been contended that a previous trial at law was essential in *all* cases, and the learned justice was showing that such was not the case and that it was never necessary where the other conditions named existed, but clearly conceding the necessity where those conditions or any of their essential elements were wanting. See especially pages 655 and 656.

In this case the patent has not been issued quite two months, and confessedly complainant has put his rights under it to no use whatever, even during that short time, and there has been no trial at law. I do not think a well-considered case can be found in the books where a preliminary injunction has been granted under such circumstances.

There are other objections which might be enumerated, such as the entire want of any verification whatever, by affidavit of complainant's right, under division B of the reissue, the want of the requisite degree of the right kind of knowledge of the persons swearing to the affidavits as to the alleged infringement, and the unsatisfactory nature of the contents of the affidavits; but after the views above expressed a full consideration of those objections is unnecessary. I shall therefore let this brief notice of them suffice.

The motion for a preliminary injunction is denied, with costs of the motion to the defendants.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.*—Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,096.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSE, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,364.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 4, 1873. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABBATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHEBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,686.—*Machines for Boring and Mortising Blind Slats.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,709.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,724.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Curling-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

DISCLAIMERS FILED.

23,635.—CORNELIUS W. WILLIAMS.—*Improvement in Gates for Canal-Locks*, granted April 12, 1859. Disclaimer filed April 12, 1873. Disclaims:

"That part of the claim in the specification which is in these words, to wit:

"'Third. Securing the bearings or boxes *f* to the lock A by means of the rods A, the boxes being attached to [the] slides *i*, and arranged substantially as shown, so that the boxes may be adjusted as occasion may require.'"

EXTENSIONS GRANTED.

8,654.—*Improved Ornamental Connection of the Parts of an Iron Fence*, granted to HENRY JENKINS, January 13, 1852; reissued September 6, 1859, numbered 807, and extended seven years. (LOUISA JENKINS, widow.)

Claim.—Forming the ornament or cast-iron connections for a railing, fence, or other article of iron cast into a divided iron-mold, substantially as and for the purposes specified.

23,642.—*Improvement in Obtaining Fibers from Waste Felted Fabrics*, granted to JOHN F. GREENE, April 12, 1859; reissued October 10, 1865, numbered 2,066.

Claim.—1. Subjecting the felts to be disintegrated to the successive and combined action of steam and picking, substantially as described, the steam having the effect either to unfelt or so loosen the hold which the fibers have on each other in felted fabrics that they can be drawn apart of sufficient length to be advantageously employed in the manufacture of other felts or other fabrics.

2. Subjecting the felts which are to be disintegrated to the action of steam for the purpose of loosening the fibers preparatory to the action of the machinery, as hereinbefore described.

3. The application of sal-soda or other equivalent chemical agent, in solution, with heat for the purpose of extracting the glue, mastic cement, or gums from the felts, in the manner hereinbefore described.

23,643.—*Improvement in Machinery for Disintegrating Waste Felt Fabrics*, granted to JOHN F. GREENE, April 12, 1859.

Claim.—The combination of the steaming apparatus and the picker, substantially as described, for steaming the felt as it passes to the picker to be disintegrated, as set forth.

23,692.—*Improvement in Cooking-Stoves*, granted to PHILO P. STEWART, April 12, 1859; reissued May 17, 1864, numbered 1,673; reissued April 7, 1868, numbered 2,915. (ELIZA C. STEWART, administratrix.)

Claim.—1. The method or the means, substantially as herein described and set forth, of preventing heat from passing through to the rising-flue, leading to the chimney, by separating it from the back oven-plate, and from the descending-flues by non-conducting partitions, or the equivalents therefor, and for the purpose herein set forth.

2. I also claim the employment of a double damper, filled in with cement or other equivalent non-conducting material, in combination with the flue above the oven and with the rising-flue leading to the chimney, in the manner substantially as and for the purposes herein described and set forth.

3. I also claim the separating of the direct-sheet flue, under the oven, from the return-sheet flue, immediately below the same, by means of the dividing-flue plate *i*, or any equivalent therefor, constructed, arranged, and combined with the said sheet-flues in the manner, and by the means, and for the purposes substantially as herein described and set forth.

4. I also claim the dividing of the space between the bottom plate of the oven and the bottom plate of the stove by means of the inclined dividing-flue plate *i*, or any equivalent therefor, in the manner and for the purposes substantially as herein described and set forth.

5. I also claim the employment of the space or chambers S', in combination with the outer edge of the oven-bottom plate, and with the back-end oven-plate, in the manner and for the purposes substantially as herein described and set forth.

6. I also claim the sheet-flue division-plate *i*, having a recess, *h'*, at each front corner thereof, and the projection A between such recesses, substantially as and for the purposes herein described and set forth.

7. I also claim the employment of a broad or sheet-flue division-plate, *i*, or any equivalent thereof, in combination with the oven and oven-bottom flues, in the manner and for the purposes substantially as herein described and set forth.

8. I also claim the additional bottom plate or encasement *r*, in combination with the broad sheet-flue *i*, or any equivalent therefor, in the manner and for the purposes substantially as herein described and set forth.

23,635.—*Improvement in Gates for Canal-Locks*, granted to CORNELIUS W. WILLIAMS, April 12, 1859.

Claim.—1. The rods C C and rack D applied to the gate B B, for the purpose set forth.

2. Having the journals *c* of the gates fitted in oblong slots *d* of pulleys *e*, which are placed in suitable bearings or boxes *f*, and arranged substantially as shown, to admit of the sagging of the gates and the close fitting of the same when closed, for the purpose specified.

3. Securing the bearings or boxes *f* to the lock A by means of the rods h, the boxes being attached to slides *i* and arranged substantially as shown, so that the boxes may be adjusted as occasion may require.

4. Operating the wickets H H by means of the gearing, arranged as described, whereby either wicket may be operated from one and the same crank-shaft *q*.

Disclaimer filed April 11, 1873.

Disclaims third clause of claim, as above set forth.

23,598.—*Improved Screw-Propeller*, granted to JAMES MONTGOMERY, April 12, 1859.

Claim.—A screw-propeller composed of a plurality of blades attached to their shaft in one plane, or nearly so, when surrounded by a containing-cylinder firmly attached to the peripheries of the said blades, substantially in the manner and for the purposes set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date April 8, 1873.]

6,558.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed April 1, 1873.

6,559.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed April 1, 1873.

6,560.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed April 1, 1873.

6,561.—*Carpet.*—RICHARD CARLTON, Liversedge, England, assignor to W. & J. SLOANE, New York, N. Y. Application filed February 15, 1873.

6,562.—*Carpet.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Application filed April 1, 1873.

6,563.—*Carpet.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Application filed April 1, 1873.

6,564.—*Carpet.*—JOSEPH M. CHRISTIE, Brooklyn, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Application filed April, 1, 1873.

6,572.—*Trimming.*—JOHN B. CLARKE, Brooklyn, N. Y. Application filed March 22, 1873.

6,573.—*Printing-Types.*—JAMES M. CONNER, New York, N. Y. Application filed March 15, 1873.

6,574.—*Printing-Types.*—JAMES M. CONNER, New York, N. Y. Application filed March 15, 1873.

6,575.—*Carpet.*—JOHN HAMER, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed April 1, 1873.

6,576.—*Carpet.*—JOHN HAMER, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed April 1, 1873.

6,577.—*Fork and Spoon Handle.*—MARTIN H. MOSMAN, Waterbury, Conn. Application filed January 25, 1873.

6,578.—*Carpet.*—CHARLES A. RIGHTER, Philadelphia, Pa., assignor to DORNAN, MAYBIN & CO., same place. Application filed March 27, 1873.

6,579.—*Carpet.*—CHARLES A. RIGHTER, Philadelphia, Pa., assignor to DORNAN, MAYBIN & CO., same place. Application filed March 27, 1873.

6,580.—*Plant-Stand.*—JOHN R. ROBERTSON, Syracuse, N. Y. Application filed January 23, 1873.

6,581.—*Carriage-Pole Trimming.*—ANSON SEARLE, Newark, N. J. Application filed January 16, 1873.

6,582.—*Revolving Bottle-Stand.*—THOMAS P. SPENCER, Morrisania, N. Y. Application filed March 14, 1873.

6,583.—*Paper-File.*—ELDRIDGE J. STEELE, New Haven, Conn., assignor to SARGENT & CO., same place. Application filed March 12, 1873.

6,584.—*Coffin-Handle Socket.*—JAMES S. RAY, East Haddam, Conn. Application filed March 24, 1873.

6,585.—*Knife, Fork, and Spoon Handle.*—WILLIAM ROGERS, Hartford, Conn., assignor to LUCY J. ROGERS, same place. Application filed March 22, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date April 8, 1873.]

1,199.—*Hams and Cured Meats.*—WILLIAM G. BELL & COMPANY, Boston, Mass. Application filed March 27, 1873.

1,200.—*Bottles of Brandy.*—CAZADE & CROOKS, New York, N. Y. Application filed February 8, 1873.

1,201.—*Glass-Ware.*—THOMAS G. COOK & CO., Philadelphia, Pa. Application filed March 18, 1873.

1,202.—*Paints and Colors.*—HARRISON BROTHERS & CO., Philadelphia, Pa. Application filed March 28, 1873.

1,203.—*Baking-Powder.*—JESSE H. LIPPINCOTT, Pittsburg, Pa. Application filed March 21, 1873.

1,204.—*Bitters.*—JOSEPH CLEVE, Boston, Mass. Application filed April 1, 1873.

1,205.—*Trimmings for Ladies' Wear.*—ERSKINE & COMPANY, New York, N. Y. Application filed March 15, 1873.

1,206.—*Medical Compound.*—JOHN H. HOPKINS, Providence, R. I. Application filed November 22, 1872.

1,207.—*Whisky.*—MOREHEAD, YOUNG & CO., St. Louis, Mo., and Leavenworth, Kans. Application filed April 2, 1873.

1,208.—*Rubber Paint.*—THE RUBBER PAINT COMPANY, Cleveland, Ohio. Application filed March 3, 1873.

1,209.—*Rubber Paint.*—THE RUBBER PAINT COMPANY, Cleveland, Ohio. Application filed March 3, 1873.

1,210.—*Lozenges and Syrup.*—TOWNSEND & CO., New York, N. Y. Application filed February 15, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date April 8, 1873.]

ORIGINAL PATENTS.

137,524.—*Apparatus for Cutting Cigar-Wrappers.*—REMSEN APPLEBY, Beverly, N. J. Application filed December 23, 1872.

The tobacco-leaf to be cut is laid upon a block having a cutter of the desired shape, projecting slightly upward; a roller is then passed over the leaf. A hinged gage is employed to hold down the leaf while it is being cut, and to gage the length of the wrapper, being movable on its hinge longitudinally with the wrapper.

Claim.—1. The cutter A having the form of a cigar-wrapper, arranged and operated, in connection with the roller D, as and for the purposes described.

2. The adjustable hinged gage C, for the purpose of holding the wrapper and of gaging it at different lengths, as shown and described.

137,525.—*Construction of Sheet-Metal Elbows.*—LAFAYETTE RANUHOFF, Springfield, Ohio, assignor of two-thirds his right to L. BROWN and W. G. BRYANT, same place. Application filed August 21, 1872.

The beveled sections are constructed with beads extending only partially around them, with a view to preventing them from turning upon each other, at the same time that they fit together firmly without bolts or rivets.

Claim.—An elbow or curved section of pipe, the beveled portions of which are joined together by means of beads, which extend only partially around the same, substantially as and for the purpose set forth.

137,526.—*Skate.*—EVERETT H. BARNEY, Springfield, Mass. Application filed January 21, 1873.

When the boot-heel is placed upon the heel-plate, and the screw is turned in, the clamp is drawn back against the front of the heel of the boot, and thus forces the boot heel back against the permanent upright projections upon the heel-plate, and the boot-heel is grasped firmly between the face of the clamp and the projections, both the clamp and the projections being provided with sharp points.

Claim.—1. The brackets *f*, forming an intermediate support for the heel-plate, and made in two parts, as described, in combination with said heel-plate A, the whole forming a socket within which the heel-clamp is operated, substantially as described.

2. The combination of the double plates *e*, provided with recesses *s* and secured to the heel-plate A, with the screw *d*, having the collar *e* thereon, substantially as and for the purpose described.

3. The beveled pieces *i*¹ having the shanks *i*² thereon, and secured to the foot-plate of a skate, constructed and arranged substantially as shown, and serving as the bearing or guides for the foot-clamps, as herein set forth.

137,527.—*Pump.*—WILLIAM D. BAXTER, New York, N. Y., assignor to SANDS & BAXTER, same place. Application filed February 7, 1873.

To prevent the water from freezing in the pump when not in use, a double-acting cock is placed between two cylinders, by which the water is drawn from the whole upper part of the pump down into the reservoir and outlet-pipe below with one movement of the cock.

Claim.—The double-acting hollow cock C with openings I, J, K, and L, cylinder F with pipes or channels A, B, D, and E, in combination with the pump-cylinders *d d*, reservoir R, and inlet-pipe *b*, substantially as and for the purpose hereinbefore set forth.

137,528.—*Wax-Thread Sewing-Machine.*—EDWIN R. BEAN, Boston, and FRANK BEAN, Medford, Mass. Application filed November 11, 1872.

The tension-roller and disk are mounted on an arm pivoted on a pin projecting from the overhanging arm. On this same pin is an elbow-lever or knee, connected at one end with a reciprocating rod, having secured to it a spiral spring and movable nut, between which bears the end of the lever that moves the rod. A projection or stop from the presser-foot bar receives the end of the roller-carrying arm when the presser is in its lowest position, and this arm is thrown to its position by the action of the lever against the spring on the rod, the spring allowing a yielding connection between the parts so as to adapt the arm to the position of the stop on the presser-shank, which varies with the thickness of the material. At the backward movement of the rod, which is positive, one end of the elbow-lever or knee presses against the disk and prevents it from turning as the arm and roller rise and draw on the thread. The drawing shows the irregularly-slotted pivoted arm moved by the crank-pin and the connecting-links for rocking the needle and operating rock-shafts.

Claim.—1. The tension-roller *w*, disk *r*, arm *t s*, and knee *q q'*, in combination with the rod *m*, spring *p*, levers *l i*, cam *h*, and the presser-foot bar 3 with its stop 4, all constructed and arranged substantially as and for the purpose set forth.

2. The mechanism for adjusting the needle centrally with the awl, consisting of the slotted lever 7 attached to the shaft 6 and adjusting-screw 13, or their equivalents, as and for the purpose shown and described.

3. The mechanism for adjusting the feed-post in a vertical plane, consisting of the screws 12 12 tapped through the lever 7 and resting in recesses made in the shaft 6, as shown and described.

4. The combination, with a needle-bar and awl-bar, of the single crank *g* and its connecting mechanism for imparting the respective movements to the said bars.

5. The spring 36, arranged to slightly elevate the cast-off bar, to prevent the escape of the loop from the needle as it begins to rise, as described.

6. The combination, with a needle-awl and thread-guide, of a single cam-disk, 18, and its connected mechanism for imparting the respective movements to the said parts.

7. A shaft, 21, with its seat 49, in which the adjustable screw 50, tapped through the arm 47, rests, for the purpose of adjusting the position of the arm in relation to the shaft 26, as herein shown and described.

137,529.—*Device for Cleaning Wells.*—WILLIAM F. BROWN, Hardin county, Ky., assignor of two thirds his right to WILLIAM F. COOMBS and BENJAMIN HOWSLEY, same place. Application filed October 21, 1872.

The bucket has hinged doors at the bottom, which can be closed, when the machine has been lowered into the sand, by

means of the notched bar and balls. A spring, which engages with the notches on the bar, holds the box closed until drawn up and released. Valves permit the exit of air and shut out water from the lead, said water flowing off through holes in the sides.

Claim.—The combination of the box A A with its folding caps B B, keys C C, cords D D, bar E, balls F F, notches G G, spring H, cord I, partitions J J with their openings K K K K, valves L L, slides N N, thumb-screws O O, rope P, pipe-box R, and openings S S, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

137,530.—*Bee-Hive.*—DAVID MCCONAHEY CALVIN, East Fallowfield, Pa. Application filed February 17, 1873.

A pyramidal frustum forms the hive, its base fitting closely within a rectangular external case. The combs are built from the top down, the laborers requiring the maximum of space at the completion of the work and the minimum at the beginning of the work and at the exhaustion of the honey. The space between the hive and case for air in summer and for packing in winter is hence graduated to the requirements of the seasons.

Claim.—I claim the hive proper B, forming a frustum of a pyramid, in combination with the rectangular external case A, when the same are constructed as described, for the purposes set forth.

137,531.—*Uterine Supporter.*—HORATIO N. CARR, Freeport, Ill. Application filed February 15, 1873.

The stem of the pessary has an upward and outward curve, and is attached at its lower end by a hinged adjustable joint to a frame, which extends entirely around, and without touching the external genitals, thus relieving them from the pressure, less or greater, which they usually sustain under the ordinary arrangement of the supporting-frame.

Claim.—The frame A A, constructed so as to extend around the labia pudendi and the mons veneris, in combination with cup-stem D, having upward and outward curves, and attached to the lower part of the frame by an adjustable hinge, substantially as described.

137,532.—*Burglar-Alarm.*—JOHN F. COPPOCK, West Newton, assignor to JOSEPH D. VINNEDGE, Indianapolis, Ind. Application filed December 23, 1872.

A ratchet-bar is attached to one of the window-sashes, and a plate carrying a bell with a spring-hammer having a projecting heel is attached to the other sash, in such manner that if either sash be opened or moved the passage of the hammer-heel over the ratchet-bar will sound the bell.

Claim.—The burglar-alarm consisting of the case C, supporting the bell F, and the hammer D J, with spring-arm E I, in combination with the ratchet-bar H, all constructed and arranged substantially as and for the purpose set forth.

137,533.—*Method of Constructing Paper Bags.*—LUTHER C. CROWELL, Boston, assignor to JOHN SMITH, same place, and LUTHER CRANE, Cambridge, Mass. Application filed August 16, 1872.

Claim.—The method of making paper bags, consisting in lapping and cementing the sides or edges of a band of paper so that the intermittent lines of paste *a a* shall be between the lapped edges E for a distance equal to the length of the bag to be made, applying a continuous line of paste, *b b*, to the outer surface of said contiguous lapped edges, folding said lapped and pasted band of paper in a continuous series of folds, as shown at A B, Figs. 1 and 2, completing the construction of said bags by making the cut S across the end of the folds, as shown at Fig. 14, for the purposes herein shown and described.

137,534.—*Railroad Gate.*—CHARLES S. CURRIE, Caldwell, Ohio, assignor of one-half his right to JONATHAN DILLEY, same place. Application filed August 26, 1872.

The wheels of the train depress the pressure-rails, guarded at their extremities by rollers. The movement of the pressure-rails opens the gate through the levers E, and chain passing around the gate-pivot and at the same time operates the latch through a rod. Springs restore the gate and pressure-rails to their normal position.

Claim.—1. The railroad gate B, poised at N and made to open and close by the traction of the springs D D′ and chain Q, in the manner substantially as set forth.

2. The combination of the pressure-rails K, provided at the ends with rollers L, levers E, rods M, lever F, chain J, springs D and D′, chain Q, and post N, for the purpose of opening and closing the gate B by the action of car-wheels on the pressure-rails K, all substantially as set forth.

3. The combination of lever F, rod G, chains I, and latches H, for fastening and releasing the gate B, substantially as set forth.

4. The springs D D′ and lever F, in combination with the rails K K and levers C, for the purpose of raising the pressure-rails K above the track.

137,535.—*Railroad Switch.*—HENRY S. DEWEY, Chicago, Ill., assignor of one-half his right to MICHAEL W. WOLF, same place. Application filed September 20, 1872.

A crooked switch-rail is employed instead of the usual straight one, so that the shock of change of direction of motion shall not occur till the locomotive is fairly on the rail, when it is expected to resist by its weight the tendency to lateral displacement of the rail.

Claim.—The combination of the crooked rails A A with the switch-rails E E, side track N N, switch-bar G G, frogs B B, and frog-guard F, substantially as and for the purposes hereinbefore set forth.

137,536.—*Horse-Brush.*—ROBERT DICKSON, Lansingburg, N. Y. Application filed March 25, 1873.

The back of the brush is bored at alternate slants, so that the tufts or knots shall slant inversely toward the others.

Claim.—In the construction of brushes, the slanting together of the inner rows of knots or tufts, so as to abut against each other at the tops or points, substantially as set forth and described.

137,537.—*Shirt-Collar.*—ORLANDO P. DORMAN, New York, N. Y. Application filed January 11, 1873.

Facing a collar made of ordinary collar-paper with a peculiar parchment-paper, and also patching the button-holes of paper-collars with parchment-paper.

Claim.—As a new article of manufacture, the herein-described collar composed of collar-paper and parchment-paper, substantially as described.

137,538.—*Street-Lamp.*—MICHAEL B. DYCTT, Philadelphia, Pa. Application filed June 10, 1872.

The globe is secured between two rings. Between it and the bottom ring is placed a yielding packing of cloth or like substance. The upper ring has upon its inner surface springs, which bear against the globe. Above the globe is placed a dome to form an annular cold-air space between it and the globe. Over the openings through which the current of cold air passes, and over the draft-openings, are placed auxiliary domes to prevent entrance of rain, &c.

Claim.—1. The ring B with its series of springs 2 2, and the ring D with its elastic packing *d′*, in combination with the frame of the lantern, substantially as set forth, for the purpose of supporting the glass globe C, in the manner described.

2. The dome A and glass globe C, in combination with the ring B and its series of springs 2 2, the same being constructed and arranged to operate together as and for the purposes hereinbefore set forth.

3. The combination of the glass globe C, its chimney *c′*, the dome A, and the air-space between the said globe and dome with the deflecting weather-bonnets E and F, the said parts being arranged substantially as and for the purposes hereinbefore set forth and described.

137,539.—*Clasp for Stocking-Supporters.*—STEPHEN K. ELLIS, Waltham, Mass. Application filed March 10, 1873.

Claim.—The within-described clasp for stocking-supporters, consisting of the spring-jaws *b e* with or without teeth, and one overlapping the other, in combination with the slide *a* and one or more projections, *g*, or equivalent device, for holding the slide when down, all constructed and operating substantially as set forth.

137,540.—*Safety-Valve.*—EDWARD C. FERNALD, Flatbush, N. Y. Application filed January 8, 1873.

The steam raises the weighted tube until an orifice in the latter registers with an opening in its surrounding case. Each section of the vertical boiler is provided with one of the valves.

Claim.—A safety-valve constructed with a weight, G, and a stem, *e*, combined with a tube, K, fitted with a seat for said stem *e*, and provided with steam-vent *n*, substantially as shown and described, and for the purpose set forth.

137,541.—*Feed-Water Regulator.*—EDWARD C. FERNALD, Flatbush, N. Y. Application filed January 8, 1873.

A valve in a lower chamber is connected by an adjustable rod to a float in an upper chamber. An alarm-rod is attached adjustably to a sleeve on the float-rod, which sounds an alarm when the water is too low. When the valve is opened by the falling of the water a communication is made with the feed to admit more water.

Claim.—1. The water-pipe A provided with valve O, valve-stem H, and float in float-chamber J, combined with alarm *e* and alarm-rod N, all arranged and operating in the manner set forth.

2. The combination with the valve O and float with their connecting valve-rod H, in two parts, joined by the sleeve F provided with binding-screws for the ready adjustment of said rod as to length.

3. The alarm-rod N attached to sleeve F, combined with valve-rod H, so that the adjustment of said rod may be secured without changing the adjustment of the alarm-rod N.

137,542.—*Medical Compound.*—HENRIK GAHN, Upsala, Sweden. Application filed February 1, 1873.

Claim.—A compound called amykos, composed of a decoction of glycerine, cloves, borax, and soda, substantially in the proportions specified.

137,543.—*Crimper for Boots and Shoes.*—CHRISTIAN GLANTZ, Baltimore, Md. Application filed February 21, 1873.

The movable foot-piece is attached to the leg-section of the boot-tree by means of a jointed arm and slotted curved plates. Curved or arched cap-plates cover the instep portion of the tree, overlapping each other and forming a continuous surface when the two sections are separated.

Claim.—1. In a boot and shoe crimper, the foot-section A thereof, connected to the leg-section B by means of the arc-shaped slotted side plates D, studs F F′, and hinged arm V to produce an extensible foot-piece, substantially as described.

2. The arched overlapping instep cap-plates C C′, in combination with the leg and foot sections A B to produce a closed extensible joint at the junction of said sections, substantially as described.

3. In a boot and shoe crimper having an extensible foot-section, the combination therewith of the adjusting-screw P, sliding stem M, and hinged arm V connected with said screw and the movable foot-section, substantially as described.

4. The sliding clamps S S′, hinged slotted arm V, and pin W with the sliding stem M, substantially as and for the purpose described.

5. The combination, with the sliding clamps S S′, of the guide-frame H hinged as described, the connecting-arm V, hinged link X, and slotted plate I, substantially as described.

137,544.—*Piano and Organ Key.*—CHARLES F. L. GOTTFRIED and JOHN H. SCHUCHT, London, England. Application filed December 17, 1872.

Each key is made in an upper and lower half, having its own separate fulcrum, and said portions are hinged at the front end to equalise the stroke at different points upon the key.

Claim.—In combination with a key composed of the sections *a* and *b*, the screw *c* and auxiliary lever *f*, constructed and operated substantially as and for the purposes set forth.

137,545.—*Wash-Boiler.*—OSCAR F. GLIDDEN, Stoneham, Mass., assignor of one-half his right to B. A. FOWLER, same place. Application filed February 19, 1873.

A wash-boiler constructed with ledges, on which is located the center pipe with outlets raised sufficiently above the natural bottom of the boiler attachment to admit the flow of water through openings, which are closed by a weighted valve to govern the flow of water to the center pipe and from it to the boiler.

Claim.—In a steam-washer, the combination of the weighted valves H H and the false bottom C D D′ with the pipe K, substantially as described, and for the purpose set forth.

137,546.—*Hot-Air Furnace.*—SAMUEL F. GOLD, Englewood, N. J. Application filed August 5, 1872.

Claim.—1. The combination, with the shell of the furnace, and cast therewith and forming part thereof, of the flanges *c c* and the projections *d d*, substantially as hereinbefore set forth.

2. The construction of the heating-chamber in sections adapted to form together a chamber for the products of combustion, and having thereon flanges *c* studded with projections *d*, substantially in the manner hereinbefore described, whereby the capacity of the furnace may be increased or diminished by the addition or removal of internal sections, substantially as hereinbefore set forth.

3. The arrangement of the smoke-pipe or aperture H below the center of the smoke-chamber, in combination with the disk I, substantially as and to the effect hereinbefore set forth.

137,547.—*Carriage-Step.*—CHARLES H. GOULD, Boston, Mass. Application filed January 2, 1873.

A disk of leather or other like material is covered with a shield of India rubber and fastened to the step.

Claim.—The combination of the India-rubber or equivalent elastic shield A with the sheet or disk B of leather-board or equivalent flexible fibrous material, composing an elastic shield for car and carriage steps, substantially as herein specified.

137,548.—*Inkstand.*—SAMUEL HAWSON, Jersey City, N. J., and THOMAS SWEENEY, Brooklyn, N. Y. Application filed April 9, 1872.

Two separate ink-fountains within a single body, the top of which is depressed to form a sponge-cup.

Claim.—As an article of manufacture, the within-described inkstand, consisting of the body A, sponge-receptacle B, partition C, ink-spaces E E, and cups D D with channels *a a*, all formed of one piece of material, substantially as and for the purposes set forth.

137,549.—*Bale-Tie.*—JOHN W. HEDENBERG, Chicago, Ill. Application filed February 19, 1873.

A metallic loop is combined with the strap-iron which passes around the bale, it being provided with a prong for holding the strap in the place when the bale is under pressure.

Claim.—A plate, A, constructed with the raised loop B, notch E, and prong F, in the form described, and combined with a suitable strap, G H, to form a bale-tie, as set forth.

137,550.—*Machine for Raising Oyster-Dredges.*—WILLIAM T. HOWARD, Baltimore, Md. Application filed March 1, 1873.

A binder, with a reversible fall, is arranged upon the dredge-rope, and is connected by suitable cords with the clutch-lever in such a manner that when a reverse motion is imparted to such rope it unclutches the rope-drum and allows it to turn back independent of the crank-shaft.

Claim.—1. In combination with the dredge-rope, the described or equivalent device and transmitting mechanism for releasing the winding-drum, as and for the purpose specified.

2. The hollow binder D through which the dredge-rope is passed, having means of attachment for the bracing and lever-operating cords, and having also a pawl capable of a vibratory and a perpendicular movement, and controlled by springs, the said movements being imparted to the pawl by the passage of the dredge-rope through the binder, substantially as and for the purpose herein specified.

3. The binder D, connected by the bracing-cord *i′* and weighted cord *i* to the windlass-frame, and detaching-lever to the dredge-rope, as the immediate operator of the whole, substantially as herein specified, for the purpose set forth.

137,551.—*Loom-Shuttle Guard.*—CHARLES H. HUDSON, Clinton, Mass. Application filed January 7, 1873.

The guard extends from the upper bar of the reed over the race-beam, and consists of two grooved arms and a rod, the ends of the rod being free to move up and down in the grooves. At the upper part of each groove is a semicircular recess for receiving and supporting the rod, and near the lower end of each groove is another recess to receive the rod and prevent it from ascending when struck by the shuttle.

Claim.—The shuttle guide or guard as composed of the movable or gravitating rod *b*, and the arms *a a*, grooved and provided with notches at the upper ends of the grooves, and also near their lower ends, all substantially as described.

137,552.—*Elevated Arch Railway.*—EDWIN JAMES HULBERT and AIMÉ NICHOLAS NAPOLEON AUBIN, Portland, Conn. Application filed March 25, 1872.

The arch is formed of angle-iron segments, bound and stiffened by girders and braces. The cars are suspended from wheels which run on the elevated rails borne on the shoulders of the upright bars, and are prevented from oscillation by guide-plates.

Claim.—In elevated arch railways, the combination of the segments *a*¹, binding-girders B B, cast-iron stiffeners C C, upright bars E E with shoulders *e*, and angle-iron guides or plates F, all constructed and arranged substantially as and for the purpose set forth.

137,553.—*Piston-Blower.*—CHARLES W. ISBELL, New York, N. Y. Application filed June 20, 1872.

Within the blower-cylinder are arranged two connected pistons, which reciprocate therein and are provided with valves opening inward to receive air between said pistons from the outside, through valves connected with the opposite ends of the cylinder, and to expel the air thus received through a chamber common to both pistons.

Claim.—1. The combination, with the cylinder A and its inlet-valves B B, of the connected pistons C C provided with inlet-valves F F, and the outlet chamber or passage G whereby the connected pistons receive the air in between them from opposite ends of the cylinder and discharge it through an opening common to both pistons, substantially as specified.

2. The combination, with the pistons C C, of the connecting stays and slides D, the guides and bearing-surfaces E, and the cylinder A, essentially as and for the purposes herein set forth.

137,554.—*Metallurgic-Furnace Lining.*—SAMUEL LANSDOWNE, Sharon, Pa., assignor to himself and RICHARD DAVIS, same place. Application filed July 26, 1872.

Claim.—1. A chamber, A, in the neck and stack of the furnace, communicating, by a pipe, A^2, with the chamber *i*, arranged and combined substantially as and for the purposes set forth.

2. A furnace lined on its exterior, as at *m*, and in the fire-chamber with a composition consisting of cement, Kentucky clay, fire-brick dust, and sand, prepared with water, substantially as described.

3. A lining for furnaces, &c., consisting of cement, Kentucky clay, fire-brick dust, and sand, prepared as described.

4. A lining for the insides of furnaces, consisting of Missouri iron ore, Lake Superior iron ore, Port Entry iron ore, limestone, and charcoal cinders, prepared substantially as described.

137,555.—*Well-Curb.*—NOAH H. LUNDLEY, Bridgeport, Conn. Application filed January 22, 1873.

The curb is composed of a plate having three flanges; the upper one is to receive the pump and prevent refuse water entering the well; the inner one is for the platform to stand upon; and the lower one is to prevent the dirt around the entrance to the well from falling into it and to assist in retaining the curb in place.

Claim.—As a new article of manufacture, a well-curb composed of the plate or cap A, with the rings or flanges B C D, substantially as herein shown and described.

137,556.—*Galvanic Battery.*—ROBERT M. LOCKWOOD, New York, N. Y., assignor to WILLIAM H. SAWYER, same place, and FRANK L. POPE, Elizabeth, N. J. Application filed December 6, 1872.

The negative element, consisting of a copper wire arranged in a horizontal flattened spiral, is held within or between the compound solutions, for the purpose of maintaining a separation of the two fluids.

Claim.—1. The method of effecting or maintaining a separation between two dissimilar liquids in a galvanic battery, by means of the influence of an electric current traversing the negative element of said battery, substantially as herein specified.

2. The continuous spiral wire $c\,c^1\,c^2\,c^3$, forming the negative element of a galvanic battery, and placed within the liquid, substantially as and for the purpose herein specified.

137,557.—*Milk-Cooler.*—WILLIAM D. MCDONALD, Randolph, N. Y. Application filed September 2, 1872.

An inner milk-vessel is arranged within an outer water-vessel. The inner one is provided with a double-flanged cover so constructed as to seal the inner vessel. A vertical pipe passes through the cover and communicates with another which extends horizontally within the milk, and it is so constructed as to discharge the water which flows through it into the space formed above by the cover and the upward-projecting flange.

Claim.—1. In combination with an inner and an outer pan, a cover having a flange, as described, so as to seal the inner pan in connection with water in the outer.

2. A cover having water-pipes depending from it within the milk-pan, so as to cool the contents of the latter, as specified.

3. In combination with the vessels A and B, the trough *e* having the tube e^2 and flap e^1, as explained.

137,558.—*Harness-Buckle.*—JAMES MCLEAN, Meadville, Pa. Application filed November 29, 1872.

The tongue of the buckle is supported at each end by a cross-bar.

Claim.—A buckle-frame having cross-bars E M, arranged to operate in combination with the tongue B H, so that the strain on the latter is relieved by the cross-bars in the manner specified.

137,559.—*Liquid-Meter.*—FRANKLIN A. MORLEY, Syracuse, N.Y. Application filed November 4, 1872.

The valve-stems are fixed to opposite ends of a rocking beam pivoted at the middle to a standard; above this swings a cage containing a heavy ball. A lever, fastened to the frame of the cage by a pin and slot, is pivoted at one end to the rocking beam and at the other to a yoke, the rod of which passes loosely through a U-shaped piece on the piston head and terminates in a button. The valves have each two seats, so that the water enters the upper and is discharged from the lower chamber, and vice versa. The whole mechanism is set on a bar so that the parts may be adjusted before the heads of the cylinder are put in place.

Claim —1. The combination and arrangement of valves F G, rods H I, the lever J, and a piston, B, with the cylinder A having ports C c c' D d d' and double valve-seats *f f g g*, all operating substantially as herein described.

2. In combination with the lever J, valves, and piston, the tilting frame L T and connections K N n O, all arranged and operating substantially as herein described.

3. In combination with a casing, A, having removable heads and containing operating mechanism, substantially as herein described, the bar M, employed in the manner and for the purpose set forth.

137,560.—*Scythe-Stone Holder.*—JESSE L. MORRISON and TRISTRAM H. FLETCHER, North Hollis, Me. Application filed February 10, 1873.

The stone is held in position more convenient for use and is strengthened by the frame.

Claim.—The combination of the frame *b*, the handle *c*, and nut *d*, arranged to hold the stone *a*, as shown and described, and to operate as herein set forth.

137,561.—*Chimney-Cowl.*—WILLIAM H. MYERS, Philadelphia, Pa. Application filed January 31, 1873.

The valve is weighted at one end and pivoted near its center between the two raised sides of the chimney. It is easily moved by the wind, and in a calm it stands vertically. The raised sides of the chimney prevent a down draft.

Claim.—The valve B pivoted so as to tilt over by the pressure of the wind upon its upper surface, substantially as herein described, in combination with the raised sides *a'* of the chimney.

137,562.—*Mode of Connecting Cement Water and Gas Pipes.*—G. CLARKE NICHOLS, Binghamton, N. Y. Application filed November 11, 1872.

The thimble is provided with a bead, forming shoulders. One end has a plane taper from the shoulder and is secured to the pipe by punching the metal into a notch in the socket and filling in with cement. The other end is of spherical form to allow the change of direction from a straight line in the connecting-pipe, which is rigidly secured in place by means of a sleeve slipped over the ends of the pipes and the bead and then filled with cement.

Claim.—The coupling A, having the recess *f* and rounded ends so as to allow the pipes to be turned at angles, in combination with the sleeve B, the parts being lined with cement so as to prevent the contact of the water with the metal of the pipes, substantially as shown and described.

137,563.—*Corn-Planter.*—JOHN NITKEY, Minneapolis, Minn. Application filed September 16, 1872.

The planter consists of a foot-piece with two standards and a hollow moving shaft, which receives the corn at the top and conveys it to a flap-valve at the bottom, from whence it is deposited in a point made to receive it, and the grains are covered by the movement of a covering-hook.

Claim.—1. The combination of the sliding hollow shaft B having chute *f'*, pivoted slotted arm E''', projecting pin *c'*, fly-cam F, connecting-rod G, link E'', sliding hopper E, and reciprocating pusher E' with the arm G'' and metal plate *g'*, constructed to operate substantially in the manner and for the purpose described.

2. The combination of the sliding hollow shaft B, cam-block C having projecting points *c* and *c'*, and arm C' with projecting points *c''*, and pivoted at *c'''*, with the cover D, constructed and operating substantially in the manner described.

3. The three-sided cup *a'* with inclined bottom, in combination with a reciprocating hopper and hollow shaft, substantially in the manner described.

137,564.—*Purifying and Separating Fats.*—ALFRED PARAF, New York, N. Y., assignor to the OLEOMARGARINE MANUFACTURING COMPANY. Application February 11, 1873.

Fat is minced and introduced, together with its own weight of water, into a wooden tank, which is heated to 100° or 120° Fahrenheit by a steam-coil. The oleomargarine and stearine separated are allowed to cool and separated from the water; they are then thoroughly worked with two per cent of salt, put in bags and subjected to pressure or centrifugal action in a temperature of 60° Fahrenheit, which separates the oleomargarine from the stearine. The oleomargarine may be worked a second time with salt.

Claim.—The process or processes for the improvements in the manufacture of products from fresh fat, substantially as hereinbefore set forth.

137,565.—*Windmill.*—JOSIAH B. PARK, North Platte, Neb. Application filed March 18, 1873.

The converging rim is, at its smaller end, provided with a spider, by means of which it is hung upon the horizontal shaft within the yoke which supports the shaft, and is in turn supported upon the vertical spindle so that it can turn thereon by the action of the vane. The shaft has a crank to which a pump-rod may be attached. The wings are arranged within the rim and are held in position by rods having bent ends passing through lugs upon the back of the wings. The rods are supported in elongated sockets on the rim, through which they project outward, and carry at their outer ends centrifugal balls. Each rod is encircled by a spiral spring, which draws the rod inward until further movement is prevented by the lugs upon the backs of the wings coming against the straight ends of the rods.

Claim.—1. The combination, with the converging rim and wind-wings, of centrifugal balls and their rods and springs, arranged to hold the wings at a determined obliquity until the wheel attains its maximum speed, after which they will adjust them in the manner and for the purpose specified.

2. The combination of the converging rim A, wind-wings B hinged thereto, ball-rods G, centrifugal balls H, and springs I, arranged and operated substantially as set forth.

3. In combination with the elements enumerated in the second claim, the series of hooks *a'*, substantially as and for the purpose specified.

4. A wind-wheel composed of a converging rim and wind-wings adjustably hinged within it, substantially as and for the purpose specified.

137,566.—*Fire-Proof and Water-Proof Roofing.*—EDWARD R. PERCY, Lawrence, Kans. Application filed January 22, 1873.

A sheathing of the ordinary water-proof material is laid and held in place by a coating of concrete instead of by nails, which, by perforating the covering, cause leakage under expansion and contraction.

Claim.—The method of combining water-proof and fire-proof roofing for buildings without the use of cleats or nails or their equivalents for fastening the water-proof covering to sheathing, substantially as described.

137,567.—*Barrel-Header.*—CHARLES B. PETTENGILL, Hebron, assignor of one-half his right to FREEMAN C. MERRILL, South Paris, Me. Application filed February 24, 1873.

A bent bar fits around the bottom of the barrel. To the ends cords are attached that are secured to the journals of a windlass, the journals moving in two bearings that fit to a press-board. By turning the windlass the barrel-head is forced into place by the press-board.

Claim.—The combination of the bent rod *a*, cords *h h*, windlass *c*, bearings *d d*, press-board *e*, and lever *i*, as and for the purposes herein set forth.

137,568.—*Knitting-Machine.*—COBIN H. PLATT and GEORGE A. STANDERT, Norwalk, Ohio. Application filed March 7, 1873.

Claim.—1. The disk B, having the annular key-ring b^1 and grooves $b\ b^2$, operating in combination with the needle-bar J, substantially as and for the purpose specified.

2. The needle-bearing rings C and D, constructed substantially as described, and seated on the disk B and operating in combination therewith, for the purpose specified.

3. The stitch-retainer L, rocker *l*, spring l^2, arm l^3, and cam A^1, all operating in combination, substantially as and for the purpose specified.

4. The combination of a horizontally-reciprocating needle, I, fixed comb-tooth or stripper E, and stitch-retainer L, substantially as and for the purpose specified.

5. The reversing yarn-carrier K, operated by means of sliding bar k^1, feather f^1, and reversing mechanism, substantially as set forth, and for the purpose specified.

6. The needle I, constructed as described, and provided with the notch i^2 and notch i^1, or its equivalent, for the purpose specified.

137,569.—*Harrow.*—WILLIAM H. PLATT, Dayton, Ohio. Application filed November 9, 1872.

The harrow tooth is made of steel and tapering toward the point. The head is conical and is set obliquely to the sides of the tooth.

Claim.—A tapering harrow-tooth having the square neck and the dome-like or convex head, having its under face oblique to two adjacent sides of said neck, as herein described and shown.

137,570.—*Cotton-Bale Tie.*—WILSON C. RAMSAY, Wadesborough, N. C. Application filed March 3, 1873.

A single strap of hoop-iron provided with a metallic loop having points or teeth on its under side.

Claim.—As an improvement in bale-ties, the loop B having pointed projections *i i* arranged to operate with the band A, bent substantially as and for the purpose specified.

137,571.—*Felly-Plate.*—HENRY SILVESTER, St. Louis, Mo. Application filed September 5, 1872.

The plate does not depend upon the insertion of bolts or screws through the rim, and the band clasping the ends of the fellies prevents their splitting.

Claim.—The felly-plate A, consisting of the plate *a* and the band *a'*, in combination with the tire C, provided with vertical flanges, and the rim of the wheel, substantially as described and shown.

137,572.—*Making Windows Weather-Proof.*—BENJAMIN SMITH, Chicago, Ill. Application filed October 21, 1872.

A strip of rubber is held in place in a shallow recess on the edge of the sash by a piece, D, so that its edges maintain contact with the frame and prevent ingress of air and water. Room is made for the cord by using a bent metallic holding-piece in place of the wooden strip.

Claim.—1. The stile A, provided with the V-shaped groove *b b* and rabbets B B, in combination with the V-shaped rubber C C and strip D, as set forth.

2. The curved plate G and rubber I I passing under the cord

F, and elongated at J S, to meet the rubber C, as and for the purpose specified.

137,573.—*Governor for Steam-Engines.*—BENNET B. SMITH, Nashville, Tenn., assignor of one-half his right to WILLIAM H. MCDONALD, Green Hill, Ala. Application filed January 29, 1872.

A shaft, provided with right and left hand screws, is revolved by a hollow driving-shaft into which it enters and reciprocates. To said shaft the governor-balls are connected by bevel-wheels. The first shaft, which is in constant rotation, is caused to reciprocate by two threaded plates alternately thrown in contact with either of the screws by the action of the governor-balls. To the reciprocating shaft the throttle or cut-off is connected.

Claim.—The combination of the hollow shaft A and shaft C with the right and left hand screws D and E, plates H and I, rods F and G, beam J, and rod T, the bevel-gear wheels K and L, shaft M, arms O O, balls N N, and valve U, all constructed and arranged as and for the purpose set forth.

137,574.—*Steering Apparatus for Vessels.*—HENRY JULIUS SMITH, Boston, Mass., assignor to WILLIAM B. FOWLE, same place. Application filed January 4, 1873.

The valves of a movable-cylinder engine, adapted to be directly connected with the rudder, are operated through the medium of the propeller-shaft, and any convenient means of throwing said valves and shaft into and out of gear.

Claim.—The combination of a propeller-shaft, steering-engine, and suitable means for throwing the valve-connections of the latter into and out of gear, the combination being and operating substantially as described.

137,575.—*Printer's Miter-Machine.*—JOSEPH A. STAKEMBURY, Salem, Ohio. Application filed September 4, 1872.

Claim.—1. The rod R and adjusting-screws *e e e e e e*, when used as and for the purpose herein specified and described.

2. The adjustable table C, constructed in the manner and for the purpose herein described.

3. The clamp L L M, constructed as described and shown, in combination with the recessed arm I of the table C, in the manner and for the purpose specified.

4. The combination and arrangement of the file-carriage B, rod R, stop or guide H, and bevel-edged file G, all constructed and operating in the manner described.

137,576.—*Sugar-Evaporator.*—HOMER C. STEVENS and THEODORE W. STEVENS, Enosburg, Vt. Application filed October 28, 1872.

The feed-coil connecting the reservoirs and pan is placed within the chimney to be heated by the waste products, and is attached to a hinged door which can be opened to clean and repair the pipe.

Claim.—1. The spirally-coiled pipe H, attached to the hinged door G or shutter, which can be easily opened and detached, and closed to connect with the sap-reservoir A, and discharging-spigot A to operate within the chimney or flue of the evaporating-furnace, as herein set forth.

2. In combination with the chimney E having an opening, F, the hinged door or shutter G and coil H, arranged to be easily opened to expose the coil for cleaning, as herein shown and described.

137,577.—*Buggy.*—CALVIN T. STODDARD, Colebrook, N. H. Application filed March 30, 1872.

The springs are connected at their ends by yokes and at their centers by a vertical guide-rod. The axle-box has an inclined projection on its inner end, by which the dust and sand are conveyed into the groove of the yoke, from whence they fall to the ground.

Claim.—1. The combination and arrangement of the springs C D I J, coupling-yokes G G K K, axles B L, and guide-rods H H N N, substantially as and for the purpose herein specified.

2. The inclined projection *p*, yoke-collar *r*, and sand-groove *s*, substantially as and for the purpose herein specified.

137,578.—*Universal Joint.*—JOHN TROXEL, Nankin, Ohio. Application filed March 10, 1873.

Universal joint consisting of a hollow shell in two parts, provided with internal grooves, in which a ball, with projections secured to its surface, has limited movement. Said projections or pivots, provided with friction-rollers to obviate wear and increase ease of motion, correspond to the said grooves, and serve to communicate motion from one shaft to the other.

Claim.—1. The ball *s*, provided with projections and rollers, or their equivalents, substantially as set forth.

2. The internally-grooved shell *a b*, in combination with the ball and its projections, substantially as shown and described.

137,579.—*Tent.*—EPHRAIM M. TURNER, Fort Worth, Tex. Application filed December 5, 1872.

A tent-frame is constructed of two side frames, consisting of ribs bowed at the upper end and pivoted at the lower end to a step-shaped plate, and when the ribs are erected to support the canvas they maintain radial positions to the plate. A picket-pin is riveted to the plate for fastening it to the ground. Short segmental braces are pivoted to the top of the braces on one side, and attachable by hook and staple to those on the other side, forming an arched roof. A beam extends from one end of the tent to the other over the short braces and under the canvas, and the tent-poles, at the upper ends, are hinged to the tie-braces. By detaching the hooks the tie-braces may be turned in upon the side ribs, and the entire frame can then be folded together for convenience of storage or transportation.

Claim.—1. The combination, with a tent-canvas, of the side-pivoted bowed ribs E, with the foot-plates F, segmental pivoted brace-ties G, and the roof-tree C, constructed and arranged substantially as herein described.

2. The roof-tree C, hinged at one end to the segmental tie-brace G, and locked at its other end to the other extreme tie-brace G, to allow it to be separated from the latter and folded over with the side rib to which it is hinged, substantially as herein described.

3. The tent-poles D D' hinged to their respective end tie-braces G to allow them to be folded with the side frames, substantially as herein described.

4. The roof-tree C, arranged within the space between the ends of the extreme side bow-ribs E and supported upon the intermediate segmental brace-ties, substantially as described.

5. The combination, in a tent, of the side bow-ribs E with the foot-plates F and pivoted picket-pins H, substantially as described.

137,580.—*Water-Wheel.*—HORATIO B. WEAVER, Hartford, Conn. Application filed March 7, 1873.

An outward or side discharging wheel receiving the water at the top, with an annular gate upon the outside of the wheel and moving with the wheel. The device for opening and closing the gate consists of a shaft and a rod arranged to rotate with the shaft, but free to move longitudinally, and provided with a pin extending laterally into an oblique slot in the gate-neck. By moving the gate-rod upward the effect of the pin upon the slot is to rotate the gate a short distance upon the wheel, and by moving the gate-rod down again the gate is rotated back again. The upward movement of the gate-rod opens the gate and the downward movement of the rod closes it.

Claim.—The combination of the wheel, the gate arranged to rotate with the wheel, the shaft upon which the wheel is fast, the gate-rod arranged to rotate with the shaft, but free to move longitudinally, and provided with a pin, (one or more,) or its equivalent, extending laterally into an oblique slot in the gate-neck, all constructed, arranged, and designed to operate substantially as and for the purpose set forth.

137,581.—*Sawing-Machine.*—SETH WHEELER, Albany, N. Y. Application filed July 24, 1872.

An internal gear-wheel is provided with two recesses upon opposite sides, into which a crank-pin, inserted in the periphery of a pinion revolving within the wheel, enters, the crank-pin being inserted with its center exactly upon the pitch-line of the pinion. The saw, therefore, makes two complete reciprocations at each revolution of the large wheel.

Claim.—The internal wheel B and pinion D, when arranged, substantially as herein described, for operating reciprocating saws.

137,582.—*Folding Ladder.*—JOSIAH M. WHITE and ANDREW J. KEE, Hannibal, Mo. Application filed December 11, 1872.

A removable top-piece or platform which can be applied to a folding ladder, or removed at pleasure.

Claim.—The movable step *h* and slots *i i*, arranged and adjusted substantially as set forth in specification, and for the purposes therein set forth.

137,583.—*Band Sawing-Machine.*—BAXTER D. WHITNEY, Winchendon, Mass. Application filed January 24, 1873.

A rotating bearing of hardened steel is placed behind the saw-blade, its rotation preventing the wearing of grooves in its surface.

Claim.—A saw-guide composed of the frame A, guides B B, and rotating disk D, or its equivalent, when arranged and operating in the manner and for the purpose herein shown and described.

137,584.—*Trestle-Platform for Unloading from Wagons.*—JOHN K. WILSON, Brimfield, Ill. Application filed March 3, 1873.

A trestle-platform consisting of bottom piece, sides, and brace, which serves to strengthen the platform and also to prevent its going too far into the wagon.

Claim.—The trestle-platform B C C *a b*, made to slide into the end of a wagon for unloading the same, substantially as described.

137,585.—*Manufacturing Sheet-Iron.*—W. DEWEES WOOD, McKeesport, Pa. Application filed March 17, 1873.

Claim.—In the process of finishing sheet-iron, the combination of the following steps: First, coating the sheets separately with a graphite-and-oil coating; second, rolling and annealing; and, third, hammering in packs while cold, substantially as set forth.

137,586.—*Fertilizer.*—JOHN W. YORK, Nolensville, Tenn., assignor of one-half his right to GEORGE W. MORTON, JOSEPH H. MURRAY, and THOMAS B. TAYLOR, same place. Application filed August 3, 1872.

On a pair of running-wheels is a large seed-box having, in a hopper beneath, a revolving cylinder, with pins upon it, working among others on a hinged apron which is adjusted by a worm-wheel. The cylinder revolves by bevel-gearing on the axle-tree, which latter, by a cam, opens and shuts the bottom of the hopper.

Claim.—1. The combination of the cylinder G and teeth H with the segment P and teeth I, shaft J, worm-wheel O and worm N, shaft K, and hand-wheel M, all as operated and arranged, for the purpose above described.

2. The combination of the shaft D with shaft B by means of bevel-gear wheels E and F, the cams U'', the rod V, crank W, shaft S, valve T situated in box S, and spring 9, all as arranged, for the purpose above set forth.

137,587.—*Railroad-Rail Joint.*—THOMAS V. ALLIS, New York, N. Y. Application filed February 21, 1873.

Expansion and contraction are provided for by turning down the middle portion of the bolt to the depth of the screw-thread

grooves, thus enabling the holes to be bored, as is preferable in steel rails, without excess or diversity of size.

Claim.—In a rail or other joint in which the rails or bars are subject to expansion and contraction, the holes for the joint-bolts formed of the same size in the crosswise direction of the rails or bars as the threaded portion of the bolts, and said bolts made as much smaller in the parts which are in said holes as the depth of the grooves of the thread, or thereabout, substantially as specified.

137,588.—*Insect-Trap.*—JOHN W. ANDERSON, Portland, Ind. Application filed October 25, 1872.

Two flanged plates, with the convex sides turned toward each other, are kept a suitable distance apart by studs or partitions. To the upper plate is attached the outside cage or cylinder.

Claim.—1. In combination with the chamber E, the flanges B and C, constructed substantially as and for the purposes set forth.

2. The combination of the bottom plate A, flanges B and C, the cone D, and chamber E, constructed substantially as and for the purposes specified.

137,589.—*Dentist's Flask.*—CLEMON BAILEY, Kingston, N. C., assignor to himself and H. C. BAILEY, same place. Application filed November 25, 1872.

A semi-elliptic spring is arranged upon the top of the flask, and connected by suitable rods with a bar across the bottom in such a manner as to hold the parts of the flask firmly together while in the vulcanizing-furnace.

Claim.—The curved spring C, hook-rods *f f*, and rod *g*, combined with flask, as described, and for the purpose set forth.

137,590.—*Construction of Metallic Casks.*—JAMES I. BARD, New Orleans, La. Application filed September 17, 1872.

The sheet of metal is cut of the proper size, heated, stamped with a die of the shape and size to depress that part which is to enter the end of the shell. The edge is turned down around the shell and secured to it by means of a groove, without solder or rivet.

Claim.—As an improvement in the construction of metallic casks, barrels, or other similar and equivalent vessels, the metallic head B, when constructed and secured to the shells of said vessels, substantially as described, for the purposes set forth.

137,591.—*Steam-Washer.*—CHARLES A. BRADLEY, Monticello, Fla. Application filed December 21, 1872.

A wash-boiler attachment, with downwardly-projecting tubes in triangular form attached to the under side of the covering-plate, is constructed with openings for passage of the water, and covers to protect the openings.

Claim.—The combination of downwardly-projecting tubes E, made V-shaped in their cross-section, with the ingress-opening in the plate A of a steam-washer, substantially as herein shown and described, and for the purpose set forth.

137,592.—*Grapple.*—JOHN BURKHART, Brookville, Ind. Application filed February 8, 1873.

Two adjustable corrugated grappling-hooks so arranged that they can be conveniently shortened or elongated, to suit the sizes of the bodies to which they are applied.

Claim.—The combination of two adjustable grapples, C, each having a row of hooks thereunder, with swiveled clevis A, having pin *b*, substantially as herein shown and described.

137,593.—*Hanger for Shafting.*—WILSON W. CAREY, Lowell, Mass., assignor to himself and GEORGE W. HARRIS, same place. Application filed March 15, 1873.

The cross-head, with its screw, serves to maintain the box upon the saddle and to allow of it working or accommodating itself to the motions of the shaft.

Claim.—1. The hanger, as composed of the cast-metal cap D, cross-head C, and saddle B, and the two wrought-iron screw-bolts E F, with their nuts *f f*, *g g*, and A A, all constructed and arranged substantially as set forth.

2. The box slotted at top, as described, and the tube or educt *i*, arranged in the slots *k* and connected with one or two oil-reservoirs, o, all substantially as explained.

137,594.—*Portable Stove.*—NATHANIEL E. CHASE, Boston, Mass. Application filed July 24, 1872.

The grate is attached to a side partition, and, being movable, can be so arranged as to admit the draft at one side or from the base at the other. The products of combustion do not pass into the oven-space.

Claim.—The portable stove, constructed as described, adapted to be used either with the outer air entering the flue *k*, and making its exit at *f*, as shown in Fig. C; or by reversing the grate and its partition, adapted to be used with the air entering at *f*, and making its exit through the flue *k*, the cylinder *e* having no passages communicating with the oven-chamber *a*, but such chamber extending around the cylinder *e* and being heated from the entire periphery of the same.

137,595.—*Corrugated Metallic Rolling Shutter.*—ALEXANDER CLARK, London, England. Application filed February 4, 1873.

Claim.—1. The application, to corrugated-metal revolving shutters, of one or more strips or lengths of soft and pliant material, disposed in such manner as to act as a cushion between the coils of the shutter, substantially as and for the purpose described.

2. In combination with the grooves in which the shutter works, a lining formed of strips of leather or its equivalent, applied as shown and described.

137,596.—*Invalid-Bedstead.*—CHARLES M. CLINTON and EDWARD J. MORGAN, Ithaca, N. Y. Application filed February 24, 1873.

The jointed thigh and leg planes are also longitudinally divided, and are connected by links to a rock-shaft so that either part can be elevated or depressed. The leg-planes are also connected by links to a cross-rod near the front of the bed-frame, so that when elevated they will remain in a horizontal position. A supplementary double-inclined plane is also used to lengthen the leg-planes. The rock-shaft is combined with a spring-lever and a perforated sector-plate for adjusting the position of the thigh-planes. The thigh and leg planes are arranged on a tilting-frame, which is adjusted by a spring retaining-pin and a perforated sector-plate. The pivoted back-plane is adjusted by means of a curved rack-bar and a spring-catch.

Claim.—1. The rock-shaft C for adjusting the thigh-planes F F', in combination with the spring-lever C^2 and sector-plate L for holding said thigh-planes at any desired adjustment, substantially as described.

2. The rock-shaft C provided with the actuating-lever C^2, arm C^1, and detachable links *c*, in combination with the longitudinally-divided thigh-planes, whereby either or both of said planes may be adjusted, as described.

3. The longitudinally-divided thigh-planes and links A, in combination with the divided leg-planes for adjusting said leg-planes, as described.

4. The double leg-plane J H, in combination with the parallel links or rods *j* and set-screw J' for effecting the extension of the leg-plane, as described.

5. The tilting-frame B, in combination with the sector-plate D or rack and spring retaining-pin for holding the tilting-frame, as described.

6. The adjustable back-plane E, in combination with the pivoted rack E' and latch K' for holding the back-plane, as described.

137,597.—*Fan-Fly Attachment for Cylinder-Presses.*—PATRICK A. COTTER, Boston, Mass. Application filed March 14, 1873.

As the paper emerges from between the friction-rollers and the cylinder, the upper fan blows it down upon the rollers, and it is fed down to the table. When its edge strikes the table the lower fan, which has an intermittent motion, causes the paper to spread out.

Claim.—1. The fan-fly attachment above described, its essential features being the friction-rollers A A A and the two fans B and C, when constructed and operating substantially as described.

2. The combination of the friction-rollers A A A and the fan B, when they act as a substitute for the carrying-tapes of a cylinder-press, in the manner described.

3. The combination of the intermittent fan C and the table E, when the fan acts as a substitute for the fly of a cylinder-press, in the manner described.

137,598.—*Heating-Furnace.*—ELIAS W. CRANE, Roselle, N. J. Application filed September 18, 1872.

A pipe leads from the floor of an apartment to the smoke-flue of a heating-furnace in the apartment below. A branch from such pipe connects with the throat of the ash-pan of the furnace. By means of a damper within the pipe, and another within its branch, the foul air drawn from the room above is conducted, in whole or in part, into either the ash-pit or the smoke-flue of the furnace, as may be desired.

Claim.—In combination with the air-heating furnace A, the ventilating-pipes C F provided with dampers E G, so that the flow of exhaust air may be conducted wholly or partially into the ash-pit B or flue H, as required.

137,599.—*Addressing-Machine.*—FRANCIS A. DARLING, Fayetteville, N. Y. Application filed January 6, 1873.

Upon depressing the treadle the vertical bar moves downward, carrying with it the large wheel, the movable arm, the prismatic block, and the chain having the address-plates, while a segment, turning loosely on its shaft, meshes with the fixed arm, thus causing a pawl on the segment to turn the prismatic block one-quarter around. Upon releasing the treadle a spring restores the parts. The address-plates of metal are sprung into links of the chain.

Claim.—1. The combination of the reciprocating bar B, a spring, *d*, movable arm A, ratchet-and pawl mechanism, the segment F, and treadle C, fixed bar *c*, or other equivalent means of reciprocating the bar B, substantially as specified.

2. In combination with the elements of the first claim, the wheel D, chain G, and block E on arbor *i*, substantially as specified.

3. In combination with the chain G, the printing or address plates *p*, having their ends bent and inserted or sprung into the slots of the links thereof, as specified.

137,600.—*Furniture-Spring.*—WILLIAM T. DOREMUS, New York, N. Y. Application filed March 15, 1873.

The case is made in two parts. Upon the under side of the upper part are formed one or more rigid projections, and centrally across the upper plate extends a rigid bar. Between the bar and the projections rubber springs are interposed, which project beyond the rigid parts. The lower case or part has a recess to receive the projections, bar, and rubber springs, and the two parts are secured together by a bolt. The rubber blocks are surrounded on their open sides by metallic bands to keep them from bulging out.

Claim.—1. An improved spring formed by the combination, with each other, of the case A B, made in two parts oscillating upon each other, the cross-bar D, the rigid blocks or projections C, and rubber blocks E, substantially as herein described.

2. The combination of the open bands F with the parts A B of the case, the cross-bar D, and the rigid blocks or projections C, and rubber blocks E, substantially as herein shown and described.

137,601.—*Machinery for Embossing Spool-Heads.*—LUCIUS H. DWELLEY, South Boston, Mass. Application filed August 3, 1872.

Automatic machine for embossing the heads of spools, whereby the spools, being placed in a suitable receptacle, may be taken therefrom in succession, carried forward to the embossing apparatus, embossed, and discharged from the machine without the aid of manual labor.

Claim.—1. The combination of the hopper H, the arms *m m'*, and their actuating mechanism with the chute n^1, substantially as and for the purpose set forth.

2. The slider *r*, in combination with the table *q* and the centering-mandrels, substantially as and for the purposes set forth.

3. The combination of the chute n^1, pivotal mandrels C D, and embossing-wheel *e*, substantially as set forth.

4. The combination of the chute n^1, table *q*, slider *r*, pivotal mandrels C D, and the embossing-wheel *e*, substantially as described.

5. An organized automatic machine for embossing the heads of spools, consisting of the hopper H, vibrating arms *m m'*, chute n^1, table *q*, slider *r*, pivotal mandrels C D, and the embossing-wheel *e*, arranged and operating together substantially as above set forth.

137,602.—*Folding Ironing-Table.*—WILLIAM EDWARDS, Cleveland, Ohio. Application filed October 2, 1872.

A folding ironing-table so hinged and braced that a part of the leg at one end may be turned down while a shirt or other garment is being slipped on, the table still standing firm.

Claim.—The slotted leg B, slotted brace E, hook-brace F, reach C, folding leg D, and brace G, in combination with the ironing-board A, as shown and described, and for the purpose set forth.

137,603.—*Clock-Escapement.*—CHARLES FASOLDT, Albany, N. Y. Application filed November 4, 1872.

The pendulum receives impulse from the escapement indirectly through a gravity-arm, so that a surplus power may be imparted to the clock without increasing the oscillations of the pendulum. The impulse-wheel is controlled by the pinion of a section-wheel having two or more teeth or pronga, which escape past an anchor whose vibrations are caused by the movement of the pendulum. The number of the teeth or pronga governs the number of pendulum vibrations to each impulse.

Claim.—1. The combination of the escapement-wheel A, section-wheel C, and lever D with each other, when they are all mounted upon separate arbors, as set forth.

2. The gravity-lever G pivoted to an arm of the lever E, to be operated by the escapement-wheel A, substantially as herein shown and described.

3. The lever E provided with the pin *s*, which serves as a support for the lever G in its neutral position, as set forth.

4. The combination of the pivoted gravity-arm G with the vibratory lever E provided with a pin or equivalent stop, *s*, and an arm, *c*, the fork *j*, lever D, section-wheel C, and escape-wheel A, as shown and described, for the purpose specified.

137,604.—*Culinary Boiler.*—SAMUEL S. FITCH, New York, N. Y. Application filed January 27, 1873.

In the shallow chamber which extends horizontally into the vessel from one side, and which has a door on the outside, heated bars of iron are placed to heat the contents of the vessel.

Claim.—The improved manufacture of culinary boiler or vessel A and shallow chamber D, arranged as represented, and with the latter to open through the side of the former, all being as set forth.

137,605.—*Stop Mechanism for Warping-Machines.*—GEORGE S. FOLLENSBEE and THOMAS C. ENTWISTLE, Lewiston, Me. Application filed January 24, 1873.

When a wire drops from a broken warp-thread it comes in the path of a rod on a vibrating arm and stops the arm, thereby causing a sliding and vibrating arm to slide toward and turn a lever, which releases a spring shipper-rod. The sliding arm is vibrated by a bar (reciprocated by a cam) having two arms forming a double incline, between which the end of the sliding bar is held as long as the threads remain unbroken, but on the dropping of a wire the end of the sliding bar runs up one of the inclines, and is thereby forced forward to actuate the shipper-bar.

Claim.—1. The combination, with the lever G and shipper-bar, of the vibrating and sliding bar F and operating-arms *d d'*, or their equivalents.

2. The combination, substantially as described, of the reciprocating bar P and its arms *d d'* having between them a recess, *e*, with the sliding bar F, arm E, and rod A.

137,606.—*Grain-Drier.*—EDWIN S. FORGY, Dayton, Ohio. Application filed February 15, 1873.

The zigzag placed within the casing is made to vibrate by means of the eccentric-rod, which is supported on eccentric-journals in the boxes on the sides of the casing.

Claim.—An apparatus for drying grain and similar material, consisting of the case A, zigzag D, stove B, pipe C, and eccentric-rod F, when the same are arranged to operate as and for the purpose described.

137,607.—*Saw-Set.*—CYRUS E. GRANDY, Stafford Springs, Conn., assignor to himself, ZIBA B. GRANDY, and WILLIAM D. HEALD, same place. Application filed February 21, 1873.

The combination is novel mainly in virtue of the guide, a bar with an overhanging lip, movable and adjustable on the handle, for maintaining connection of the tool with the saw.

Claim.—The hinged and spring-retracted die-bar B D, the cam-lever E, link F, sliding guide H, and gage-screw I, combined and arranged in connection with stock-bar A, as described, to form a saw-set for band-saws.

137,608.—*Horse-Collar.*—WILLIAM GUILFOYLE, New York, N. Y. Application filed March 1, 1873.

The perforations of the covering metallic plate are to allow the under part of the collar to be chambered out, and lifted from the sores and scalds upon the shoulders of the horse by stitching through the leather pad. Suitable trace-fastenings are likewise secured to the plate.

Claim.—1. The metallic perforated shoulder-piece B, with projecting rim *b* and eyes *g*, substantially as described.

2. The trace attachment C, in connection with wire piece *d*, for the placing on of the harness and traces, as set forth.

137,609.—*Adjustable Brace-Coupling.*—CYRUS M. HALL, Yates City, Ill. Application filed March 8, 1873.

Curved braces secured together in the center by a loose ring, and turning upon the end fastening so as to permit the movement of either section independently of the other.

Claim.—The combination of the brace-rods A A bent, as described, to form the bails *a a*, and outwardly-curved ends *b b*, the loose ring B, and the bolt or swivel-joints C C, to form an adjustable brace-coupling, as herein set forth.

137,610.—*Child's Chair.*—JAMES F. HARRIS and EDWARD D. CHILDS, Charlestown, Mass. Application filed February 4, 1873.

The seat is made reversible, and the curved front legs form the rockers when used as a rocking-chair. The foot-board has a pin on each end that slides in angular slot-holes made in the curved front legs.

Claim.—A combined rocking-chair and high chair, constructed with the rockers *a a*, reversible seat *d*, foot-board *i*, pins *k k*, and angular slot-holes *l l*, or their equivalents, and the brace *n*, as and for the purpose set forth.

137,611.—*Wheel-Plow.*—JOAB H. JANES, HARVY TUCKER, and TILGHMAN D. TERRY, Knobnoster, Mo. Application filed February 27, 1873.

Claim.—1. The arrangement of the axle A, beam C with caster-wheel D and seat E, tongue K, and plow-frame G, all substantially as shown and described, and for the purposes herein set forth.

2. The arrangement upon one axle, A, of the plow-frame G and drum or roller L, substantially as and for the purposes herein set forth.

137,612.—*Wash-Boiler.*—PHILIP KRUMSCHEID, Boston, Mass. Application filed March 15, 1873.

A wash-boiler constructed with end pipes or conductors, with perforations at their upper ends and flanges at their lower, with projecting sides, in angular form, which serves to support an adjustable cover, which has a center opening, and is covered on both sides by a cover attached at a sufficient distance to allow a free circulation of water or steam.

Claim.—The side plates or flanges D, and the detachable plate E provided with a lower cap-plate, F, and an upper cap-plate, G, in combination with the flanges C^2 of the tube-plates C, and with the boiler A, substantially as herein shown and described.

137,613.—*"Knock-Down" Chair.*—CHARLES R. LONG, Louisville, Ky., assignor to LONG & BROTHERS, same place. Application filed February 21, 1873.

The back rail is beveled to enter the oblique notches in the back post. The beveled face is also notched in a half-round form to receive the round extension of the seat-stretchers. The seat-frame and back are combined by the joint thus formed.

Claim.—The back rail A with bevel L and half-round notches M, the stretchers C with tenons N, and the posts B with oblique notches P, combined to form a joint in a knock-down chair, as and for the purpose described.

137,614.—*Harvester.*—CHARLES N. MCCANDLISH and JOHN C. NAGLEY, West Rushville, Ohio. Application filed November 30, 1872.

The caster-wheel for supporting the tongue is made adjustable by means of a pivoted link and perforated base.

Claim.—The described means for connecting the tongue A and wheel E, consisting of the yoke-held plate B, the pivoted arm C, the pivoted bars D D, and the pivoted bar F, constructed in all respects substantially as and for the purposes set forth.

137,615.—*Process of Purifying Carbonic-Acid Gas.*—ASA P. METLERT, New Britain, Conn. Application filed November 4, 1872.

The carbonic-acid gas is passed through a weak solution of acetate of lead having the deutoxide of lead in solution.

Claim.—The method of purifying carbonic-acid gas by the use of deutoxide of lead, substantially as described herein.

137,616.—*Last.*—WILLIAM J. B. MILLS, Philadelphia, Pa., assignor to MILLS SHOE-MACHINE AND MANUFACTURING COMPANY, New York, N. Y. Application filed September 7, 1872.

Improvement on patent No. 126,234. The improvement consists of a heel-piece secured to the last, covered in said patent, and a detachable piece at the toe.

Claim.—1. The combination, with the sewing-last D, of a detachable block, A.

2. The combination, with the sewing-last D, of a heel-piece, B,

137,617.—*Car-Coupling.*—DEMCY C. MORRIS, New Sharon, Iowa. Application filed March 1, 1873.

The button is to prevent accidental uncoupling.

Claim.—The bumper-heads A having transverse notches or grooves a^1, and longitudinal notches or grooves a^2 formed in the upper sides of their outer ends, the link B having arms b' formed upon one end, and the buttons C in combination with each other, substantially as herein shown and described.

137,618.—*Sewing-Machine.*—JOHN O'NEIL, New York, N. Y., assignor to himself and R. A. SCHONEMAN, same place. Application filed January 6, 1873.

Makes chain-stitch. The rock-shaft is provided with a hook and with feed-operating cams, and derives its motion through the devices enumerated, operated through the vibrating needle carrying-arm, to which they are connected by the connecting-rod.

Claim.—The arrangement of the bell-crank T, connecting-rod U, slotted block W, slotted arm V, and connecting-link X with the needle-arm and the rock-shaft, for operating the latter in the manner described.

137,619.—*Door and Gate Spring.*—CHARLES N. OWEN, Salem, Ohio. Application filed February 20, 1873.

Upon the end of the fixed bracket, which is attached to the gate, are formed serrations, and above this serrated disk is an intermediate stationary serrated disk for adjusting the tension of the coil spring inclosed within the inverted cup attached to the chair-arm of the door-spring. Thus the spring is entirely inclosed, and, with its adjusting devices, is protected from the weather.

Claim.—The combination of the spring-inclosing cup or case B, chain-arm B', stationary bracket or disk A', and interlocking spurs on the stationary bracket, and intermediate stationary disk C for adjusting the tension of the spring on the chain-arm B', substantially as described.

137,620.—*Draft-Faucet for Soda-Water Apparatus.*—JAMES PATTERSON, Philadelphia, Pa., assignor to CHARLES LIPPINCOTT & Co., same place. Application filed December 2, 1872.

By turning the spindle the flexible diaphragm is first partially relieved, thus permitting a small quantity of soda-water to issue through the central passage, and then wholly relieved through the raising of the nut holding its outer portion by a pin on the spindle, allowing a large body of the water to pass through the chamber and nozzle, the flow through both passages being cut off simultaneously on reverse movement of spindle.

Claim.—1. The combination, with the passages *b* and *d* and chamber *c*, of the elastic diaphragm A and the slotted nut *f*, spindle B and its pin *x*, or their equivalents, whereby the diaphragm, when raised, uncovers the openings successively, but when depressed closes them simultaneously, substantially as and for the purpose set forth.

2. The combination of the said diaphragm and its seat, slotted nut *f*, spindle B and its pin *x*.

137,621.—*Manufacture of Iron and Steel.*—JOHN PEDDER and GEORGE ABEL, Pittsburg, Pa. Application filed March 21, 1873.

Manufacturing iron and steel direct from the ore, by the introduction of carbonaceous gases from one chamber, in which they are generated or evolved under heat, into another chamber, in which are inclosed the ore or metallic oxides, the latter chamber being practically closed against the introduction of any but the carbonaceous gases.

Claim.—The process of reducing metallic oxides by inclosing them, with suitable fluxes, in a case which shall be infusible and incombustible at a reducing heat, and while so inclosed subjecting them, at a reducing temperature, to the action of carbonaceous gases or vapors, or both, which gases or vapors are evolved or generated in a separate case or retort and introduced into the ore-case, substantially as set forth.

2. The combination of cases *a* and *d*, the one containing ore with suitable fluxes, and the other any suitable carbon, and a suitable perforated diaphragm, *b*, for closing the open end of the ore-case, such cases being suitably constructed for admitting, at pleasure, the gases or vapors from the one into the metallic contents of the other, substantially as set forth.

3. In the manufacture of iron and steel, charging the cases of reduced oxides so made into a bath of molten metal in a furnace, retort, or crucible, melting the same with such molten metal, and working up or drawing off the resultant product, substantially as set forth.

137,622.—*Dried-Fruit Loosener.*—CORNELIUS RAGAN, Waterloo, Iowa. Application filed February 8, 1873.

A flat spiral blade having a chisel or wedge-shaped point.

Claim.—As an article of manufacture, a fruit-loosener consisting of a flat spiral blade having a chisel or wedge-shaped point slightly inclined from a plane perpendicular to that of the axis of tool, as and for the purpose described.

137,623.—*Hinge.*—ANDREW RANKIN, Philadelphia, Pa. Application filed February 27, 1873.

Two steel washers are interposed between the eyes of the hinge, and each one is secured by a projecting hook to its respective leaf, so that it can only revolve when the leaf does. There is then no friction of parts on operating the hinge, except upon the two steel washers.

Claim.—The hard-steel rings *c* and *c'* interposed between the two hubs of the hinge and connected one to each half of the hinge, all as and for the purpose herein set forth.

137,624.—*Medical Compound for Liniment.*—WILLIAM E. ROSE, Hornellsville, N. Y. Application filed December 11, 1872.

Oil amber, tincture capsicum, spirits turpentine, laudanum, beef-gall, oil hemlock, oil sassafras, tincture lobelia, oil lemon, alcohol.

Claim.—The combination and specified proportions of the same, as substantially shown, and for the purpose herein described.

137,625.—*Breech-Loading Fire-Arm.*—CHRISTIAN SHARPS, Philadelphia, Pa. Application filed July 14, 1871.

Claim.—1. The curved cam-like projection *q* of the breech-piece, arranged to act upon and lift the hammer to the position of half-cock when the said breech-piece is opened, all substantially as specified.

2. The firing-pin K, so combined with and controlled by a cam-slot, *l*, dog *m*, or equivalent device, that it shall be drawn back by the same into the breech in the act of opening or closing the latter.

137,626.—*Sawing-Machine.*—CHARLES H. SMITH, Faribault, Minn. Application filed February 8, 1873.

The sawing mechanism, together with the engine which drives it, are mounted upon a car which is moved from one wood-pile to another along lines of railway.

Claim.—1. The wood-holding triangles pendent between the saws and preventing the wood from falling or being thrown out, as described.

2. The combination of the chutes T with the saws and the elevator, substantially as specified.

3. The relative arrangement of the wood-rack, endless carrier, saws, and elevator with the truck-frame or movable platforms A, substantially as specified.

137,627.—*Shipping-Can Shield.*—HORATIO M. SMITH, Chicago, Ill. Application filed November 16, 1872.

Claim.—A shipping-can provided with an outer shield, consisting of paper, pasteboard, or tar board, substantially as and for the purposes specified.

137,628.—*Wardrobe-Bedstead.*—JACOB SMITH, Chicago, Ill. Application filed January 30, 1873.

The folding frame is attached to a pivoted rod having an elevating-spring. The mattress is held in place, when the bed is inclosed in the case, by a slat which is hooked to one side of the frame, and engages, by a spring-catch, with the other side of the frame.

Claim.—The combination of the fastening-slat D, constructed as described, with the folding case S A B, rod E, spring F G, cross-slat C, skirting L, fastening N, and bottom I J, as and for the purpose specified.

137,629.—*Wheel for Vehicles.*—ORLANDO D SPALDING, Mankato, Minn. Application filed October 26, 1872.

Claim.—The arrangement, on each side of hub and within shells D, of a series of loose bearing-rollers, F, without journals, in contact with each other, and moving freely with the axle, as and for the purpose set forth.

137,630.—*Machine for Turning and Cutting Wire.*—CHRISTOPHER M. SPENCER, Hartford, Conn. Application filed February 14, 1873.

The wire is fed from a coil into a stationary tube, which has a sleeve sliding over it that closes the split end of the tube onto the wire. A hub, supported in bearings, revolves about the tube and carries a transverse slide with a tool which is fed to and from the wire by a lever and slide-bar running along the hub.

Claim.—1. The combination of hollow stationary chuck D, reciprocating sleeve M, rotating hub or spindle H, provided with carriage B, with slide O, toggles K P, and the tool T.

2. The combination of hollow stationary chuck D, reciprocating sleeve M, and rotating hub or spindle H, provided with carriage B, slide O, and tool T, with mechanism for reciprocating the said tool, substantially as shown and described.

137,631.—*Machine for Turning Heads of Bobbins.*—CHRISTOPHER M. SPENCER, Hartford, Conn. Application filed January 7, 1873.

The rest which slides along the bed has two uprights—one end of the work revolves in one, the other carries a drill or facing-tool, which is moved to and from the work by a cam acting on the rest. A transverse slide in the rest, which carries two tools, one for shaping, the other for cutting, of the work, is moved forward by a cam and back by a spring.

Claim.—1. In combination with the carriage B capable of endwise movement on the bed H, and provided with the rest X and drill P, the transverse-sliding table Q with means for reciprocating the same, and provided with its tools.

2. In combination with subject-matter of first claim, the cams L and T, stop *g*, and shaft D.

3. The combination of slide B provided with the drill P, and transverse slide Q provided with the tools H and K, cams L and T, stop *g*, shaft D, feed-nut *w*, and feed-shaft *b*.

137,632.—*Automatic Draft-Regulator for Stoves and Furnaces.*—ALFRED W. SPRAGUE, Quincy, and JAMES M. OSGOOD, Somerville, Mass.; said OSGOOD assigns to said SPRAGUE. Application filed August 16, 1872.

Claim.—1. A wheel or portion of a wheel chambered in such a manner as to contain a column or mass of mercury or other fluid, or any substance acting as a fluid, and so connected with the damper or valve of a heating apparatus that the expansive force of air or gas, displacing the fluid, may cause the said wheel to turn, thus opening or closing, as the case may be, the said damper or valve.

2. The combination and arrangement of the space *f*, partition *g*, passage A, and hollow axle *e*, substantially as and for the purposes hereinbefore specified.

3. The arrangement of the hollow axle *e* with the arm *l* and weight *m*, as combined with the wheel *c* and its internal arrangement, substantially as and for the purpose above set forth.

137,633.—*Wagon-Brake.*—WILLIAM B. STANLEY, Groveton, N. H. Application filed December 9, 1872.

A novel arrangement of rods and chains to connect the hand-lever with the brake-levers.

Claim.—The rods A A, provided with screw and nut at one end and chain at the other, combined with levers G G and extensible reach, as and for the purpose described.

127,634.—*Fruit-Drier.*—JOHN STEVENSON, Sparta, Ill. Application filed October 19, 1872.

Two separate and communicating chambers, one having a series of superposed open-frame supports for trays, and steam-pipes arranged beneath the open frames, the other chamber having a steam-coil for heating. The trays are moved by traversing cords and hooks.

Claim.—The fruit-drier herein described, consisting of the air-heating chamber A, drying-chamber B, chimney C, steam-pipes F G, superposed open frames D, trays E, and traversing cords and hooks *d*, all constructed and arranged to operate as set forth.

137,635.—*Manufacture of Acid Phosphates.*—HENRI STORCK and FARNHAM MAXWELL LYTE, Asnières, near Paris, France. Application filed February 27, 1873.

In the manufacture of acid phosphates, the residuum (consisting of phosphates of iron and alumina together with some phosphate of calcium) is treated with carbonate of soda to convert the iron, &c., into oxides, and then with caustic soda forming soluble aluminate of soda, the iron remaining insoluble; secondly, the residuum is treated with hydrochloric acid and a salt of lime or barium, concentrated to 44° Baumé, when the acid phosphate crystallizes out.

Claim.—1. The method of treating the residues hereinbefore described, as and for the purpose set forth.

2. The method of producing soluble acid phosphates by attacking earthy phosphates, especially phosphate of calcium, with properly-diluted phosphoric acid, subsequently precipitating the earthy matter by means of alkaline sulphates, (as, for instance, by sulphate of ammonium,) and the extraction of the sulphuric acid contained in the residual liquor by treatment with the phosphate of barium, lead, or strontium, or the carbonates or other suitable salts of those bases, substantially as and for the purposes hereinbefore specified.

137,636.—*Recovering Fatty and Coloring Matter from Waste Wash-Liquors.*—JOHN THOM, Chorley, and JOHN STENHOUSE, Pentonville, London, Great Britain. Application filed February 11, 1873.

The waste soap-liquor is treated with a solution of muriate of lime, and milk of lime added until free lime remains in the mixture. After mixing thoroughly, and allowing to settle, the supernatant liquor is drawn off. The precipitate, containing the fatty and coloring matter from the waste soap-liquor, is then treated with an acid (muriatic) sufficient to decompose the fatty compounds, but not the coloring-matter. The whole is then filtered through flannel, the fatty and other matter left on the filter are heated to melt and agglutinate the colored fatty substance; then cooled and pressed in bags to remove any watery solutions. The substance removed from the bag may be further heated to remove any remaining water, (not exceeding 212° Fahrenheit, so as to decompose the coloring-matter.) The color, (if too much acid has been added in the previous treatment will be supplied with a base,) combined with the fatty matter, (the coloring-matter being insoluble, or nearly so,) may be treated by hydrocarbons to extract the fatty matter, or the same may be separated by heat and pressure.

Claim.—The within-described process of recovering both the coloring and fatty matter from waste wash-liquor—that is to say, first treating the matter so as to decompose the fatty parts, forming a combination of the coloring-matter with a suitable base, and then separating the fat from the coloring-matter by pressure or by the use of a solvent, as set forth.

137,637.—*Molder's Draw-Spike.*—ROBERT A. THOMPSON, Beaver Falls, Pa. Application filed August 31, 1872.

An ordinary molder's draw-spike with a ring-head with one part of the ring detached.

Claim.—A molder's draw-spike having a spring-hammer head, substantially as described, and for the purpose specified.

137,638.—*Press for Printing Fabrics.*—HENRY H. TOWNSEND, Milton Mills, N. H. Application filed January 17, 1873.

The cover is wound upon a roller attached to the side of the press, said roller being provided with a pawl and ratchet. The cloth is passed under the platen and up against the card-roller which holds the cloth while being stretched by turning the first roller backward.

Claim.—The table-cover-printing press provided with the toothed roller E, the winding shaft or roller B, their ratchet-wheels *h n* and retaining-pawls *k p*, and the guide-roller C, or such and the roller D, all arranged substantially as and to operate as and for the purpose specified.

137,639.—*Compositor's Stand.*—FRANCIS VALLEE, Philadelphia, Pa. Application filed February 20, 1872.

The parts made of cast-iron are so constructed as to be readily removed and packed for transportation.

Claim.—1. A stand, consisting of the legs A A, B B, bars D D', G G, and K K, all constructed and arranged substantially as described.

2. The legs composed of T-shaped iron, in combination with runners K of L-shaped iron.

137,640.—*Sewing-Machine.*—GEORGE C. WALTERS, Philadelphia, Pa. Application filed December 12, 1872.

The looper carries a thread which is laid in the hook of the needle, and the stitch formed, is that known as the chain. The feeding-plates, pivoted as described, move together and alternately grasp the material to carry it forward and release it preparatory to moving back over it for a new stitch.

Claim.—1. The feed for sewing-machines consisting of two plates oscillating from a point or points above the work, and between which the work may be clamped and carried independently of the needle, as set forth.

2. The combination of the pivoted bar *p* carrying the clamping-plate F with a sliding rod, J, and guided cross-head r^3 operated by a cam on the driving-shaft.

3. The combination of the bars *p* and *p'* carrying the clamping-plates with the jaws or collar *s*, rod L, and operating arm or lever K.

4. The combination of a recessed work-plate and the clamping-plates F F', oscillating from a point or points above the work-plates, as set forth.

5. The combination of the rotating crank A', vibrating arm *j*, and looper D, operating as described.

137,641.—*Press.*—WARREN E. WARNER, Syracuse, N. Y. Application filed March 1, 1873.

A screw and lever, and nut for actuating it, moving in a stationary guide formed in one piece with the cross-head.

Claim.—1. The combination of the stationary guide with the screw, and the lever and nut for actuating it, and with the cross-head, substantially as specified.

2. The arrangement of the sockets with nuts M and the round heads N of the bars F, whereby the latter roll together and transmit the force directly from one to the other in the last part of the pressing operation, substantially as specified.

137,642.—*Car-Coupling.*—JOHN P. WHIPPLE, Whitewater, Wis. Application filed February 15, 1873.

The pins prevent accidental uncoupling.

Claim.—The combination of the pins J and their locking-pins with the bumpers A and hook B, substantially as herein shown and described.

137,643.—*Musical Instrument.*—JUSTIN WHITNEY and HORACE W. WHITNEY, Boston, Mass. Application filed February 1, 1873.

The double-tongued vibrating hooks are made of wire; they are also supported by a stay attached to the central wire, and may be weighted at the intersection of the supporting-bar. The bridge is constructed in parts to break up its tone C.

Claim.—1. The metal plate or bar A' B' for supporting the hooks, arranged in sections, adapted for one or more hooks, substantially as specified.

2. The double hook and supporting-bar, made of wire and connected together, substantially as and for the purpose described.

3. The middle support G, combined with the middle leg of the double hook and the sounding-board, substantially as specified.

4. The combination of a weight or load, H, with the bow-end of a double hook, substantially as specified.

5. The sounding-board, provided with slot I at the base end, as and for the purpose set forth.

137,644.—*Saw-Sharpening Device.*—CHARLES WILLARD, Bartonsville, Vt. Application filed February 15, 1873.

The emery-block is adjusted to the teeth by the screw. The saw is revolved at full speed, and the crank turned, which moves the emery-block to and fro across the teeth.

Claim.—1. A saw-sharpening device in which an emery-block runs back and forth during the operation, and the saw continually revolving, substantially as herein set forth.

2. The combination of the screw D, nut *b* with flange *d*, and the groove in the under side of the emery-block G for setting said block, substantially as herein set forth.

3. The combination, with the stationary bed-plate A and sliding table C, of the arm or pitman H, wrist-pin *e*, disk *f*, shaft A, and crank J, substantially as and for the purposes herein set forth.

4. The combination of the bed-plate A with arm B and ways *a*, the sliding table C, screw D, nut *b* with flange *d*, emery-block G, crank J, disk *f*, and arm H, all constructed and arranged substantially as and for the purposes herein set forth.

137,645.—*Bee-Hive.*—ROBERT H. WOODSIDE, Coultersville, Ill. Application filed August 30, 1872.

Fixed pins prevent the complete closing of the hinged top of the hive, that the bees may not be crushed; and the moth-entrance is under the inclined woven-wire bee-entrance.

Claim.—1. The combination of the hinged cap D having the flange c^2 with the stud c^3, as described.

2. The combination of the netting entrance-way c^1, the moth-entrance *e* beneath it, and the moth-trap E, as described.

137,646.—*Nut-Lock.*—JOHN MCCALMONT ALLISON, Salina, Pa. Application filed February 15, 1873.

In the face of the outer nut a recess or cavity is formed of sufficient width and depth to receive the entire body of the inner or main nut, thus allowing both nuts to be screwed down to the same base.

Claim.—A nut with a cavity or recess in its face corresponding with the width and depth of a contrarily-threaded nut, so as to be screwed over and down to the same base with the inner nut, substantially as shown and described.

137,647.—*Shutter-Fastening.*—ELLEN D. ANDERSON, Frederick, Md. Application filed November 20, 1872.

A telescopic lock-bolt is formed of a round sliding bar, a sliding tube, and an auxiliary tube, the first two, having each an eye, through which a rod or fastening-pin passes, while the last slides within the main tube, all the parts being so constructed that they form a telescopic joint. There are also two notched brackets, one attached to the inside of each shutter, each consisting of a horizontal plate, a perpendicular notched flange, and a rod, made fast to the shutter at its upper end; the lock-bolt at its shortest length being dropped in an end notch of each bracket securely locks the shutters closed; in like manner, dropped in the other end notches, at its extreme length, it locks the shutters wide open, or at intermediate length, dropped in the proper notches, serves to bow the shutters in desired position.

Claim.—A shutter-fastener, consisting of the two notched brackets D D, and telescopic lock-bolt E, constructed and applicable substantially as described.

137,648.—*Handle of Pocket-Knives.*—JOHN W. AYERS, West Meriden, Conn. Application filed March 12, 1873.

The outer scale of the handle is formed with recesses of dovetail-form, and the inner one has corresponding perforations countersunk upon the inside so that a molten metal poured through the perforations of the inner scale will flow into the recesses in the outer one, and when cool firmly unite the two parts together. The bolster is also united to the scale in the process of casting, a portion of the metal running through a perforation in the inner scale.

Claim.—1. The method herein described of securing the outer or covering scale to cutlery-handles—that is, constructing the covering-scale with a groove or recess of substantially dovetail-form upon the inside, and the metal scale with a corresponding perforation, one or more, so that molten metal poured in to fill the said recess and perforation will unite the covering and metal scale, as set forth.

2. A bolster for the blades of pocket-cutlery, formed upon the scale, the scale perforated beneath the bolster, so that the metal which forms the bolster, flowing through the said perforations, will unite the bolster to the handle.

3. The method herein described of uniting the bolster and covering-scale—that is to say, by forming a recess, *b*, at the bolster end of the scale, so that the metal of the bolster, in the process of casting, flows into the said recess, and secures the scale at the same time of forming the bolster.

137,649.—*Cultivator.*—LORENZO BALDWIN, Stone Mills, N. Y. Application filed November 23, 1872.

A frame provided at the sides with bolts made to receive slotted arms of interchangeable harrow and cultivator, and to render them adjustable; to the forward part of the frame is secured a hoe-blade, fastened to the frame by rigid arms; in the rear of the hoe-blade is a hole into which a hook on the harrow or cultivator is inserted; in front of the hoe-blade is secured a caster-wheel for adjusting the depth of the hoe-blade.

Claim.—The combination of the frame and its blade C and adjustable wheel E, when fitted for the interchangeable plow and harrow, substantially as specified.

137,650.—*Refrigerator and Water-Cooler Combined.*—JAMES S. BATEMAN, Baltimore, Md. Application filed March 5, 1873.

A chest is divided into separate compartments by a conducting partition. One compartment contains a water-cooler supporting a body of ice, which, in melting, passes through a perforated plate into the cooler. Secured in the upper portion of the other compartment is an inclined plate holding a cake of ice. The water from the ice passes through a lateral opening in the partition, and then down the sides of the partition into the water-cooler.

Claim.—The chest A, divided by the conducting-partition B into the chambers C and C', having, in combination the inclined plate *c*, water-cooler D, perforated plate *b*, and tray E, substantially as and for the purpose herein set forth and described.

137,651.—*Steam-Injector.*—SAMUEL BENSON and JAMES BENSON, Centralia, Ill. Application filed February 21, 1873.

The steam and water nozzles are adjustable in such manner that the amount of steam or water admitted is regulated according to the necessities of each case.

Claim.—1. In an injector or steam-pump of the class herein referred to, the combination of an adjustable water-nozzle and one or more adjustable steam-nozzles, for the purposes set forth.

2. The chamber H, having pipes A, K, and C, and nozzle-holder I, in combination with the stationary steam-nozzle E, one or more adjustable steam-nozzles, D, and an adjustable water-nozzle, G, all substantially as and for the purposes herein set forth.

137,652.—*Governor for Steam-Engines, &c.*—JAMES M. BOTTUM, New York, N. Y. Application filed January 17, 1873.

A cylinder with one or more wings attached to its interior, between which freely pass the wings on a rotating shaft, is filled with oil or other liquid, and the shaft is rotated by connection to any part of the engine. Its wings pass through the oil without moving the cylinder, unless the motion is excessive, when the centrifugal motion imparted to the oil acts on the wings of the cylinder which connects with the throttle-valve.

Claim.—The winged shaft I J and winged cylinder C H combined and arranged to operate substantially as herein described, a rotary movement being communicated from one to the other through the medium of liquid contained in said cylinder.

137,653.—*Filter.*—JOSEPH R. BROWN and WILLIAM A. FOSKETT, New Haven, Conn. Application filed March 12, 1873.

A cylindrical chamber having a perforated cylinder arranged therein of less diameter than the main cylinder, and so as to leave a space between the two and the exterior of the inner cylinder, covered by a coat of felt or similar material, through which the water will pass under pressure, and the main cylinder provided with an inlet to admit the water into the space between the two cylinders, and with an outlet from above or within the internal cylinder, so that the water passing through the filtering material will flow freely to the outlet.

Claim.—The herein-described filter, consisting of the cylinder A, the perforated cylinder H, supported within the cylinder A and so as to leave a space between the two, which space is filled, or partially so, with felt or other filtering material, and with a chamber, C, above the cylinder H, a main inlet, D, and outlet F, a cleansing-inlet, S, an outlet, U, provided with cocks to cut off or open the flow, substantially as set forth.

137,654.—*Balanced Valve.*—NELSON H. BUNDY, New York, assignor to himself and ALEXANDER F. WEAVER, Brooklyn, N. Y. Application filed October 16, 1872.

Combines with a slide-valve, sealing-plate, and packing-ring, with a spring with four arms having forked ends that bear upon the packing-rings on the back of the sealing-plate. A set-screw bearing upon the center of the springs adjusts the tension.

Claim.—The combination of the slide-valve B, the sealing-plate E, the packing-ring G, and the spring I having forked ends, and being arranged in relation with said ring G, and a follower, *f*, substantially as and for the purposes herein set forth.

137,655.—*Gas-Works Hydraulic Main.*—PETER T. BURTIS, Chicago, Ill. Application filed November 18, 1872.

Claim.—1. The combination of the separate hydraulic mains A with the gas-pipe C and tar-pipe E, in gas-generators where more than one bench of retorts is used, substantially as specified.

2. The combination of the cut-off valve D and pipe B with the main A and gas-pipe C, so that either bench or main can be thrown out of use without interrupting or interfering with the gas-pipe or the other benches, substantially as described.

3. The expansion-joint F, in combination with the gas or tar pipe for equalizing the expansion or contraction of such pipes as different sections are brought into or thrown out of use, substantially as set forth.

4. The siphon S, in combination with the main A and tar-pipe E, substantially as and for the purposes specified.

137,656.—*Picture-Mounting Machine.*—EDMUND B. CHRISTMAS, Mansfield, Ohio. Application filed January 15, 1873.

The invention provides for mounting photographic pictures automatically, and consists chiefly in the special construction of the parts indicated in the several clauses of claim.

Claim.—1. The tray P provided with the card-receiver R, presser-roller T and gummer-roller V, substantially as shown and described.

2. The guides C provided with the hinged inclines D, in combination with the presser-roller T, substantially as shown and described.

3. The recess *d*, having one end vertical and the other inclined, in combination with the guides C provided with the inclines D, substantially as shown and described.

4. The box W provided with the perforated rack X, presser-foot *b'*, standard *c'*, and gum-roller V, substantially as shown and described.

5. The toothed stripe O provided with the arms *w*, connected by an elastic cord or spring, substantially as shown and described.

6. The platform H, in combination with the stripe O, substantially as shown and described.

7. The platform H, in combination with the sill *k* and stripe O, substantially as shown and described.

8. The platform H, in combination with the rack L, substantially as shown and described.

9. The combination of the card-receiver R and rack L, substantially as shown and described.

10. The combination of the tray P with the rack L, substantially as shown and described.

11. The guides C provided with the inclines D, in combination with the recess *d* and presser-roller T, substantially as shown and described.

12. The guides C provided with the inclines D, in combination with the rack L and presser-roller T, substantially as shown and described.

13. The frame I provided with the screw-bolts I and springs *m*, stripe O, bumper-springs *x*, substantially as shown and described.

14. The frame I, in combination with the rack L and tray P, substantially as shown and described.

15. The frame I, in combination with the rack L, tray P, and gummer-roller V, substantially as shown and described.

137,657.—*Vehicle.*—GEORGE COFFER and WILLIAM M. BERNARD, Dixon, Cal. Application filed August 23, 1872.

Within a metallic drum, having flanges upon the sides of its inner periphery, is arranged a half-cylinder having flanges which move within the flanges of the drum. To this inner half-cylinder is attached the tongue. Power being applied, the tendency is to continually keep the weight of the half-cylinder acting as a moving force.

Claim.—The drum A with its flanges B C, in combination with the bed D, constructed with the flanges *f f* and tongue G, all constructed, arranged, and operated as set forth.

137,658.—*Folding Table.*—STEPHEN V. CORNELL, New Haven, Conn. Application filed February 6, 1873.

A folding table hinged at its center to fold and supported by a center leg with an elastic brace, having an arm or brace resting in a notch at each end and on a spiral spring which forces into its position for the support of the legs at the end of the table.

Claim.—In a folding table, the combination of the divided top A and B hinged together at the center, the legs C C hinged at the extreme ends, the braces D, one end of which is hinged to the table, the other resting in a notch, *f*, in the leg, and a spring between the said brace and table-top, the central leg F hinged to one part of the top, the flexible brace G attached to the leg, and the other part of the top with a locking device, H L, all as specified.

137,659.—*Construction of Breakwaters.*—DAVID CUNNINGHAM, Dundee, Scotland. Application filed March 26, 1873.

Claim.—The employment, in connection with concrete or other blocks for building breakwaters, sea-walls, and other subaqueous or marine works, when the same are constructed with hollow spaces formed therein, substantially as described, of air-tight covers or doors for closing said spaces in order to retain the air therein during the transportation or moving of said blocks to their place of deposit, under the arrangements herein shown and set forth, or any mere modification thereof.

137,660.—*Interfering Attachment to Horseshoes.*—HAMBILTON S. DAVIS, Camden, N. J. Application filed March 14, 1873.

The guard is fastened to the hoof by the same nails that secure the shoe.

Claim.—The elastic pad A having inner and outer flanges *a b*, and adapted to the shoe, as set forth.

137,661.—*Washing-Machine.*—PHYLEMAN A. DOWNER, Baldwin, Iowa. Application filed November 2, 1872.

On a common wash-tub is arranged a transverse bar, which is held by bolts and screws. Attached to the under side of the bar are two rectangular brackets with depressions at the bottom for the journals of a large roller. One journal is extended through a slot in the tub and formed into a crank. Two flat springs are on the transverse bar; at the end of each one depends a rod, and to these are attached links which bear the journals of two smaller and upper rollers.

Claim.—1. In a washing-machine, having the yoked rollers F connected to the vertical rods *g*, the flat springs H arranged on top of the transverse bar B and acting against said rods, substantially as specified.

2. The rectangular frame-like brackets D secured to the under side of the bar B, and constructed with the depressions *b*, in combination with the washing-cylinder E, substantially as specified.

137,662.—*Governor.*—JAMES B. DUFF, New York, N. Y. Application filed November 8, 1872.

Two rotary or centrifugal pistons are arranged on a horizontal shaft in a case with a partition between them, to operate the piston of a governor at right angles to said pistons. The object of the partition is to prevent the currents of liquid created by the rotary pistons from counteracting each other, and thereby the regularity and durability of the governor are increased.

Claim.—1. The combination of two or more rotary, centrifugal, or turbinate pump-pistons with a governor-piston or its equivalent, substantially as described.

2. In combination with a governor-piston or its equivalent, two or more rotary, centrifugal, or turbinate pistons mounted on the same shaft or on separate shafts, with a stationary or movable partition intervening between them, substantially as and for the purpose set forth.

3. The arrangement of one or more rotary, centrifugal, or turbinate pump-pistons working in conjunction with a governor-piston or its equivalent, and mounted on a shaft extending through one of the heads of the pump-cylinder, and carrying a pulley for imparting motion to the pump piston or pistons, substantially as described.

137,663.—*Wash-Boiler.*—CHARLES H. DUNBRACK, Jacksonville, Ill. Application filed March 7, 1873.

A wash-boiler with an interlining or partition to control the steam and water, with a rack suspended from its upper edge, on which the clothing to be washed is hung.

Claim.—The combination of the boiler A and casing B with the rack F, arranged substantially as and for the purpose specified.

137,664.—*Hand Printing-Press.*—WALTER DUNKERLY and WILLIAM H. DUNKERLY, Jr., Woonsocket, R. I. Application filed December 14, 1872.

The platen is hung to the end of a bent lever, from which a spring-rod also extends to carry the ink-roller from the reservoir over the distributing-table and type. Arms connect lever H to a lever, E, from an arm of which a rod connects it to the prime lever.

Claim.—1. The combination, with the platen D having the pivoted arms D', of the lever E having the curved side arms E', connecting-rod F, connecting-arms H, and elbow-lever G, constructed and arranged as specified.

2. The convex ink-plate B having at its upper end the ink-saucer *k*, and attached to the frame A, substantially as specified.

3. The elastic adjustable rod H' and flanged brackets *h* with inking-roller A', in combination with the convex ink-plate B and lever E, substantially as and for the purpose specified.

137,665.—*Shuttle for Sewing-Machines.*—CHARLES W. ELLIS, Bridgeport, Conn. Application filed January 20, 1873.

When the latch is elevated a portion of its lower end serves as a brake and holds the bobbin from turning; then the thread is laid about the latch, as shown, is prevented from falling too low by the spur, is then laid in the hook, then drawn under the tension-plate and into the slotted eye in the case, and then the latch is closed into the shuttle.

Claim.—1. In a sewing-machine shuttle, the swinging latch provided with the stop or brake *e*, in combination with the bobbin.

2. The swinging clamp or latch *e* provided with the hook e^2 spur b^1, and notch *f'*, and arranged with reference to the wall of the shuttle having the slotted eye, substantially as described.

137,666.—*Turbine Water-Wheel.*—WILLIAM H. ELMER, Berlin, Wis. Application filed January 13, 1873.

Gates are made to slide around the wheel, and are held in place and operated by two annular rings, one at the top and the other at the bottom. The rings have notches in their inner circumference at equal distances apart, in which lugs are placed. These gates hang loose in the rings, so that the water will hold them tight against the wheel, and in case an obstruction gets into one of the gates it will open out away from the wheel and allow the others to shut.

Claim.—1. The gates B B pivoted or hinged between and sliding with the rings C C, and working independent of each other upon their pivots, as and for the purpose set forth.

2. The buckets D D, constructed as described, and laid out according to the forms, in the manner and for the purposes herein set forth.

137,667.—*Elevated Way.*—HENRY W. FARLEY, Oswego, Ill. Application filed March 8, 1873.

The cable is supported by transverse and longitudinal plates firmly attached to it. Motion is imparted from the driving-wheel, between which and a set of under rollers the plates are grasped. The axes of the bearing rollers are inclined to furnish requisite space for articles in transit.

Claim.—1. In combination with the cable A the plates B and C, when relatively arranged, substantially as and for the purpose specified.

2. In combination with the carrier as a whole the supporting-rollers D and driving-wheels G, when relatively arranged substantially as and for the purpose shown.

137,668.—*Stirrup.*—JOHN S. FEE, Rockford, Ind. Application filed July 26, 1872.

Claim.—The wood stirrup described, consisting of the stirrup-wood B, rivet D', wooden round E, and metallic caps A binding the ends of the stirrup-wood, and provided with apertures *d'* to receive the ends of the round, substantially as specified.

137,669.—*Machine for Cutting Coal.*—SAMUEL FIRTH, Leeds, England. Application filed June 5, 1872.

The machine, mounted on wheels and moving on rails, has double-headed picks and cutters connected with and operated by the engine. One of the points of the pick cuts from the face of the stratum, and the other increases the depth of the groove.

Claim.—1. The frame *a* made of wrought-iron in the form shown, or substantially in the same form, and forged in one piece, as herein set forth.

2. The double tappet *d* operating in combination with the piston-rod and distributing-valve, substantially as specified, for the purpose set forth.

3. The double tappet *d*, stop *k*, and forked piece *j*, in combination with the distributing-valve, as herein specified, for the purpose set forth.

4. The sockets *n* fitted to slide on the shafts *o*, and in combination with the forks *p*, shaft *q*, lever q^2, link *r*, nut r^1, shaft r^2, and handle r^4, for adjusting and holding the said picks, as herein set forth.

5. In a machine for cutting coal or other minerals, the aforesaid wrought-iron frame *a* mounted on wheels *b* and carrying the above-described operating and adjusting contrivances arranged upon the said frame in combination together, and with the picks or cutting implement shown, substantially as herein set forth.

6. The double-pointed picks m^1 m^2, constructed as described, and arranged relatively to each other, as and for the purpose set forth.

137,670.—*Lamp-Chimney Cleaner.*—ROBERT G. FORSYTH, Oakland, Ill. Application filed February 15, 1873.

A lamp-chimney cleaner, constructed by attaching wires to the end of the handle with a turn at their upper ends, forming springs and reversing the wires, (to point down,) and bent to the shape of the chimney to hold the covering or cloth to be used in the cleaning.

Claim.—The arrangement of the handle A, the springs B, the coils *b*, and the plate *a*, substantially as specified.

137,671.—*Currier's Tool.*—CHARLES A. GARDNER and JOHN A. ENOS, Peabody, Mass. Application filed September 16, 1872.

The stock is provided with a tongued and grooved inclined plane, one part of the stock sliding into the other, holding the blades firmly and being adjusted and held in position by a nut and screw at the end of the stock.

Claim.—A currier's knife in which the parts of the stock are fitted together with a tongued and grooved joint formed as an inclined plane, which is tightened and held in position by a nut and screw at the end of the stock.

137,672.—*Beam and Rollers for Looms.*—GEORGE L. GARSED, Wilmington, Del. Application filed March 12, 1873.

To avoid the effects of the shrinking and warping of the wooden portion of the beam, the heads are attached rigidly to the shaft, and the roll is constructed of several longitudinal sections or strips of wood or in one cylindrical piece, held in position by a

radial shoulder or dog in the recess of each head, into which the ends of the stripe or of the cylinder are inserted. By this means the roll is not held by direct contact with the shaft.

Claim.—The shaft and its heads secured thereto, provided with recesses and with dogs to retain in position the beam or roll formed from one or more pieces, substantially as described.

137,672.—*Spring-Mattress.*—HENRY A. GASTON, San José, Cal. Application filed November 5, 1872.

An upper and lower frame are supported by double-coiled springs, the latter having a clevis termination which is clasped to the under side of the slat. The upper frame is prevented from vibratory motion by guide-rods at each corner.

Claim.—The combination of the upper and lower frames, the double-coiled springs with a clevis-termination, and the guide-rods *c*, constructed as described, and for the purposes set forth.

137,674.—*Lathe-Chuck.*—SAMUEL C. GOODSELL, Westville, Conn. Application filed January 2, 1873.

Claim.—1. The combination, with the chuck-head and the adjusting-nut, of the tail-screw screwing into the adjusting-nut, and the griping-jaws with inclined surfaces working against correspondingly-inclined surfaces in the chuck-head, and mounted on a pin or pins on the tail-screw, under the arrangement and for operation substantially as set forth.

2. In combination with the chuck-head having outwardly-inclined faces, as described, the tail-screw, removable from the front of the chuck-head, as described, and the griping-jaws mounted on said tail-screw, substantially as set forth, so as to be removable from the chuck-head bodily with the tail-screw, and at the same time to be readily adjusted to or detached from said tail-screw, for the purposes stated.

3. The combination, with the chuck-head, of the adjusting-nut, screw-threaded internally to receive the tail-screw, and provided with a shoulder or abutment, against which the chuck-head rests, the two being connected and held together substantially as herein shown and set forth.

137,675.—*Spring-Cot.*—THOMAS JEFFERSON GRIFFIN, Brooklyn, N. Y. Application filed February 21, 1873.

Double lever-springs sustain the slats. The legs are pivoted and held in place by pivoted braces. A wire frame, pivoted to the side rails, holds in position the head-board having grooved ends.

Claim.—1. The springs C C, constructed as herein described, and used in combination with the cross-rods B B and the slats D D, as and for the purpose set forth.

2. The combination of the rails A A, cross-rods B B, slats D D, springs C C, pivoted legs E E, and pivoted braces G G, all constructed substantially as described.

3. The combination of the rails A A, the pivoted frame I of spring metal, and the head-board H provided with a groove at each end, all as shown and described.

137,676.—*Recording Apparatus for Vehicles.*—ALFRED GUEBHARD and ALFRED PIERRE TRONCHON, Paris, France. Application filed July 9, 1872.

A drum or fillet, driven by clock-work, receives a record from a pencil so connected with the body of the vehicle as to give a strong and irregular line when the vehicle is moving, and a light and smooth line when it is at rest. By means of a screw-movement the pencil is carried in oscillating lines to and fro across the drum or fillet.

Claim.—The mode of tracing screw-lines on the paper band by means of the grooves *f f* on the cylinder L, operated through mechanism from the axle of the cylinder G, as shown and described.

137,677.—*Bed-Lounge.*—GEORGE HAETZELL, Philadelphia, Pa. Application filed March 1, 1873.

To the front part of the head-rest is pivoted a swinging arm that forms the head-rest to the hinged part of the sofa when unfolded. To the sofa-back is hinged a cushion or pillow that covers the head-rest of the main part of the sofa.

Claim.—In a bed-lounge, the combination, substantially as described, of a fixed arm, A, a supplementary arm, B, pivoted to the same, and a hinged cushion or pillow, D.

137,678.—*Skate Heel-Plate.*—GEORGE HAVELL, Newark, N. J., assignor to STEVENS, ROBERTS & HAVELL, same place. Application filed February 5, 1873.

The heel-plate has a transverse slot into which the ears of the base of the button fit, and are riveted underneath, outside of the runner-knees.

Claim.—The combination of the lugs *b* to which the button C is attached, with the plate A, said lugs resting in a slot or recess in the plate, and secured in same, as and for the purpose set forth.

137,679.—*Extensible Ladder.*—JOHN C. HEARNE and DUSTON ADAMS, Pleasant Hill, Mo. Application filed March 1, 1873.

A folding extensible ladder. The ropes C limit the extensibility, and rope E is used for raising and lowering.

Claim.—The combination of the two lazy-tongs frames A, cross-bars B, ropes C, rope E, and suspending-hooks or other devices D, the rope E being attached to the lower cross-bar, passing up over the top one, or through an eye, and down again, all substantially as specified.

137,680.—*Apparatus for Cleaning Privies and Sinks.*—ANGIER M. HOUSE, Washington, D. C. Application filed April 1, 1873.

Four or more valves are arranged in a pipe, and to this pipe between the two center valves is attached a force and suction pump, that the elevation of the piston shall cause two of the valves to open, and the lowering of the same shall cause the other two valves to open and close the first.

Claim.—The pipe C provided with valves C^1 C^1 and C^2 C^2, arranged as described, in combination with the pump A, substantially as and for the purpose specified.

137,681.—*Jump-Seat for Wagons.*—CHARLES H. HOWELL, Middletown, Del., assignor of one-half his right to HENRY D. HOWELL, same place. Application filed October 31, 1872.

Claim.—The combination of the box A, seat B with slots *a*, bars C with ears *b d*, bars E, and legs D G, all constructed and arranged substantially as and for the purposes herein set forth.

137,682.—*Sash-Holder.*—ROBERT B. HUGUNIN, New York, N. Y. Application filed April 1, 1873.

As an improvement on former patents, two self-adjusting friction-surfaces on an independent piece, one end of which works in a socket on the outside lever, are combined with a rubber roller and a surface-plate of peculiar construction. Projections are formed, both on the plate and the lever, to prevent the latter from opening out too far, and the lever has a lapping-end fitting on a corresponding projection of the plate. There is also a flat steel spring pressed under the hinge-pin and over a projection on the plate, without other fastening, the whole forming a sash-holder allowing the very freest working of the rubber roller, without liability to bind unduly in any direction.

Claim.—1. The self-adjusting friction-surfaces C and C', being on an independent piece, the upper end working in a socket in lever B, in combination with a roller, lever, and spring, all arranged substantially as and for the purposes specified.

2. The projections I and I' on plate A, and the projections I'' and I''' and M and M' on lever B, combined as and for the purposes specified.

3. The lapping-end K on lever B, in combination with projection L on plate A, for the purposes specified.

4. The combination of spring G, pin F, and holding-projection H on plate A, as and for the purposes specified.

137,683.—*Barrel-Cover.*—GEORGE HUNT, Wawayanda, N. J. Application filed March 14, 1873.

The cover has a rim with a strengthening-cleat on the under side and a handle on the upper side.

Claim.—As a new article of manufacture, the cover A provided with the rim B, the central cleat C secured to its lower side, and the knob D placed upon the upper side and center of said cover and connected with said cleat by means of a screw or rivet, substantially as and for the purpose specified.

137,684.—*Horse-Power.*—HALL M. IRWIN, Davidson College, N. C. Application filed December 27, 1872.

Slats or foot-blocks having a double-diamond shape, so that the upper section of each block assists in supporting the adjoining block when they are traveling between the rollers.

Claim.—The frame A, rollers B B, band C, and slats D D provided with double-diamond-shaped blocks D' D', when the whole is constructed and arranged to form a horse-power, substantially as described.

137,685.—*Reversible Knob-Latch.*—CHARLES S. JENNINGS, Meriden, Conn., assignor to THE PARKER & WHIPPLE COMPANY, same place. Application filed March 21, 1873.

The hub or follower is constructed with a hook upon its rear side, which passes over a segmental flange on a pivoted lever or shoe. The said lever or shoe is provided with a spring, which serves to draw the follower and latch-bolt back into position when the latter is drawn out for the purpose of reversal.

Claim.—The follower A, constructed with the hook *a*, combined with the shoe F, constructed with the segmental flange *f*, and arranged and operating together substantially as specified.

137,686.—*Ruffling or Plaiting Attachment for Sewing-Machines.* ALLEN JOHNSTON, Ottumwa, Iowa. Application filed March 22, 1873.

The number of teeth on the ratchet-wheel equals the number of stitches made in the fabric during one rotation of the wheel, and during one rotation of the wheel but one plait or gather is laid. The depth of this plait may be regulated by means of stops, between which slides a block attached to the pitman.

Claim.—1. In a ruffling or plaiting attachment for sewing-machines, the combination, with a vibrating arm, deriving its movement from the needle arm or bar of the sewing-machine, and ratchet-wheel operated by said arm, substantially as set forth, of a crank pin or arm fixed to said ratchet, and a pitman jointed at one end to said crank pin or arm, and connected at the other end with the reciprocating gathering or plaiting blade, substantially in the manner and for the purposes shown and described.

2. The combination of the pitman deriving its movement from the ratchet-wheel and its crank, as described, with a block or slide arranged and held in or on the reciprocating gatherer proper and between two stops or abutments, the rear one of which is adjustable toward and away from the other, as and for the purposes set forth.

137,687.—*Automatic Fan.*—FREDERICK W. JONES, Orangeburg, S. C. Application filed February 17, 1873.

To the crank-handle of the motor fan-connections, operating reciprocally in opposite directions, are attached.

Claim.—The arrangement of the crank *f*, pitmen D D, levers E E, and brushes G G with the stationary arm H, weight C, and operative mechanism, and the portable box or case A adapted to be hung up in any desired place, as and for the purpose specified.

137,688.—*Belt-Machine.*—JAMES O. JONES, Brooklyn, assignor to himself and ADOLPH STARKE, New York, N. Y. Application filed December 27, 1872.

When a long bolt is to be headed the end of the wedge-bar operating the cutter is removed, and the cutter remains stationary. The stationary die-holder is fastened by a bolt passing through an elongated slot, that admits of its being adjusted for different dies.

Claim.—1. The block *k'*, spring 5, and clamping-screw 4, in combination with the block *k*, wedge-bar *h*, and jaws 6 *i*, substantially as set forth.

2. The removable wedge-block *p* and the slide-bar *q*, in combination with the cutter *c*, shear *n*, and clamping-jaws 5 *i*, constructed and operating substantially as set forth.

137,689.—*Button-Hole Sewing-Machine.*—GUSTAV KALLMEYER, Bremen, Germany. Application filed February 25, 1873.

The devices mentioned in the third clause move a ratchet secured to a grooved cam, which, by a link, is connected with and moves laterally the reciprocating plate in which the needle-bar operates. The check mentioned in the second clause is carried by the link, and is arranged to govern the length of the slot in the link so that it will have more or less play before engaging the stud, and so move the reciprocating plate either to stitch the side of the hole or far enough to finish off the end. The jointed thread-carrier places a third thread under the needle-thread on the surface of the material, and to do so has peculiar movements imparted to it. The material is held in a clamp which spreads the button-hole, and the clamp and material are moved by a feeding device of usual form. The shuttle-thread is held positively to draw the stitch to the edge.

Claim.—1. The combination of a needle moving alternately in parallel vertical planes, substantially as described, and a shuttle moving substantially in a horizontal plane with the thread-guide having the compound motions described, for the purpose of introducing a third thread into the stitch formed by the interlocking of the needle and shuttle threads, substantially in the manner described.

2. The combination of the slotted link *h* and the stud *i*, with the adjustable chock or wedge *k*, for regulating the lateral movement of the shifting-plate and the width of the button-hole stitch, substantially as described.

3. The combination of the stud g^2 on the needle-lever a^2, with the slotted rocking lever g^3, spring-catch g^4, and the adjustable pawl g^1, substantially as described.

4. The combination of the reciprocating plate *f* with the jointed thread-carrying arm N, by means of the stud n^2, whereby the jointed arm n^1 is swung in a plane parallel to the plane of motion of the shifting-plate *f*.

5. The combination of the jointed thread-carrying arm N, by means of the rectangular lever *p* provided with the tripping-toe p^1, with the needle-lever a^2, whereby the jointed arm N, carrying the thread-guide *n*, is swung in a plane at a right angle from the plane of motion of the shifting-plate.

6. The pivoted jointed thread-carrying arm N, operated in one direction by the pin n^2, and in the other by the lever *p*, the needle-bar, the toe p^1, and spring p^2, substantially as described.

7. The thread-presser *e*, constructed as described, and adapted to hold the shuttle-thread against the race-face, for the purpose set forth.

8. The jaws R, provided with the slot r^2 and stud s^2, in combination with the lever *s* with its eccentric hub s^1, whereby the jaws may be laterally distended while holding the fabric, substantially as and for the purpose set forth.

137,690.—*Folding Bedstead.*—JOSEPH L. KILLGORE, Wilmington, Del. Application filed March 27, 1873.

The corner-posts are hinged to the end rails so as to be folded laterally against the same. The side rails are detachable, and all the parts are held by braces.

Claim.—1. The bed-posts A A, hinged to the ends of the end rail B of a bedstead, to be folded laterally against the same, substantially as described.

2. The combination of the end rail B, hinged posts A A, and braces *a a*, with the detachable side rails C and braces *b*, substantially as described.

137,691.—*Lawn-Mower.*—SIDNEY D. KING, Middletown, N. Y. Application filed November 16, 1872.

A reel, driven by bevel-gear from the supporting-roller, has a balance-wheel on each end of its shaft to enable it to clear the reciprocating cutters, which are placed under it.

Claim.—1. The balance-wheels J, in combination with and attached to the reel of a lawn-mower, substantially as specified.

2. The combination of the roller A, spur-wheel E, ratchet F, pawl G, pinion *g*, shaft *g'*, reel I, and cutters M, substantially as specified, and for the purpose set forth.

137,692.—*Obtaining Sulphur, Sulphuric Acid, and Sulphurets of Sodium and Potassium from Gas-Lime, &c.*—JULIUS KIACHER, New York, N. Y. Application filed September 21, 1872.

The gas-lime is heated to 300° Fahrenheit in a closed retort, and steam at 600° Fahrenheit passed over it, evolving sulphureted hydrogen, which passes to a leaden chamber, and is there ignited with atmospheric air to produce sulphurous acid; it is then mixed with nitric-acid vapors, when the reaction produces sulphuric acid. The gas-lime is mixed with clay, loam, or sand, and subjected to heat, when the silica or alumina unites with the lime and with oxygen, forming silicate of lime, &c., and liberating the sulphur. To produce the sulphuret of sodium or potassium the gas-lime, &c., is mixed with caustic soda or potassa, and allowed to stand until the reaction takes place.

Claim.—1. The union of heated refuse or gas-lime or gas-iron with superheated steam, whereby sulphureted hydrogen is evolved, for the purpose of manufacturing sulphuric acid, substantially as set forth.

2. The flowers of sulphur or lac sulphur, produced from gas-lime, combined with loam, sand, or clay, or their equivalents, in the manner and by the means substantially as described.

3. Sulphuret of sodium or of potassium produced from gas-lime by subjecting the same to the action of caustic soda, or other alkali or salt, in the manner substantially as described.

137,693.—*Toy Perambulator.*—JOSEPH S. KRINKS, Bridgeport, Conn., assignor to EDWARD R. IVES and CORNELIUS BLAKESLEE, same place. Application filed February 21, 1873.

To imitate, by an automatic propeller, the movements of the common perambulator.

Claim.—The herein-described perambulator, consisting of the seat or frame A and the figure thereon, having the axle B at the rear and the levers G G' upon opposite sides, the lower ends connected to a crank, the upper ends in the hands of the figure, and combined with clock-work H to cause the said cranks to revolve, all substantially as set forth.

137,694.—*Safety-Guard for Railroads.*—CHARLES LATIMER, St. Joseph, Mich. Application filed May 4, 1871.

A permanent car-replacer combined with the track at bridge-entrances and curves to avert accidents in case of the train leaving the rails.

Claim.—1. The platform B provided with the guides C, in combination with the lifters E and F, substantially as shown and described.

2. The guide-rail D, for the uses and purposes substantially as shown and described.

3. The platform B provided with the guides C, in combination with the lifters E and F and guide-rail D, substantially as shown and described.

137,695.—*Thrashing-Machine.*—DAVID LIPPY and JOHN S. BLYMYER, Mansfield, Ohio. Application filed June 13, 1870.

Cylinder in place of the usual concave, mounted so that it may revolve slowly or be held stationary at will; rear ends of separator-bars supported on friction-rollers, with hinged beaters linked to and operated by said bars to shake up the straw and release the grain therefrom; shaker-bars, having a lateral and longitudinal motion, connect the front bottom board under the thrashing-cylinder with the rear one under the shaker, both operating together; band-cutter composed of sickle-bars arranged at the side of the table.

Claim.—1. The combination, in a thrashing-machine, of the revolving-cylinder B and the loose cylinder C, arranged to operate substantially as described.

2. The cylinder C, arranged loosely in its bearings and disconnected from the operating mechanism, whereby it is permitted to receive an incidental motion from the friction of the straw as it is fed into the machine, and may also be clamped fast and adjusted so as to bring different parts of its periphery into operation, substantially as described.

3. In combination with the revolving cylinder B, the feed-board D having dividing-plates *b*, substantially as and for the purpose specified.

4. The reciprocating rakes C having their rear ends supported on friction-rollers, substantially as described.

5. The beaters *d*, linked to and carried by the rakes C, substantially as described.

6. In combination with rakes *c*, the vibrating bars *e*, constructed, arranged, and operating substantially in the manner and for the purpose specified.

7. The bottom boards F and F', connected and arranged substantially as described, whereby both are operated together and by the same means or driving-power, as set forth.

8. The toothed bar *u*, arranged to vibrate on its axis in a vertical plane, and also horizontally, substantially as herein described.

9. The band-cutter K, consisting of the series of stationary cutters and the series of reciprocating cutters, arranged on the feeding-table and operated from the mechanism of the machine, substantially as described.

137,696.—*Machine for Washing Paper Stock.*—GEORGE L. LOVETT, Fitchburg, Mass. Application filed October 2, 1872.

The buckets are fixed, and revolve with the wire cylinder, raising the unclean water, which is forced into the drum, and emptying it into the fixed hollow shaft, from out of which it flows.

Claim.—The cylinder A, having the opening *a*, in combination with the revolving washer C provided with the buckets B, substantially as shown and described.

137,697.—*Gang Plow.*—GEORGE W. MANUEL, Napa, Cal. Application filed September 20, 1872.

A wheel-plow mounted upon a frame. To the under side of the frame is secured a crank-axle supported by vertical brackets attached to the hounds or beams of the plow-frame. In the ends of the crank-axle are made holes, through which the axle supporting the driving-wheels is passed. The land-side wheel is provided with a crank-arm, through the end of which the axle passes, and is secured by a set-screw. On the land-side a lever is set in notches of a curved rack, and is adjusted to correspond to the lever on the opposite side.

Claim.—In a gang-plow, of substantially the described construction, the lever *m*, adapted to slide in notches of its rack, in combination with the lever *m'*, adapted to be moved forward and backward, and the connecting-parts, arranged as described, for the purpose set forth.

137,698.—*Apparatus and Process for Rendering Lard.*—WILLIAM C. MARSHALL, New York, N. Y. Application filed January 21, 1873.

The raw lard is first cooked and then passed through suitable

cutters or crushers into a tank, where the process of rendering is completed.

Claim.—The within-described process for rendering lard by first cooking the raw lard, then passing it through a crushing or cutting apparatus into the rendering-tank, where the same is again cooked, substantially as set forth.

137,699.—*Apparatus for Treating and Drying Animal Matter.*—WILLIAM C. MARSHALL, New York, N. Y. Application filed January 21, 1873.

The scraps of lard are exposed to the action of heat by being spread upon the surface of steam-coils arranged side by side in a close chamber.

Claim.—1. The within-described process of treating scrap of lard obtained from lard-presses by exposing the same to the heat of steam-coils arranged in a closed chamber, substantially in the manner herein set forth.

2. The arrangement of a series of steam-coils, B, at suitable distances apart, in a closed chamber, A, substantially in the manner and for the purpose herein shown and described.

137,700.—*Corn-Planter.*—ABDIEL C. MARTIN, Waddam's Centre, Ill. Application filed September 28, 1872.

A rectangular frame is supported at its rear end by a pair of wheels having a crank-axle, which can be clutched to the wheels, and thus be caused to rotate. The forward end of the frame is supported by runner-openers, upon which are mounted the seed-boxes. A slide containing an angular slot is placed between them, and is moved back and forth by the crank axle-tree and connecting-rod, thus intermittingly working the seed-slide.

Claim.—The dropping-slide I, in combination with the driving-slide E provided with the angular groove G and driven by a pitman, D, attached to the crank-shaft C, substantially as shown and described.

137,701.—*Rail Fence.*—JOHN W. MATHEWS, Kilbourn, Ohio. Application filed March 29, 1873.

The rails, at their ends, are halved into each other and notched to press horizontally against the halved post, and are thus held in line. The halved posts are held by outside braces, all four secured to the same base board. A third section of the post provides supports for removable bars. A cross-piece affords support to each rail, the upper cross-piece resting upon the leveled tops of the braces.

Claim.—In combination with the sill A, standards B B, braces C C, cap D, and cross-bar E, the rails G G', when the latter are notched to receive the standards and each other, the whole adapted for straight fence, corners, side-hill fence, and bars, substantially as and for the purpose specified.

137,702.—*Soda-Water Apparatus.*—JOHN MATTHEWS, New York, N. Y. Application filed March 21, 1873.

A rubber or soft-metal packing in a recess in the flange of a stop-cock, working against the lip on the bung of a soda-water fountain so as to form a perfect joint between the cock and the fountain. Also, a tapering tube formed of rubber or other elastic substance, with rings or collars in each end, either with or without weights to cause it to lie on the bottom of the fountain.

Claim.—1. The combination of a soft metallic or other packing, *x x*, in a recess in the flange of the stop-cock working against the lip *z z* on the bung of a soda-water fountain, as herein specified, so as to form a perfect joint between the cock and the fountain.

2. A tapering tube, B, formed of rubber or other elastic substance, with rings or collars in each end, either with or without weights, formed as herein specified, and for the purpose named.

3. The devices for securing the pipe or tube B to the cock A consisting of threads on the exterior of the tube and the interior of the projection of the cock, in combination with the lip *c* and the collar or ring *c*, so as to form a joint between the cock and the pipe, as and for the purpose herein specified.

137,703.—*Cultivator.*—JAMES R. MCDONALD, Nevada, Iowa. Application filed September 14, 1872.

A crank-axle for regulating the depth of the plows adjustably connected at middle portion with a slotted tongue.

Claim.—In a cultivator, the combination, with the adjustable pole, the plow-beams, and the pivoted brace-rod, of the adjustable axle bent upward at *a* to connect with the pole, and relatively downward and outward at A to receive the wheels, substantially as specified.

137,704.—*Gas-Retort Closing.*—GEORGE A. MCILHENNEY, Washington, D. C. Application filed February 20, 1873.

Lids and covers for closing retorts without the use of luting.

Claim.—1. A lid for gas-retorts in the form of a spherical segment, arranged to fit within the mouth of the retort in the manner shown and described.

2. In combination with a circular lid, A, a mouth-piece, B, having its front made of a circular form to receive the lid, and its back made of an irregular form to fit the retort.

137,705.—*Harvester-Cutter.*—WILLIAM MCKEEVAR, Staunton, Va. Application filed February 14, 1873.

V-shaped cutter-sections have their shanks cut away at each edge and bent around the rear edge to the under side of a flattened cylinder-cutter bar, to which they are locked by flattened rings slipped on the bar alternately with the cutter-sections, the shoulders of which abut against the front edges of said rings.

Claim.—1. A cutter-blade constructed with a bent shank, *b'*, and the side wings *b b*, as described, to enable it to be locked by sliding up spacers behind said wings, and to allow each knife to be removed without taking off any of the others.

2. The combination of cutter-bar A *a* and spacers C with the cutter-blades B *b b'*, as described, so that the cutters may be reversed to work in a right or left handed machine.

3. The combination, with cutter-bar A *a*, spacer C, and cutters B *b b'*, of the screw E working through a head, D, as described, to lock the cutters, in the manner specified.

137,706.—*Machine for Grinding Saws.*—DAVID M. MEFFORD, Norwalk, Ohio. Application filed March 21, 1873.

Claim.—In a machine for grinding long saws, the rest-gage F with its single set-screw C, when said gage is constructed of a width to bear only on a limited portion of the saw widthwise, and located directly over the center of the grinding-wheel B, which revolves in an opposite direction to the feed, as shown and described.

137,707.—*Stalk-Cutter.*—SAMUEL B. MILLER, Stanwood, Iowa. Application filed February 7, 1873.

The cutting-roller is hung in slotted pendent bearings, and so connected to a rock-shaft that it can be raised from the ground at pleasure by means of a lever extending from the rock-shaft, or pressed firmly upon the earth by means of a weighted lever projecting from the opposite side of the rock-shaft.

Claim.—1. The bar *d*, having lever A and arm *e* provided with rod *g*, in combination with cutting device, substantially as shown and described.

2. The combination of the lever *j*, weight *l*, bar *d*, arm *e*, rod *g*, and cutters, when all are arranged to operate substantially as shown and described.

137,708.—*Seeding-Machine.*—SAMUEL B. MILLER, Stanwood, Iowa. Application filed August 12, 1872.

A rectangular frame supported on wheels has a seed-box mounted upon the forward end, with graduated openings and seed-distributer in the bottom of the box. Drag-bars are pivoted beneath the frame, the forward ends of which extend beneath the seed-box, the rear ends carrying the cultivator or covering-teeth.

Claim.—1. The combination, with the frame A A A A, of the seed-box B, levers *g g*, bars *a a'*, vertical guide-braces F, and fastenings *r'*, constructed and operated substantially as set forth.

2. The semicircular shield *q*, in combination with the S-shaped shaft G, substantially as shown and described.

3. The feed-box B provided with adjustable plates *n* and *o* and semicircular deflector *q*, in combination with S-shaped shaft G, substantially as shown and described.

137,709.—*Spike-Machine.*—THOMAS O'CONNOR, St. Louis, Mo., assignor to ST. LOUIS RAIL-FASTENING COMPANY, same place. Application filed December 11, 1872.

The pivot-pin has a tapered shank fitting in a similar hole in the slide, and held in place by a nut screwed on the lower end of the pin. The upper portion of the pin, forming the pivot of the nipper-arm, is cylindrical.

Claim.—1. The pin E, having cylindrical body *e*, tapering shank e^1, nuts e^2 e^3, in combination with the carriages B D and nipper-arms C, as and for the purpose set forth.

2. The pin E, nut e^3, and spring E', in combination with the nipper-arm C, as and for the purpose set forth.

137,710.—*Nail-Plate Feeder.*—SAMUEL K. PADEN, Pulaski, Pa., assignor to himself and R. V. PIERCE, Buffalo, N. Y. Application filed January 13, 1873.

The plate is fed from the hopper by stubs on two gear-wheels, which strike it at the rear end as they come round. This advances it between frictional intermittingly-rotating disks, which complete the feeding. These gears and disks are rotated by a double-pawl mechanism, which is situated upon and derives its motion from the transversely-vibrating table that supports the hopper. The pawl mechanism can be adjusted to present the plate at any angle desired to the cutters.

Claim.—1. The horizontal gripers E E, arranged on a horizontal vibrator, B B^1, and biting upon the edges of nail-plate, as and for the purpose set forth.

2. A pair of horizontal gripers, E E, arranged upon shafts held together by a single spring, F, as and for the purpose set forth.

3. A hopper, C, closed on all sides, but open on bottom and top, combined on the rear end with rotary studs *l* on wheels L, and on the front with gripers E E, as described, so that the studs *l* start the plate while the gripers then draw it out of hopper.

4. The elastic arm G, having shaft G^1 journaled in uprights G^2 G^2, and the end bearing *g* provided with forwardly-projecting teeth, as and for the purpose described.

5. The flat spring H, applied transversely of the presser G and held at each end by a screw, A, as described, to allow said presser to rise itself and raise the spring between the screws.

6. The combination, with friction-disks E E, of the connected wheels I I and the ratchet-wheels I' I', having detents, as and for the purpose specified.

7. The vibratory double hook-bar J, having a hook, *j'*, at each end, combined with the ratchet-wheels I' I', as and for the purpose described.

8. The combination, with the double hook-bar J *j j*, of the levers K K, fulcrumed in vibrator B B^1 and pivoted in front on each side of the middle of said bar J, as and for the purpose set forth.

9. The levers K K made adjustable on bars *k k* and in upright B^2 toward each other, as described, to regulate the taper of nail.

137,711.—*Artificial Leg.*—B. FRANK PALMER, Philadelphia, Pa. Application filed March 14, 1873.

The cord which controls the toes is doubled, and the toe-piece strengthened by wires passing through it. Projections are formed on the sole under the heel and base of the toes, and cushioned with rubber. The ankle-joint is made of a curved or horseshoe form. The cords representing the heel-tendons are made of silk covered with chamois-skin. The wood composing the body of the leg is wound with thread soaked in shellac and then covered with enamel. The upper end of the leg is wound (to strengthen it) with small wire, which is then turned down smooth. A cap or socket, in which the end of the stump rests, is placed with its upper bearing-edges on an elastic cushion above the upper rim of the leg.

Claim.—1. The double toe-cord L, running in the pulley P, and attached at the rear and back of the leg, as described and shown.

2. The toe-piece C, strengthened as described, and forming a close joint with the foot, as shown.

3. The protuberances M N on the bottom of the foot, as and for the purpose described.

4. In combination with the protuberances M N, the elastic cushion *e e*, formed of rubber tubing, and arranged substantially as and for the purpose stated.

5. The ankle-joint O, made of a curved or horseshoe form, as represented, and placed for the bottom of the foot, with its ends projecting upward to receive the ankle-bolt, all as and for the purpose described.

6. The heel-tendon K, made of strands of silk covered with leather, as described.

7. The supplemental or auxiliary tendons J J, arranged, attached, and operating as set forth.

8. The covering of thread and gum shellac, for the purpose set forth.

9. The stump-socket E, made of leather, molded to conform to the stump, and resting by a shoulder on an elastic cushion about the upper rim of the leg, and fitting snugly, but so as to be easily withdrawn, in a recess of corresponding shape in the top of the leg, all constructed and arranged substantially as set forth.

10. The bowed joint G, constructed, arranged, and operating as described.

11. The confining band or hoop I, formed of wire wound tightly around the leg and turned off on the surface, as and for the purpose specified.

137,712.—*Recovering Tin from Waste Tin-Scrap.*—HENRY PANTON, New York, N. Y. Application filed March 31, 1873.

The scrap cut into fine chips is placed into a revolving cylinder so that mercury is constantly showered over it.

Claim.—1. The process herein described of utilizing waste tin-plate scraps by first reducing them to small chips by the means described; secondly, treating them with mercury in the manner explained; and, thirdly, converting the chips of iron, after such treatment, into steel, in the manner set forth.

2. The apparatus described for treating tin-scrap, consisting of the revolving vessel *a*, provided with the perforated diaphragms A and A' and side pipe *b*, so as to return the mercury and distribute it over the scraps, as described.

137,713.—*Manufacture of Gas.*—ROBERT H. PATTERSON, Hammersmith, England. Application filed March 26, 1873.

Alkaline sulphides, or sulphur finely divided and mixed with a substance which will permit the gas to pass freely, is used in the purifiers, especially in the first of the series. The first vessel is termed the "decarbonating-vessel;" the succeeding contain the alkali to be converted into sulphide. As soon as the gas passing from the "decarbonating-vessel" shows the presence of carbonic-acid gas the vessel is recharged; when the gas issuing from the vessels containing the alkali to be sulphureted shows the presence of sulphureted hydrogen the process of producing the sulphides is complete.

Claim.—1. The application and use, substantially as herein described, of alkaline sulphides—namely, sulphides of calcium, sulphides of sodium, sulphides of potassium, sulphides of ammonium, and also gas-liquor more highly sulphureted by the process hereinbefore described, employed in separate purifying-vessels—for the purpose of purifying coal-gas from sulphur in other forms than that of sulphureted hydrogen.

2. The process herein described for production alkaline sulphides from lime in purifiers, or a solution of soda, lime, potash, ammonia, or gas-liquor in washers or scrubbers, in connection with the purification of gas, to wit, by eliminating the carbonic acid in the first of the series of said vessels and the sulphur in its several forms in the succeeding vessels, whereby the lime or other alkaline substances in any number of said succeeding vessels can be converted into sulphides of said alkaline substances, and thereafter maintained in the form of sulphides as long as may be desired.

3. The method or system of employing a series of alkaline washers or scrubbers—namely, vessels containing gas-liquor or a solution of soda, of lime, of potash, or of ammonia, or of any or all of these substances in conjunction, in the manner hereinbefore described, whereby coal-gas is purified from carbonic acid in the first vessel or vessels of the series, and the sulphur existing in the gas in all forms is eliminated in the subsequent vessels of the series.

4. The employment of sulphur in a state of fine division in conjunction with a substance or substances suitable to form a porous material through which the gas may pass freely, or in combination with lime, or with potash, or with soda, or with lime, potash, and soda together, in solution or otherwise, in order to effect the purification of coal-gas from sulphur existing therein in other forms than that of sulphureted hydrogen, or of any or all of these substances in conjunction, substantially as described.

137,714.—*Portable Window-Platform.*—GEORGE H. PEABODY, Brooklyn, N. Y. Application filed December 24, 1872.

Claim.—A portable seat with connections C and D, buckle E, or other means of adjustment, and bar F, substantially as herein set forth.

137,715.—*Cotton-Chopper.*—WHITMAN PRICE, Mount Olive, N. C. Application filed October 28, 1872.

Claim.—1. In combination with shaft *l* the flanges *z* and chopping-hoes *c*, the flanges being provided with recesses for the reception of the enlarged end of the stems or arms of the hoes, in the manner shown and described, and for the purpose set forth.

2. The shovel-plow *v*, spring-shoes *w*, and arms *y*, in combination with the serrated bar *x* and key *y*, substantially as and for the purpose specified.

3. The shaft *l* and rods *r r'*, in combination with the perforated draw-bar *s* and tongue *t*, substantially as and for the purpose set forth.

137,716.—*Plow.*—WHITMAN PRICE, Mount Olive, N. C. Application filed September 25, 1872.

The land-side is slotted and receives between its double walls the wooden standard and handles, all being securely bolted together. The frame thus constituted receives interchangeably various shares and cutters.

Claim.—The plow provided with the wooden standard, and having its various parts constructed and arranged in combination therewith, as herein shown and described.

137,717.—*Pipe-Joint.*—TREAT T. PROSSER and GEORGE C. MORGAN, Chicago, Ill. Application filed February 24, 1873.

The wooden casing is made in two or more sections, and is provided internally with grooves exactly fitting the globular ends of the pipes. The casing is held in place by metallic rings tightly driven on.

Claim.—The pipes A, having globular ends *a*, in combination with the wood case B held in place by rings *b*, substantially as and for the purposes specified.

137,718.—*Flexible Supports for Mattresses, Seats, &c.*—COLLIN PULLINGER, Philadelphia, Pa. Application filed March 12, 1873.

Two fabrics are faced and seamed so as to form pockets. Into these pockets slats are inserted, and the whole complete forms a flexible covering for seats, mattresses, &c.

Claim.—As an article of manufacture, a flexible mattress support or seat for cars, chairs, &c., formed of two face-fabrics, A B, seamed at *b*, and provided with intermediate slats C, as described.

137,719.—*Car-Coupling.*—AUGUSTUS PURSELL, Williamsport, Pa. Application filed July 14, 1871.

Wedge-shaped plates journaled in the sides of the mouth of the draw-head for holding the link horizontally and at the desired height; also another wedge-shaped plate supported at its thick or rear end by or upon the upper division-plate, and at the front end upon inclined shoulders in the side walls of the mouth. When the pin is raised and the link withdrawn the rear end of the upper plate falls until it rests upon a ledge in the rear of the mouth of the draw-head, which so changes the position of the hole in the plate that the pin cannot pass through. Upon the entrance of the link the rear end of the plate is raised and the hole brought under the pin so that it falls through, and the coupling is thereby effected.

Claim.—1. In combination with the draw-head of a car-coupling, one or more gravitating and self-adjusting plates hung horizontally upon journals in the mouth of the draw-head, but capable of vertical motion, and constructed and arranged substantially as described, whereby a large preponderance of the weight is thrown in rear of the journals and the front of the mouth divided into two or more spaces, in the manner and for the purposes set forth.

2. The gravitating plate G, arranged in an inclined position, on supports for the front and rear ends, in the mouth of the draw-head, and operating in the manner and for the purpose set forth.

3. The combination of the horizontal gravitating division-plates and the inclined gravitating plate G, all arranged in the mouth of the draw-head in relation to one another, substantially in the manner set forth.

137,720.—*Tool for Capping Cartridges.*—JOSEPH L. RAUB, Meriden, Conn., assignor to CHARLES PARKER, same place. Application filed March 7, 1873.

Claim.—A pair of levers or handles, A B, pivoted together, one of the jaws constructed to take hold beneath the head and the other to bear upon the center over the cavity, so that by drawing the two handles together the primer will be forced into its seat in the head of the cartridge-shell, substantially as set forth.

137,721.—*Broom.*—FRANCIS REESE, Calera, Ala. Application filed March 17, 1873.

A broom constructed with one side of sufficient width of frame to receive the straw or corn, and its upper side covered with a projecting piece by which the material is held in place, and serves to attach an upright handle. The parts held together by screws, by which the corn, &c., may be removed and renewed.

Claim.—The combination of the plates A F, the cap piece B, and the binding-screws G G' with the sweeping portion of a broom, substantially as and for the purposes shown and described.

137,722.—*Blacking-Case.*—GEORGE H. RICE, Norwalk, Conn. Application filed October 3, 1872.

A case standing on legs has a hinged lid. Within the case, extending from end to end, near the top, is a foot-rest having slots for the edges of the soles of the boot to rest in when being blacked, and a hinged dirt-guard is in one end of the case. Attached to the bottom is a slide with a recess for holding a box of blacking.

Claim.—The foot-rest D provided with slots *b c*, in combination with the case A, dirt-guard E, and blacking-holder F, the whole constructed and arranged substantially in the manner herein shown and described.

137,723.—*Wood Fence.*—WILLIAM RILEY, Madison county, Miss. Application filed December 30, 1872.

The ends of the rails lap between two uprights, which up-

rights are held in their relative positions by battens below and above, inclined lateral rails or braces resting on the earth and pivoted above the fence, where a top rail presses them upon the fence in their centers and outward at their bases.

Claim.—The posts B B, battens *c c*, rails C C, diagonal brace-rods D D, and horizontal cross-tie rail E E, so combined and arranged as to form a fence without bed-plates, anchor-blocks, or any other equivalent device.

137,724.—*Corset.*—MARY RUSSELL, Union Bridge, Md. Application filed January 22, 1873.

The upper edge of the elastic gore at the breast is drawn down and hooked to its lower point.

Claim.—In a corset, the elastic breast-parts B B, in combination with the fastening devices *b* and *b'*, or their equivalents, as herein set forth.

137,725.—*Stage-Machinery.*—JAMES SCHÖNBERG, New York, N. Y. Application filed October 31, 1872.

A ready mode of scene-shifting by partially automatic apparatus.

Claim.—1. The rising and-falling pin *b* and lifter *c*, in combination with a scene-frame, constructed and operating substantially in the manner herein shown and described.

2. The arrangement of an eccentric foot on the scene-frame, substantially as and for the purpose set forth.

3. The post E, fitting in a corresponding socket in a carriage moving on guide-ways in the floor-timbers of the stage, said post being provided with pins *l o* to engage with the scene-frame, substantially in the manner described.

4. The sleeve *m* fitted on the post E and carrying a pin, *o*, to engage with a socket-piece, *q*, on the scene-frame, substantially in the manner set forth.

137,726.—*Bath-Tub Plug-Socket.*—ROBERT C SCHMIDZOUR, Brooklyn, N. Y. Application filed March 10, 1873.

A socket with a projecting, rounded, and corrugated rim or flange at its upper end is combined with the lining of a bath-tub, which is depressed into an annular groove or recess in the wooden casing of the tub. There is also an open tubular projection on the elbow-pipe, which is coupled to the lower end of said plug, and it serves to receive the lower end of the overflow-pipe and to simplify the connection of such pipe with the main discharge.

Claim.—1. The plug-socket valve C, provided with a rounded corrugated flange, *a*, and combined with the recessed casing A and depressed lining B, and with the packing introduced between the flange and the lining, substantially as described.

2. The elbow discharge-pipe E of the bath-tub, provided with a tubular projection, *d*, and aperture for the reception of the overflow-pipe F, substantially as described.

137,727.—*Hot-Air Furnace.*—MAURICE D. SEWARD, Normal, Ill. Application filed July 23, 1872.

Claim.—1. The above-described construction and arrangement of furnace, having the two long and narrow air-chambers E, arranged in relation to and in combination with the two exterior descending flues H, the interior or central flue or fire-passage S, the ash-pit F, air-chamber F, and fire-chamber A, substantially as set forth.

2. The arrangement of the pipes C and L in connection with the two dampers B and D, thus giving four different drafts, substantially as set forth.

137,728.—*Furniture-Caster.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed March 29, 1873.

The friction-balls confined in a cup-shaped ring, heretofore patented to this party, are arranged in novel combination with the upper plate of the horns of an ordinary furniture-caster and surrounding the stem of the same, this construction bringing the friction-balls in close contact with both the stem and plate, preventing sliding, and insuring the more equal distribution of strain upon the caster.

Claim.—The socket B, provided at top with the gimlet pointed wood-screw C, and at bottom with the internal annular recess *n*, in combination with the plate *f* of the horns *b*, stem *e*, and balls *d*, the latter being arranged in the cup-shaped annular recess, so as to be in close contact with both the stem *e* and plate *f*, as and for the purpose specified.

137,729.—*Windmill.*—ELIJAH S. SMITH, Good Hope, Ill. Application filed February 15, 1873.

This windmill, having no tail or guide-fan, under the influence of the wind, will necessarily swing to the leeward and receive the wind upon the opposite side from the ordinary wind-wheel. The brake-wheel is held in such relative position to the sails by means of a connecting-spring that the sails, when in their natural position, are exposed to the force of the wind, and they consequently revolve and give motion to the shaft and its connections.

Claim.—1. The combination of the brake-wheel, and mechanism for operating it, with sails adapted to be turned by the force of the wind, out of the wind, when the brake-wheel is held, substantially as described.

2. The combination of a brake-wheel, its operating mechanism, and fans adapted to be turned out of the wind, by the force of the wind, when the brake-wheel is held, with a spring adapted to draw the sails into the wind, substantially as described.

3. The combination of a float, and suitable connecting mechanism, with the brake-wheel, sails arranged as described, and the spring for drawing the sails into the wind, as described, for the purpose set forth.

4. The combination of the standard, of the revolving box, the vertically moving pump-box, and the revolving sleeve and connecting-rod, as described.

5. The combination of the brake and lever, and the connecting-rod, arranged as described, for the purpose set forth.

6. The windmill described, consisting essentially of the standard A, revolving box B, cross-bar C, shaft D, and wheel E F, brake-wheel H, spring I, brake J, lever K, and pitman L, with their connecting-parts combined and arranged as described.

137,730.—*Circuit for Electro-Magnets.*—JOHN E. SMITH, New York, N. Y. Application filed March 15, 1873.

Armature-lever near completion of its stroke brings a resistance into circuit, thus weakening force of current through magnet and lessening spark at circuit-breaker.

Claim.—The combination of a resistance coil or medium, and a circuit-breaking spring or lever with the armature-lever, or part or parts set in motion by an electro-magnet, the whole being arranged substantially as specified, whereby the resistance is brought into the circuit only as the armature completes its movement toward the magnet, and remains in the circuit until the latter is interrupted, essentially as and for the purposes herein set forth.

137,731.—*Milking-Pail.*—HENRY SPRINGER, Brady township, Mich. Application filed August 7, 1872.

To the spout of a milking-pail a receptacle is attached, the bottom of which is depressed below the spout and retains a portion of milk and froth to prevent spattering while milking.

Claim.—The receptacle *d*, when provided with a bottom, *e*, constructed to retain sufficient milk to prevent spattering, in combination with a spout, *c*, located at the side, substantially as specified.

137,732.—*School-Desk.*—MILAN C. STEBBINS and EDWIN J. PIPER, Springfield, Mass.; said STEBBINS assignor to said PIPER. Application filed February 25, 1873.

The desk is provided with a drawer having a secondary shelf attached beneath the bottom and a ledge on the front of the drawer for pens and pencils. About midway to the floor a book-shelf is placed.

Claim.—An improved school-desk having a drawer, B, therein provided with a secondary shelf, *c*, or atlas-case *b'*, and provided also with a ledge or pen and pencil rack, *c*, and having also the book-shelf F arranged below, all constructed and arranged substantially as described.

137,733.—*Grate for Stoves and Fire-Places.*—WILLIAM B. SUTOR, Indiana, Pa. Application filed September 21, 1872.

The supplemental rear grate, operated by the bell-crank, performs the office of a damper.

Claim.—The combination of the grate, the damper, and the perforated tile, operating together as and for the purpose described.

137,734.—*Fertilizing-Distributer.*—HUGH M. SWEENEY, Worcester, Mass., assignor of one-half his right to OTIS N. POND, same place. Application filed January 6, 1873.

A laterally-placed cylindrical chamber, on a tank supported by carriage-wheels, has on it a spindle with agitating arms actuated by gearing from one of the carriage-wheels. In this chamber manure and water are mixed and received into the tank; thence projected, through a strainer, to the ground as a fertiliser.

Claim.—The combination of the mixing-chamber *a*, revolving arms *c c c*, shaft *b*, tank *m*, strainer *t*, sprinkler or outlet *r*, driving-shaft *l*, and the gears *d e f g*, shaft *i*, or their equivalents, as and for the purpose herein shown and described.

137,735.—*Suspension-Hook for Eye-Glasses.*—WILLIAM S. TAPPAN, Washington, D. C. Application filed March 14, 1873.

The hook is made of a single piece of metal, and both ends form hooks which overlap each other. It requires two positive motions to connect or disconnect an object.

Claim.—A suspension-hook formed of a single piece, either end forming hooks which overlap each other, substantially as and for the purposes set forth.

137,736.—*Fertilizer-Spreader.*—JOHN W. THORNBURG, Woodstock, Va., assignor of one-half his right to LEONIDAS H. MCGINNIS, same place. Application filed November 9, 1872.

Two hoppers, one placed above the other and mounted on a pair of wheels which carry a cog-gear, giving motion to a distributing device. The fertilizing material is first sifted into the upper or receiving hopper, and from that received into the distributing-hopper, and from thence spread upon the ground.

Claim.—1. In a fertilizer-distributer the vibrating discharge-hopper B, having the arms B^2, studs B^3, ratchets B^1, and studded shaft *b*, arranged to impart a vertical motion to said hopper, substantially as and for the purpose set forth.

2. The combination of the removable hopper G, and vibrating discharge-hopper B, substantially as specified.

3. The slide or feed board D, racks F, and pinions F^2, combined and arranged with the hopper B, substantially as described.

137,737.—*Steam-Crane.*—DAVIS TILLSON, Rockland, Me. Application filed December 3, 1872.

A steam engine and crane mounted upon a platform-car in such manner that the engine shall operate the crane to load and unload the same car and move the car from place to place when the crane is not in use.

Claim.—1. The mast D and horizontal drum N combined with the platform-car by means of the grooved annular plates P and friction-balls *q*, substantially as described, for the purpose specified.

2. The sheave-cap R and mast cap E, constructed as described, and combined to operate in connection with each other, substantially as herein set forth, for the purpose specified.

3. In combination with a platform-car, supporting a steam-engine by which it is moved from place to place, a crane or derrick adapted for operation from the engine by means of the windlass, the winches, the hoisting-rope, the carriage, the mast-drum, and the turning-ropes, as herein described, for the purpose specified.

4. The mast of the derrick or crane supported upon the platform-car by means of the metal cap E, the wooden stays F, and metal tie-rods G, substantially as described, for the purpose specified.

5. The combination of the adjustable metal tie-rods G with the wooden mast-stays F, substantially as described, for the purpose specified.

6. The boom J constructed as described and supported upon the mast and drum N, substantially as set forth, for the purpose specified.

7. The derrick or crane mounted upon the platform-car and adapted to load and unload the same by means of a steam-engine mounted upon the car, substantially as described, for the purpose specified.

8. The boom of the derrick adapted for operation from the winched U' by means of the ropes T' and drum N, substantially as described, for the purpose specified.

9. The boom combined with the sheave-cap R by means of the adjustable rods X, substantially as described, for the purpose specified.

10. The hood Y in combination with the sheave *t* and its cap, substantially as described, for the purpose specified.

11. The boom-carriage constructed and operating as herein described, for the purpose specified.

12. The windlass and winches, together with their operating mechanism, combined with the hoisting and turning ropes in the manner described, for the purposes specified.

13. The rope W' arranged for operation in the manner described, for the purpose specified.

137,738.—*Cabinet Chair and Secretary Combined.*—CONSTANT S. TREVITT, Washington, D.C. Application filed November 2, 1872.

To one of the arms of the chair is hinged a desk-leaf support, to which is pivoted the desk-leaf. To the inner side of the arm of the chair is arranged a spring-catch to hold the desk-leaf support when in position for use of the desk. Beneath the support is an inkstand that is covered by the hinged support when not in use, and in the other arm of the chair is a hinged or pivoted receptacle for pens. Underneath the seat of the chair is a series of drawers provided with a catch or hook, a stop, and a central handle.

Claim.—1. In a combined chair and writing-desk, the support L, hinged as described, in combination with the desk-leaf M pivoted thereto, as and for the purpose described.

2. The spring-catch N located and arranged as described, in combination with the hinged platform or support L, as and for the purpose described.

3. The hinged pen-receptacle Q arranged and inclosed within the chair arm, as and for the purpose described.

4. The chair-drawers having the catch G H, stop I, and central handle F, arranged as and for the purpose described.

5. The inkstand O arranged as described, in combination with the hinged support L, as described.

6. The combination in a chair and writing-desk of the pivoted leaf M, the hinged support L, spring-catch N, inkstand O, and pen-receptacle Q, the several parts being constructed and arranged for use as described.

137,739.—*Carpet-Stretcher.*—OLIVER VANORMAN, Fond du Lac, Wis. Application filed February 26, 1873.

A movable slide is combined with the bed-piece and has cogs upon its upper side and teeth affixed to the under side of its arm or projecting end. Standards arise from the bed-piece that support a segment of a cogged wheel that engages with the cogs on the slide. The segment-frame has a lever-arm to operate it. A dog is attached to bed-piece and engages with the notches of the slide to hold it in a desired position. An extension-bar is attached to the rear end of the bed-piece.

Claim.—The combination of the bed-piece A, the movable slide B with sectional teeth F, the ratchet C, together with the standard D and dog E, also the extra bar or slat *i*, as and for the purposes specified.

137,740.—*Basement-Floor.*—ELEAZAR S. VAUGHAN, Flatbush, N. Y. Application filed February 5, 1873.

Claim.—1. The tiles B, constructed so that when laid they form water ways or channels *b* all around them below their upper edges, substantially as and for the purpose herein set forth.

2. The combination, with the tiles B, reduced around their edges to form grooves or channels, as described, of the waterproof layer C and upper stratum D of concrete or other weighty material, essentially as specified.

3. The inner side walls G, laid in and coated with asphaltum A H, in combination with the floor-layers C D E and base-tiles B, constructed to effect drainage, as described.

137,741.—*Machine for Rolling Scythes.*—HERVEY WATERS, Northbridge, Mass. Application filed February 13, 1865.

Three pairs of rolling-dies for rolling scythes—one pair at each end of the rolls outside the bonaings, and one pair between the housings—to be used successively in the reduction of the bar to the proper shape.

Claim.—A suit of roller-dies, made and operating substantially as described.

137,742.—*Apparatus for Converting Iron into Steel.*—JAMES WEBSTER, Birmingham, England. Application filed October 24, 1872.

The retorts are provided with inlet-pipes having mixing-nozzles for the admission of air and gases, and stand or outlet pipes to conduct the waste gases to a receiver, from whence they may be taken and utilised. The nozzle consists of two cones; the gas, passing through the inner, draws in air through perforations in the outer cone.

Claim.—1. The described furnace, having the retorts A B, pipes M N O, and nozzles C D, arranged as described, for the purpose set forth.

2. The improved nozzle shown in Figs. 7 and 8, Sheet 3, for admitting, regulating, and mixing the gases into the retorts, as herein described.

137,743.—*Metallic Lathing.*—CHARLES WELDING, New York, N. Y. Application filed March 5, 1873.

Claim.—A metallic lath with the flanged edges corrugated, for the purposes and substantially as specified.

137,744.—*Earth-Auger.*—ICHABOD M. WEST, Summit, assignor of one-half his right to HENRY A. IDDINGS, Crete, Neb. Application filed February 18, 1873.

Claim.—1. The sectional helices F formed with sleeves or collars G, the adjoining ends of which are connected by lap or rabbet joints for forming a continuous worm, as herein set forth.

2. The well-augur herein described consisting of the angular stem A, point B, stationary wing C, detachable cutter E, and worm or helix formed of a series of separate and detachable sections, F G, connected and relatively arranged with each other in the manner specified.

137,745.—*Button-Hole Cutter and Punch.*—AUGUSTUS L. WHITNEY, Fitchburg, Mass. Application filed February 21, 1873.

The punches and cutter are attached to a revolving sleeve, a suitable locking mechanism detaining the cutter or punches in position for its proper action. An adjustable gage, in combination with the sealed blade, determines the length of button-hole.

Claim.—1. In combination with the cutter, one or more punches, *q r*, the punch or punches and the blade being attached to the sleeve *g*, substantially as shown and described.

2. The combination of the screw-stop *p* in the shank with the sealed knife-blade, substantially as and for the purpose set forth.

137,746.—*Process and Apparatus for Extracting the Juices of Sugar-Cane, &c.*—GEORGE WILKINSON, ANTOINE L. POSSOZ, JEAN P. LAFARGUE, and AUGUSTE E. DUTHEIL, Paris, France. Application filed March 26, 1873.

The cane, in the form of chips, is fed continuously through vats provided with screws which carry them back and forth. The liquid to form the extract is applied so as to become constantly stronger, the fresh liquid being applied to the nearly-exhausted chips.

Claim.—1. The mode herein described of extracting the saccharine matter of cane and other saccharine substances, by subjecting the same, when suitably prepared or divided, to the action of heated saccharine juice, followed by washing in a mixture of dilute juice and pure water, said operations being conducted in apparatus substantially such as specified, and in the manner set forth.

2. The combination of two or more macerators, substantially such as described, into and through which the prepared cane or other saccharine substance is successively passed, as set forth, the liquids with which said substance is treated during its passage through said macerators being obtained and supplied to and discharged from said macerators substantially in the manner specified.

3. An apparatus for extracting the juices of sugar-cane and other saccharine vegetable substances, the parts of which are constructed, combined, and arranged for operation substantially as herein shown and set forth.

137,747.—*Preparing Gold for Dentists.*—RICHARD S. WILLIAMS, New York, N. Y. Application filed December 18, 1872.

Two or more sheets of plain foil with an outer sheet of frosted gold are rolled into a cylinder over a mandrel, and the lapping edge of foil caused to adhere by passing it over the flame of an alcohol-lamp. The frosted gold, by its greater stiffness, will prevent the several folds forming the coil from adhering.

Claim.—1. Gold for dentists' use, consisting of sections cut from rolls composed of plain and frosted gold foil, when the ends of such sections are not compressed or consolidated, as herein shown and described.

2. Rolls of gold for dentists' use, composed of sheets of plain and frosted gold foil, as described, with the edge connected, as specified, so as to adhere to the gold and prevent it from unrolling.

137,748.—*Device for Adjusting Millstones.*—ALEXANDER W. WINALL, Cincinnati, Ohio. Application filed March 17, 1873.

The bridge-tree is suspended and rendered simultaneously adjustable at each end.

Claim.—In combination with the bridge-tree K, the threaded rods N, worm-gear O, shaft P, and worms Q, substantially as and for the purpose specified.

137,749.—*Apparatus for Molding Cigars.*—THOMAS J. WINSHIP, Montreal, Canada. Application filed February 24, 1873.

A series of leaves or plates are arranged one above another, the dies being formed on one side and the matrices on the other, the leaves sliding upon end rods which are joined by a cross-bar at the top. The leaves are provided with pivoted handles and pins at each end, which serve to secure them together either at the bottom of the press, when filled with cigars, or suspended at the top when empty.

Claim.—The combination of the leaves, provided with handles and pins, as described, with guides *g* and cross-bar A, all constructed and arranged to operate as described.

137,750.—*Manufacturing Illuminating-Gas.*—WILLIAM C. WREN, Brooklyn, N. Y. Application filed March 11, 1873.

Illuminating-gas is manufactured from hydrocarbons by carrying the fluid, when vaporized, over a sufficient surface to decompose it. The vapor must not be allowed to cool at any part of the passage. The end of the retort is closed by a cap having a A-shaped projection fitting into a V-shaped groove on the face of the retort, and a lip projecting into the chamber. A siphon passes through the lid into the retort for conveying the petroleum into the same.

Claim.—1. A compound retort divided longitudinally, so that one or more of the sections shall project beyond and be longer than the others, as described.

2. The compound retort, as described, in combination with the lid K to close the chamber W, as described, with the lid L to close the chambers S T U, as described.

3. The A-shaped projection N in combination with the lips O on the covers, and the grooves P on the faces of a compound retort, as described.

4. The combination of two or more covers for one end of a compound retort, as described.

5. The siphon M with the projection through the cover L and into the chamber S, for the purpose as described.

6. The siphon projecting as shown, in combination with the lid K and lid L and compound retort, as and for the purpose described.

137,751.—*Hay-Loader.*—THOMAS P. DAVIDSON and ALF PARVIS, Liberty, Ind. Application filed February 5, 1873.

An endless-chain elevator is assisted by toothed bars operated by cranks, separately driven by cord and pulleys from the supporting-wheels.

Claim.—The combination of the endless carrier *d's* and the rakes H H connected to and operated by the crank-shafts G G, substantially as set forth.

REISSUE PATENTS.

5,347.—*Loom for Weaving Pile-Fabrics.*—SUSAN C. DAVIS, New York, N. Y., administratrix of EZEKIEL K. DAVIS, deceased. Patent No. 86,651, dated February 9, 1869. Application filed March 21, 1873.

Claim.—1. In combination with a wire-carrier oscillating upon an axis parallel to that of the lay, but not coincident with it, a reciprocating carriage provided with a latch traveling upon the wire-carrier and operating to withdraw the wires successively from the pile and return them to the shed without, in the meantime, becoming disengaged from the wire.

2. The combination, with a wire-carrier oscillating upon an axis parallel to that of the lay, and a reciprocating carriage provided with a latch, traveling upon such carrier, of a plate arranged to raise the latch and sustain it while passing over the heads of the wires.

3. In combination with a latch to draw the wires from the pile, having a reciprocating movement longitudinally and transversely, a plate or its equivalent placed so as to release the latch from the inserted wire and support it while passing from one side to the other of the row of wires.

4. In combination with the wires and reciprocating carriage, an automatically-adjustable pin, supporting the end of the wire drawn from the wire-box, and which is retracted through the side of the wire-carrier as the carriage approaches, so as not to interfere with its movements.

5. In combination with the wire-carrier A, the carriage C, latch *f*, spring *g*, lever A, spring *i*, and plate J.

6. The sliding shuttle-box H, combined with arms *x x*, rocker-shaft *t*, lever *u*, and cam-plate J.

7. The cams K L and gear O arranged on a sleeve surrounding the shaft *c*, in combination with said shaft, cams P Q, and operating-gear and heddles.

5,348.—*Band-Comb.*—CHARLES HORACE NOYES, Orange, N. J.—Patent No. 106,861, dated August 30, 1870. Application filed March 10, 1873.

Claim.—1. A head-band constructed with openings *c*, and provided with a comb or comb-teeth for holding said band on the head, substantially as described.

2. In combination with a head-band constructed as above described, a ribbon or other ornamental material interwoven with said openings, substantially as and for the purpose specified.

5,349.—*Billiard-Table Cushion.*—GEORGE D. SHARP, New York, N. Y.—Patent No. 26,128, dated November 15, 1859. Application filed March 10, 1873.

Claim.—1. A cushion for billiard-tables, composed wholly of India rubber or other analogous elastic material, having formed or molded within it an open air-space, chamber, or cavity, its entire length, in its configuration conforming substantially to the shape of the cushion, in the manner and for the purpose herein set forth.

2. In a cushion for billiard tables, the combination of the open air-space, chamber, or cavity E, cushion D, and facing F, in the manner and for the purpose herein described.

INDEX OF INVENTIONS PATENTED APRIL 8, 1873.

[The numbers in parentheses denote the classification of patents.]

Acid phosphates, manufacture of, (35,) Storck and Lyte... 137,635
Addressing machine, (146,) F. A. Darling 137,599
Alarm, burglar, (34,) J. F. Coppock 137,532
Animal matter, treating and drying, (36,) W. C. Marshall 137,699
Auger, earth, (51,) I. M. West 137,744
Bale tie, (7,) J. W. Hedenberg 137,549
Bale tie, cotton, (7,) W. C. Ramsay 137,570
Barrel cover, (88,) G. Hunt 137,683
Barrel header, (93,) C. B. Pettengill 137,567
Bath tub plug socket, (8,) R. C. Seringeour 137,726
Battery, galvanic, (50,) R. M. Lockwood 137,556
Bed lounge, (92,) G. Hartsell 137,677
Bedstead, folding, (62,) J. L. Kilgore 137,690
Bedstead, invalid, (62,) Clinton and Morgan 137,596
Bedstead, wardrobe, (62,) J. Smith 137,698
Bee hive, (3,) D. McC. Calvin 137,530
Bee hive, (3,) E. H. Woodside 137,645
Billiard table cushion, (143,) G. D. Sharp, (reissue) 5,349
Blacking case, (16,) G. H. Rice 137,722
Blower, piston, (12,) C. W. Isbell 137,353
Bobbin heads, machine for turning, (100,) C. M. Spencer .. 137,631
Boiler, culinary, (134,) S. S. Fitch 137,694
Boiler, wash, (136,) C. H. Dunbrack 137,663
Boiler, wash, (136,) O. F. Glidden 137,545
Boiler, wash, (136,) P. Krumscheid 137,612
Bolt machine, (14,) J. O. Jones 137,698
Boot and shoe crimper, (16,) C. Glants 137,543
Brace coupling, adjustable, (43,) C. M. Hall 137,669
Breakwaters, construction of, (82,) D. Cunningham 137,859
Broom, (22,) F. Ecco 137,731
Brush, horse, (144,) R. Dickson 137,536
Buckle, harness, (23,) J. McLean 137,558
Buggy, (31,) C. T. Stoddard 137,577
Button hole cutter and punch, (38,) A. L. Whitney 137,745
Can shield, shipping, (107,) H. M. Smith 137,627
Car coupling, (122,) D. C. Merris 137,617
Car coupling, (122,) A. Pursell 137,719
Car coupling, (122,) J. P. Whipple 137,642
Carpet stretcher, (62,) O. Vanorman 137,739
Carriage step, (31,) C. H. Gould 137,547
Cartridges, tool for capping, (32,) J. L. Raub 137,720
Casks, construction of metallic, (136,) J. I. Bard 137,590
Caster, furniture, (24,) C. B. Sheldon 137,728
Chair, child's, (62,) Harris and Childs 137,610
Chair, knock down, (62,) C. R. Long 137,613
Chair and secretary, combined, (62,) C. S. Trevitt 137,738
Chimney cowl, (166,) W. H. Myers 137,561
Cigar wrappers, cutting, (160,) R. Appleby 137,524
Cigars, apparatus for molding, (160,) T. J. Winship 137,749
Clasp for stocking supporters, (38,) S. K. Ellis 137,539
Clock escapement, (36,) C. Fasoldt 137,603
Coal, machine for cutting, (124,) S. Firth 137,669
Collar, shirt, (38,) O. P. Dorman 137,537
Comb, band, (161,) C. H. Noyes, (reissue) 5,348
Compositor's stand, (117,) F. Vallee 137,639
Cooler, milk, (45,) W. D. McDonald 137,557
Corset, (90,) M. Russell 137,724
Cot, spring, (62,) T. J. Griffin 137,675
Cotton chopper, (43,) W. Price 137,715
Cultivator, (43,) L. Baldwin 137,649
Cultivator, (43,) J. R. McDonald 137,703
Currier tool, (92,) Gardner and Enos 137,671
Dentist's flask, (46,) C. Bailey 137,589
Dentists, preparing gold for, (46,) R. S. Williams 137,747
Desk, school, (62,) Stebbins and Piper 137,732
Electro magnets, circuit for, (50,) J. E. Smith 137,730
Elevated way, (120,) H. W. Farley 137,667
Engines, governor for steam, (60,) J. M. Bottum 137,652
Engines, governor for steam, (60,) B. B. Smith 137,573
Evaporator, sugar, (155,) H. C. and T. W. Stevens 137,576
Eye glasses, suspension hook for, (157,) W. S. Tappan 137,735
Fan, automatic, (165,) F. W. Jones 137,687
Fats, purifying and separating, (26,) A. Paraf 137,564
Fatty and coloring matters from waste wash liquors, recovering, (26,) Thom and Stenhouse 137,636
Felly plate, (31,) H. Sylvester 137,571
Fence, rail, (52,) J. W. Mathews 137,701
Fence, wood, (52,) W. Riley 137,723
Fertilizer, (133,) J. W. York 137,586
Fertilizer spreader, (133,) J. W. Thornburg 137,736
Fertilizing distributer, (133,) H. M. Sweeney 137,734
Filter, (167,) Brown and Foskett 137,653
Fire arm, breech loading, (18,) C. Sharpe 137,625
Fire and water proof roofing, (128,) E. R. Percy 137,566
Floor, basement, (30,) E. S. Vaughan 137,740
Fruit drier, (48,) J. Stevenson 137,634
Fruit loosener, dried, (88,) C. Ragan 137,622
Furnace, heating, (154,) E. W. Crane 137,598
Furnace, hot air, (154,) S. F. Gold 137,546
Furnace, hot air, (154,) M. D. Seward 137,727
Furnace lining, metallurgic, (99,) S. Lansdowne 137,554
Gas, lime, &c., obtaining sulphur, sulphuric acid, and sulphurets of sodium and potassium from, (35,) J. Kircher 137,692
Gas, manufacture of, (66,) E. H. Patterson 137,713
Gas, manufacturing illuminating, (27,) W. C. Wren 137,750
Gas, purifying carbonic acid, (35,) A. P. Meylert 137,615
Gas retort closing, (66,) G. A. Mollhonney 137,704
Gas works hydraulic main, (65,) P. T. Burtis 137,655
Governor, (60,) J. B. Duff 137,662
Grain drier, (48,) E. S. Forgy 137,606
Grapple, (79,) J. Burkhart 137,592
Harrow, (73,) W. H. Platt 137,569
Harvester, (74,) McCandlish and Naginey 137,614
Harvester cutter, (74,) W. McKeever 137,705
Hay loader, (77,) Davidson and Parvis 137,751
Hinge, (24,) A. Rankin 137,623
Horse collar, (72,) W. Guilfoyle 137,606
Horse power, (159,) H. M. Irwin 137,694
Horseshoes, interfering attachment to, (60,) H. S. Davis.. 137,660
Injector, steam, (118,) S. and J. Benson 137,651
Inkstand, (146,) Hawson and Sweeney 137,543
Iron and steel, manufacture of, (85,) Pedder and Abel 137,621
Iron into steel, converting, (85,) J. Webster 137,742
Iron, manufacturing sheet, (85,) W. D. Wood 137,585
Joint, universal, (67,) J. Troxel 137,578
Knife handle, pocket, (44,) J. W. Ayers 137,648
Knitting machine, (89,) Platt and Stanbery 137,568
Ladder, extensible, (30,) Hearne and Adams 137,679
Ladder, foldiug, (30,) White and Kea 137,582
Lamp chimney cleaner, (154,) R. G. Forsythe 137,670
Lamp, street, (90,) M. B. Dyott 137,536
Lard, rendering, (36,) W. C. Marshall 137,698
Last, (16,) W. J. B. Mills 137,616
Latch, reversible knob, (93,) C. S. Jennings 137,685
Lathe chuck, (100,) S. C. Goodsell 137,674
Lathing, metallic, (30,) C. Welding 137,743
Leg, artificial, (5,) B. F. Palmer 137,711
Liquid meter, (167,) F. A. Morley 137,559
Loom for weaving pile fabrics, (95,) E. K. Davis, (reissue). 5,347
Loom shuttle guard, (95,) C. H. Hudson 137,551

Looms, beam and roller for, (95,) G. L. Garsed 137,672
Mattress, spring, (62,) H. A. Gaston 137,673
Mattresses, seats, &c., flexible support for, (62,) C. Pollinger 137,718
Medical compound, (98,) H. Gahn 137,542
Medical compound, (98,) W. E. Rose 137,624
Milestones, device for adjusting, (57,) A. W. Winall 137,748
Mower, lawn, (75,) S. D. King 137,691
Musical instrument, (102,) J. and H. W. Whitney 137,643
Nail plate feeder, (103,) S. K. Paden 137,710
Nut lock, (14,) J. McC. Allison 137,646
Oyster dredges, machine for raising, (143,) W. T. Howard 137,550
Pail, milking, (45,) H. Springer 137,731
Paper bags, constructing, (109,) L. C. Crowell 137,533
Paper stock, machine for washing, (108,) G. L. Lovett 137,696
Piano and organ key, (112,) Goffrie and Schucht 137,544
Picture mounting machine, (146,) E. B. Christmas 137,636
Pipe joint, (167,) Prosser and Morgan 137,717
Pipes, connecting cement water and gas, (167,) G. C. Nichols 137,562
Planter, corn, (133,) A. C. Martin 137,700
Planter, corn, (133,) J. Nitkey 137,563
Plow, (114,) W. Price 137,716
Plow, gang, (114,) G. W. Mannel 137,697
Plow, wheel, (114,) Janes, Tucker, and Terry 137,611
Press, (7,) W. E. Warner 137,641
Press for printing fabrics, (11,) H. H. Townsend 137,638
Presses, fan fly attachment for cylinder, (7,) P. A. Cotter. 137,597
Printer's miter machine, (117,) J. A. Stansbury 137,575
Printing press, hand, (117,) W. and W. H. Dunkerly 137,664
Privies and sinks, cleaning, (8,) A. M. Hobbe 137,680
Pump, (118,) W. D. Baxter 137,527
Railroad gate, (52,) C. S. Currie 137,534
Railroad rail joint, (120,) T. V. Allis 137,587
Railroad safety guard, (121,) C. Latimer 137,694
Railroad switch, (120,) H. S. Dewey 137,535
Railway, elevated arch, (120,) Hulbert and Aubin 137,552
Refrigerator and water cooler combined, (58,) J. S. Bateman 137,630
Regulator, feed water, (69,) E. C. Fernald 137,541
Sash holder, (24,) R. B. Hugunin 137,688
Saw grinding machine, (131,) D. M. Mefford 137,706
Saw set, (131,) C. E. Grandy 137,607
Saw sharpening device, (131,) C. Willard 137,644
Sawing machine, (130,) C. H. Smith 137,626
Sawing machine, (130,) S. Wheeler 137,581
Sawing machine, band, (130,) B. D. Whitney 137,583
Scythe stone holder, (123,) Morrison and Fletcher 137,560
Scythes, machine for rolling, (49,) H. Waters 137,741
Seeding machine, (133,) S. B. Miller 137,708
Sewing machine, (134,) J. O'Neil 137,618
Sewing machine, (134,) G. C. Walters 137,640
Sewing machine, button hole, (134,) G. Kallmeyer 137,689
Sewing machine ruffling or plaiting attachment, (134,) A. Johnston 137,686
Sewing machine shuttle, (134,) C. W. Ells 137,665
Sewing machine, wax thread, (134,) E. E. and F. Bean 137,528
Shafting, hanger for, (67,) W. W. Carey 137,593
Sheet metal elbows, construction of, (136,) L. Bancroft 137,525
Shutter, corrugated metallic rolling, (4,) A. Clark 137,595
Shutter fastening, (24,) E. D. Anderson 137,647
Skate, (143,) E. H. Barney 137,526
Skate heel plate, (143,) G. Havell 137,678
Soda water apparatus, (1) J. Matthews 137,702
Soda water apparatus, draft faucet for, (1,) J. Patterson.. 137,620
Spike machine, (103,) T. O'Connor 137,709
Spike, molder's draw, (33,) R. A. Thompson 137,637
Spool heads, machine for embossing, (54,) L. H. Dwelley.. 137,601
Spring, door and gate, (24,) C. N. Owen 137,619
Spring, furniture, (62,) W. T. Doremus 137,600
Stage machinery, (54,) J. Schonberg 137,725
Stalk cutter, (73,) S. B. Miller 137,707
Steam crane, (79,) D. Tillson 137,737
Steering apparatus for vessels, (137,) H. J. Smith 137,574
Stirrup, (72,) J. S. Fee 137,668
Stove, portable, (154,) N. E. Chase 137,594
Stoves and fire places, grate for, (154,) W. B. Sutor 137,733
Stoves and furnaces, automatic draft regulator for, (154,) Sprague and Osgood 137,632
Sugar cane, &c., extracting the juices of, (155,) Wilkinson, Possos, Lafargue, and Dutrelh 137,746
Table, folding, (62,) S. V. Cornell 137,658
Table, folding ironing, (91,) W. Edwards 137,602
Tent, (162,) E. M. Turner 137,579
Threshing machine, (159,) Lippy and Rymer 137,695
Tin scraps, recovering tin from waste, (99,) H. Panton ... 137,712
Toy perambulator, (143,) J. S. Krinks 137,693
Trap, insect, (63,) J. W. Anderson 137,588
Uterine supporter, (156,) H. N. Caner 137,531
Valve, balanced, (152,) N. H. Bundy 137,654
Valve, safety, (152,) E. C. Fernald 137,540
Vehicle, (31,) Coffee and Bernard 137,657
Vehicle wheel, (31,) O. D. Spalding 137,629
Vehicles, recording apparatus for, (42,) Guebhard and Tronchon 137,676
Wagon brake, (31,) W. B. Stanley 137,633
Wagons, jump seat for, (31,) C. H. Howell 137,681
Wagons, trestle platform for unloading, (79,) J. K. Wilson 137,584
Warping machines, stop mechanism for, (17,) Follensbee and Entwistle 137,605
Washer, steam, (136,) C. A. Bradley 137,591
Washing machine, (91,) P. A. Downer 137,661
Water wheel, (168,) H. R. Weaver 137,580
Water wheel, turbine, (168,) W. H. Elmer 137,606
Well curb, (51,) N. H. Lindley 137,555
Wells, device for cleaning, (51,) W. F. Brown 137,529
Windmill, (118,) J. B. Park 137,565
Windmill, (118,) E. S. Smith 137,720
Window platform, portable, (30,) G. H. Peabody 137,714
Windows water proof, making, (39,) B. Smith 137,572
Wire, machine for turning and cutting, (100,) C. M. Spencer 137,630

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED APRIL 8, 1873.

Abel and Pedder 137,621
Adams and Hearne 137,679
Allis, T. V., Railroad rail joint 137,587
Allison, J. McC., Nut lock 137,646
Anderson, E. D., Shutter fastening 137,647
Anderson, J. W., Insect trap 137,588
Appleby, R., Apparatus for cutting cigar wrappers 137,524
Aubin and Hulbert 137,552
Ayers, J. W., Handle for pocket knives 137,648
Bailey, C., Dentist's flask 137,589
Baldwin, L., Cultivator 137,649
Bancroft, L., Construction of sheet metal elbows 137,525
Bard, J. I., Construction of metallic casks 137,590
Barney, E. H., Skate 137,526
Bateman, J. S., Refrigerator and water cooler combined .. 137,630
Baxter, W. D., Pump 137,527
Bean, E. E., and F., Wax thread sewing machine 137,528
Benson, S. and J., Steam injector 137,651
Bernard and Coffee 137,657
Blakeslee, C., assignee 137,693
Blymer and Lippy 137,695
Bottum, J. M., Governor for steam engines 137,652
Bradley, C. A., Steam washer 137,591
Brown, J. E., and W. A. Foskett, Filter 137,653
Brown, L., assignee 137,525
Brown, W. F., Device for cleaning wells 137,529
Bryant, W. G., assignee 137,525
Bundy, N. H., Balanced valve 137,654
Burkhart, J., Grapple 137,592
Burtis, P. T., Gas work hydraulic main 137,655
Calvin, D. McC., Bee hive 137,530
Caner, H. N., Uterine supporter 137,531
Carey, W. W., Hanger for shafting 137,593
Chase, N. E., Portable stove 137,594
Childs and Harris 137,610
Christmas, E. B., Picture mounting machine 137,656
Clark, A., Corrugated metallic rolling shutter 137,595
Clinton, C. M., and E. J. Morgan, Invalid bedstead 137,596
Coffee, G., and W. M. Bernard, Vehicle 137,657
Coomb's, W. F., assignee 137,589
Coppock, J. F., Burglar alarm 137,532
Cornell, S. V., Folding table 137,658
Cotter, P. A., Fan fly attachment for cylinder presses 137,597
Crane, E. W., Heating furnace 137,598
Crane, L., assignee 137,533
Crowell, L. C., Constructing paper bags 137,533
Cunningham, D., Construction of breakwaters 137,859
Currie, C. S., Railroad gate 137,534
Darling, F. A., Addressing machine 137,599
Davidson, T. P., and A. Parvis, Hay loader 137,751
Davis, E. K., Loom for weaving pile fabrics, (reissue) 5,347
Davis, H. S., Interfering attachment to horseshoes 137,660
Davis, R., assignee 137,554
Dewey, H. S., Railroad switch 137,535
Dickson, R., Horse brush 137,536
Dilley, J., assignee 137,554
Doremus, W. T., Furniture spring 137,600
Dorman, O. P., Shirt collar 137,537
Downer, P. A., Washing machine 137,661
Duff, J. B., Governor 137,662
Dunbrack, C. H., Wash boiler 137,663
Dunkerly, W. and W. H., Jr., Hand printing press 137,664
Dutrelh Wilkinson, Possos, and Lafargue 137,746
Dwelly, L. H., Machine for embossing spool heads 137,601
Dyott, M. B. Street lamp 137,536
Edwards, W., Folding ironing table 137,602
Ellis, S. K., Clasp for stocking supporters 137,539
Ells, C. W., Shuttle for sewing machines 137,665
Elmer, W. H., Turbine water wheel 137,606
Enos and Gardner 137,671
Entwistle and Follensbee 137,605
Farley, H. W., Elevated way 137,667
Fasoldt, C., Clock escapement 137,603
Fee, J. S., Stirrup 137,668
Fernald, E. C., Safety valve 137,540
Fernald, F. C., Feed water regulator 137,541
Firth, S., Machine for cutting coal 137,669
Fitch, S. S., Culinary boiler 137,694
Fletcher and Morrison 137,560
Follensbee, G. S., and T. C. Entwistle, Stop mechanism for warping machines 137,605
Forgy, E. S., Grain drier 137,606
Forsyth, R. G., Lamp chimney cleaner 137,670
Foskett and Brown 137,653
Fowle, W. B., assignee 137,574
Fowler, R. A., assignee 137,545
Gahn, H., Medical compound 137,542
Gardner, C. A., and J. A. Enos, Currier tool 137,671
Garsed, G. L., Beam and roller for looms 137,672
Gaston, H. A., Spring mattress 137,673
Glants, C., Boot and shoe crimper 137,543
Glidden, O. F., Wash boiler 137,545
Goffrie, C. F. L., and J. H. Schucht, Piano and organ key. 137,544
Gold, S. F., Hot air furnace 137,546
Goodsell, S. C., Lathe chuck 137,674

Gould, C. H., Carriage step 137,547
Grandy, C. E., Saw set 137,607
Griffin, T. J., Spring cot 137,675
Guebhard, A., and A. P. Tronchon, Recording apparatus for vehicles 137,676
Guilfoyle, W., Horse collar 137,608
Hall, C. M., Adjustable brace coupling 137,609
Harris, G. W., assignee 137,593
Harris, J. F., and E. D. Childs, Child's chair 137,610
Hartzell, G., Bed lounge 137,677
Havell, G., Skate heel plate 137,678
Hawson, S., and T. Sweeney, Inkstand 137,548
Heald, W. D., assignee 137,607
Hearne, J. C., and D. Adams, Extensible ladder 137,679
Hedenberg, J. W., Bale tie 137,549
Hobbs, A. M., Cleaning privies and sinks 137,680
Howard, W. T., Machine for raising oyster dredges 137,550
Howell, C. H., Jump seat for wagons 137,681
Howsley, B., assignee 137,329
Hudson, C. H., Loom shuttle guard 137,551
Huganin, R. B., Sash holder 137,682
Hulbert, E. J., and A. N. N. Aubin, Elevated arch railway 137,552
Hunt, G., Barrel cover 137,683
Iddings, H. A., assignee 137,744
Irwin, H. M., Horse power 137,684
Isbell, C. W., Piston blower 137,553
Ives, E. R., assignee 137,693
Janes, J. H., H. Tucker, and T. D. Terry, Wheel plow 137,611
Jennings, C. S., Reversible knob latch 137,685
Johnston, A., Ruffing or plaiting attachments for sewing machines 137,686
Jones, F. W., Automatic fan 137,687
Jones, J. O., Bolt machine 137,688
Kallmeyer, G., Button hole sewing machine 137,689
Kee and White 137,582
Killgore, J. L., Folding bedstead 137,690
King, S. D., Lawn mower 137,691
Kircher, J., Obtaining sulphur, &c., from gas, lime, &c 137,692
Krinks, J. S., Toy perambulator 137,693
Krumscheid, P., Wash boiler 137,612
Lafargue, Dutreih, Wilkinson, and Possez 137,746
Lansdowne, S., Metallurgic furnace lining 137,554
Latimer, C., Safety guard for vehicles 137,694
Lindley, N. H., Well curb 137,555
Lippencott, C., & Co., assignees 137,610
Lippy, D., and J. S. Blymer, Thrashing machine 137,695
Lockwood, R. M., Galvanic battery 137,556
Long & Brothers, assignees 137,613
Long, C. R., Knock down chair 137,613
Lovett, G. L., Machine for washing paper stock 137,696
Lyte and Storck 137,635
Manuel, G. W., Gang plow 137,697
Marshall, W. C., Apparatus for treating and drying animal matter 137,699
Marshall, W. C., Apparatus and process for rendering lard 137,698
Martin, A. C. Corn planter 137,700
Matthews, J. W., Rail fence 137,701
Matthews, J., Soda water apparatus 137,702
McCandlish, C. N., and J. C. Naginey, Harvester 137,614
McDonald, J. R., Cultivator 137,703
McDonald, W. D., Milk cooler 137,557
McDonald, W. H., assignee 137,373
McGinnis, L. H., assignee 137,736
McIlhenney, G. A., Gas retort closing 137,704
McKeever, W., Harvester cutter 137,705
McLean, J., Harness buckle 137,558
Mefford, D. M., Saw grinding machine 137,706
Merrill, F. C., assignee 137,567
Meylert, A. P., Purifying carbonic acid gas 137,615
Miller, S. B., Stalk cutter 137,707
Miller, S. B., Seeding machine 137,708
Mills Shoe Machine and Manufacturing Company, assignee 137,616
Mills, W. J. B., Last 137,616
Morgan and Clinton 137,506
Morgan and Prosser 137,717
Morley, F. A., Liquid meter 137,559
Morris, D. C., Car coupling 137,617
Morrison, J. L., and T. H. Fletcher, Sythe stone holder 137,560
Morton, G. W., assignee 137,586
Murray, J. H., assignee 137,586
Myers, W. H., Chimney cowl 137,561
Naginey and McCandlish 137,614
Nichols, G. C., Connecting cement, water, and gas pipes 137,562
Nitkey, J., Corn planter 137,563
Noyes, C. H., Band comb, (reissue) 5,348
O'Connor, T., Spike machine 137,709
Oleomargarine Manufacturing Company, assignee 137,564
O'Neil, J., Sewing machine 137,618
Osgood and Sprague 137,632
Owen, C. N., Door and gate spring 137,619
Paden, S. K., Nail plate feeder 137,710
Palmer, B. F., Artificial leg 137,711
Panton, H., Recovering tin from waste tin scraps 137,712
Paraf, A., Purifying and separating fats 137,564
Park, J. B., Windmill 137,565
Parker and Whipple Company, assignee 137,685
Parker, C., assignee 137,720
Parvis and Davidson 137,751
Patterson, J., Draft faucet for soda water apparatus 137,620
Patterson, R. H., Manufacture of gas 137,713
Peabody, G. H., Portable window platform 137,714
Pedder, J., and G. Abel, Manufacture of iron and steel 137,621
Percy, E. R., Fire and water proof roofing 137,566
Pettengill, C. B., Barrel header 137,567
Pierce, R. V., assignee 137,710
Piper and Stebbins 137,732
Platt, C. H., and G. A. Stanbery, Knitting machine 137,568
Platt, W. H., Harrow 137,569
Pond, O. N., assignee 137,734
Pope, F. L., assignee 137,556
Possez, Lafargue, Dutreih, and Wilkinson 137,746
Price, W., Cotton chopper 137,715
Price, W., Plow 137,716
Prosser, T. T., and G. C. Morgan, Pipe joint 137,717
Pullinger, C., Flexible support for mattresses, seats, &c 137,718
Purcell, A., Car coupling 137,719
Ragan, C., Dried fruit loosener 137,622
Ramsay, W. C., Cotton bale tie 137,570
Rankin, A., Hinge 137,623
Raub, J. L., Tool for capping cartridges 137,720
Reese, F., Broom 137,721
Rice, G. H., Blacking case 137,722
Riley, W., Wood fence 137,723
Rose, W. E., Medical compound 137,624
Russell, M., Corset 137,724
Sands and Baxter, assignee 137,567
Sawyer, W. H., assignee 137,556
Schonberg, J., Stage machinery 137,725
Schoneman, R. A., assignee 137,618
Schucht and Goffrie 137,544
Scrimgeour, R. C., Bath tub plug socket 137,726
Seward, M. D., Hot air furnace 137,727
Sharp, G. D., Billiard table cushion, (reissue) 5,349

LYNCH AND RAFF *vs.* DRYDEN AND UNDERWOOD.—*Interference.*

[*In the matter of the interference between the reissue application of E. P. Lynch and H. R. Raf and the patent of W. A. Dryden and reissued patent of F. J. Underwood, for* CULTIVATOR. *Appeal from the decision of the Examiner of Interferences.—Decided April 22, 1873.*]

The proceedings upon an interference should be suspended whenever it is ascertained that the supposed invention which is in controversy is not patentable.

The Examiner of Interferences is authorized to dissolve an interference when he finds that the invention in controversy is not patentable.

Where there is reason to presume that the question of patentability has not been definitely settled, he may dissolve the interference and remand the case to the Examiner in charge for further consideration.

Rule 59 explained.

To render a combination patentable two things are requisite, a novel assemblage of parts exhibiting invention, and the co-operation of all the parts in producing a useful result.

A split tongue or frame in a walking-cultivator neither modifies the operation of a curved or raised axle therein, nor that of two beams hinged to said axle so as to be moved laterally or vertically independently of each other; neither is its own action modified by them, and there is no legitimate combination between them.

There being no difficulty in the way of substituting a split tongue for a straight one in a walking-cultivator, and no invention required to make it, the substitution was held not patentable.

LEGGETT, *Commissioner:*

This is a motion on the part of Underwood for the dissolution of the interference, based on the ground that so much of the alleged invention of Lynch and Raff as has been placed in interference is not patentable. The subject-matter involved is embodied in the eighth claim of their application, as follows:

"The combination, in a walking-cultivator, of the following instruments, to wit: A split tongue or frame, an arched or raised axle mounted on wheels, and two beams hinged thereto in such a manner as to permit them to be moved vertically and laterally independently of each other, substantially as described."

In behalf of Lynch and Raff a question of jurisdiction is raised. It is contended that there is no authority in the rules for entertaining a motion to dissolve the interference at the present stage of proceedings upon the grounds of this motion, the testimony having been taken and the case having gone to issue upon the merits. In other words, it is maintained that, the case having passed from the jurisdiction of the Primary Examiner, who is assumed to have adjudged the subject-matter patentable, the question of patentability is not one to be opened before any other tribunal, or before him except upon newly-discovered evidence, or such other ground as would be sufficient to warrant a new trial.

Rule 59 provides for the dissolution of an interference whenever it is found that "no interference in fact exists." With respect to what tribunal may find this, it is only provided that "a motion for a dissolution of an interference on the ground that it was improperly declared, if made before the taking of testimony, will be heard by the Primary Examiner who declared the interference." It was assumed that cases in which the proceedings upon the merits would reach the stage of exclusive jurisdiction of the Examiner of Interferences before the question of the patentability of the subject-matter should be raised would be of so infrequent occurrence that no more definite provision than that quoted would be necessary. The rule, however, does not confine the hearing of such a motion exclusively to the Primary Examiner. It only provides that it shall be heard by him if made before the evidence has been taken. In *Lloyd* vs. *Emerson*, Off. Gaz., vol. 2, p. 674, I authorized the Examiner of Interferences to suspend proceedings in any case if it should be manifest from the record, as it was in that case, that the interference had been improperly declared, no patentable subject-matter being involved in interference. This course is

necessary because, whenever it becomes obvious from the record that a patent cannot legally issue upon the subject-matter involved, for want of novelty, it is idle to proceed with a controversy respecting it. It is also analogous in principle to proceedings in courts in some cases, and is sufficiently authorized by implication from the rule above quoted. A motion of this kind, at this stage, is similar, for instance, to a motion to dismiss a suit for want of jurisdiction of the *subject-matter*. It assumes that the subject-matter is not patentable, and therefore that there is no interference over which the Examiner can properly take jurisdiction. A plea to the jurisdiction of the subject-matter may be made at any stage of an action, even on appeal to a superior court, when it goes to the question of the jurisdiction of the court below, and was not entered there. *Gormly* vs. *McIntosh*, 22 Barbour, N. Y., p. 271, and cases therein cited.

The practice of the Office, to be sure, contemplates that the question of the patentability of the subject-matter of an interference shall be decided before an interference is declared. But if it has not been, then it must be before the interference can go on. It is only in cases where the facts of the record are such as might justify a presumption that it had not been, that the Examiner of Interferences has been instructed to dissolve the interference and let the question go back to the Primary Examiner. Such cases will be exceptional. When they do occur, however, it would be mere martinetism to ignore their defects simply because they have happened regularly, in due order and method. I have no question as to the legality and propriety of the practice indicated in such cases.

The issue upon the present motion is whether the references which have been cited by the Examiner do not fully anticipate the claim above quoted. None of the elements of the claim were invented by Lynch and Raff. If, however, they constitute a legal combination, and are not to be found embodied in combination as here shown, then of course the subject-matter of the claim is patentable.

The patent of P. Coonrod, granted December 24, 1867, shows the parts embraced in the claim, except that the tongue he uses is not a split tongue. Split tongues are, however, old. They are used upon straddle-row cultivators to prevent the horses from treading on the corn. This is all the purpose they serve. Coonrod's cultivator, with its ordinary straight tongue, will operate to cultivate corn precisely as applicant's does, because the form, number, and arrangement of the parts are precisely the same, except the *form* of the tongue. That is different; but it is evident that the modification does not produce a new combination, as alleged, because it does not at all affect the operation of the other elements of the claim. The modification of the tongue constitutes an improvement in the tongue itself, because it keeps the horses so far apart as to prevent them from stepping on the growing corn. It operates on the horses, and not in any different manner in conjunction with the wheels and axle and the plows from an ordinary tongue. If the tongue were made in some improved form, elongated, for instance, to prevent the horses from biting off the stalks of corn, as they frequently do when being used in cultivating, that would be a corresponding improvement. Because of such improved form, such a tongue could not properly be claimed in combination with the parts of a cultivator named. Again, suppose an improved whiffletree and neck-yoke and linchpin should be used, which in themselves respectively possess some special advantages. It is obvious that they could not properly be claimed in combination with the wheels, or axle, or plows of a cultivator, if used in their ordinary independent relations to one another; because, however advantageous it might be to apply all three to a cultivator, they do not operate in combination. The advantages resulting from their use are due to each independently of the others. This is just as true of the split tongue here claimed. The alleged combination of parts which constitutes the subject-matter of this interference is, therefore, not a legal one, because it is not new, in view of the patent of Coonrod. The remarks of Commissioner Fisher in *ex parte* John Underwood, C. D. 1870, p. 52, respecting combinations, are applicable to this case; also *ex parte* David Eznor, C. D. 1871, p. 242.

Neither courts nor Commissioners have ever attempted, I believe, to give an authoritative definition of a patentable combination, intended to be of universal application, broad enough to include all that is legitimate and narrow enough to exclude all else. Certainly I shall not attempt to give such a definition. It would seem, however, from the decisions of the courts respecting combinations, cited in the cases above referred to, that two things are always essential: First, a novel assemblage of parts exhibiting invention; second, that the parts shall co-operate in the production of a useful result. By the term co-operate as here used, the courts do not mean merely acting together or simultaneouly, but acting to one common end, to a unitary result. Each and every part must have its sub-function to perform, and each must have a certain relation to and dependence upon every other, and all must act in producing the result. Invention must be exhibited in the sense that some difficulty or obstacle had to be overcome requiring more than ordinary mechanical judgment. In the case under consideration all the elements of the combination claimed are old—all except the split tongue have been used in exactly the same relations before. The split tongue was old—had before been used on cultivators and in numerous other analogous positions. The invention, if any was exercised, consisted in substituting the well-known split tongue for the well-known straight tongue. In making the change there was no obstacle to overcome, no difficulty in the way, and neither ingenuity nor skill required. To call such substitution invention would require a degree of liberality to the applicant that would be oppressive to community, for certainly the farmer should not at this late day be prohibited from using so old and common a thing as a split tongue upon any farming utensil to which his taste or convenience may lead him to attach it.

Again, the combination claimed is faulty from the fact that the parts composing it do not co-operate in the sense required. The relation of the tongue to the other parts is such that they are in no way affected by the circumstance as to whether the tongue is split or not. Their operation is exactly the same, and they produce exactly the same result with a straight tongue as with the split. The axle, wheels, plows, &c., have no influence in securing the benefits arising from the use of the split tongue; neither does the *split* of the tongue have the remotest bearing or influence upon the functions of the other parts; neither do the parts in any proper sense co-operate in producing a unitary result. The split tongue tends to keep the horses from treading upon the corn. This it does without the aid of any of the other parts, and here the peculiar function of the split tongue ends. It would do exactly the same with any other cultivator, whether walking or riding, whether the plows are attached or detached, and whatever might be the shape of the axle.

It is argued that many precedents may be found for such claims in reissues. I have no doubt of that fact. No section of the patent act has been so abused as the one relating to reissues. It is also true that many arrangements of parts having no working relations to each other, and no elements of co-operation, have been patented as combinations, but clearly without authority of law, and improperly; hence they cannot serve as controlling precedents.

The decision of the Examiner of Interferences is reversed, and the interference is for the present suspended, and the application will be returned to the Examiner for further examination upon the matters herein discussed.

S. B. SEXTON.—*Extension.*

[*In the matter of the application of Samuel B. Sexton for extension of Letters Patent for* IMPROVEMENT IN HEATING-STOVES, *granted April 19, 1859, reissued December 3, 1861, and again in two divisions, Nos. 1,621 and 1,622, February 16, 1864, No. 1,621 being again reissued September 27, 1864, and February 12, 1867.—Decided April 18, 1873.*]

A patentee who has licensed others to work his invention is to be charged the same royalty on what the firm to which he belongs has manufactured that his licensees have paid him, and need not account for any further profits.

Where the invention which the patentee is entitled to claim under his patent exceeds in value the amount he has received from it, it will be extended, although all the claims are required to be withdrawn but one, and the limited invention covered by that has been sufficiently remunerated.

When a claim which is allowed to remain on extending a patent defines the invention by reference to another which is required to be disclaimed, the latter will be understood to remain valid so far as it is connected with and embodied in the other.

Every invention which was claimed in an application rejected previous to the act of 1870 must now be considered as abandoned, and if claimed in a patent issued upon an application filed after the one rejected, must be disclaimed before the patent can be extended.

Claims in a reissued patent which embody, though only by way of reference, a feature not shown in the application for the original, must be disclaimed before the patent will be extended.

Claims which are clearly functional, and claims to illegitimate combinations, must be disclaimed, as well as claims to old devices, before a patent will be extended.

A heating-stove containing a suspended magazine and a grate of larger dimensions under it, with a free space above for burning the gases, is patentable, although a furnace of the same structure, employed for heating boilers, and surrounded with water, has been known before.

A claim for "increasing the combustion," "and also insuring a more brilliant illumination," by the manner of constructing a stove as specified, is a functional claim.

A claim for the "adaptation of a fire-place stove" for use with certain other specified elements in it is a functional claim.

There is no legitimate combination between a fire-place stove with diving-flues and a suspended magazine, and a claim for such a combination cannot be sustained.

There is no legitimate combination between a cold-air chamber and a stove having a suspended magazine.

A rejected application is a bar to a new one by the same party for the same invention, unless the second was filed as a renewal or continuance of the first.

The law providing for the division of a patent upon a reissue applies only where there are distinct inventions to be embodied in them, not to the mere application of the same invention to different machines of the same generic class.

Doubted whether a patent should be divided on a reissue so as to embrace in one division the employment of an invention in a fire-place stove, and in the other the use of it in an outstanding stove.

The abuse of the privilege of reissuing patents, by unduly expanding their scope, condemned.

Godfrey vs. *Eames*, 1 Wall., 317, and *ex parte* Shunk, Com. Dec. 1870, p. 10, commented on.

THACHER, *Acting Commissioner:*

The petitioner seeks the extension of reissues No. 1,622 of February 16, 1864, and No. 2,476 of February 12, 1867. The first relates to a fire-place heating-stove, and the second to an outstanding heating-stove, as they are respectively denominated by the trade.

It is set forth in the petitioner's statement with considerable stress that he was the first to combine in a heating-stove the following elements: First, a fuel-magazine suspended above the fire-grate; second, an area of grate-bars and fire-bed of greater diameter than the magazine; and, third, a series of projecting illuminating-windows in such a manner as to radiate heat and light from the combustion taking place between the lower edge of the magazine and the inner sides of the combustion-chamber.

From this combination of elements—which it appears to be true Sexton was the first to produce—a number of substantial advantages result in base-burning stoves. The novelty and utility of *this* invention are fully established upon a careful review of the state of the art prior to the grant of Sexton's original patent, and if his claims were limited to this combination there could be no hesitation in granting him an extension.

The testimony, which it is to observed relates to the invention in general, as embodied in this combination, rather than to the particular combinations embodied in the claims of the two reissued patents under consideration, shows that the patentee's improvements are of great value and importance to the public.

Beyond question their value is much in excess of his remuneration, as shown by his statement of profits, which is in due form and appears to be correct.

Not having made a close monopoly of his invention, he is entitled to manufacturer's profits, and so has charged the patents only with such portion of the profits received from his own manufacturing firm as the usual royalty received from others would amount to. Such a course was approved by the Commissioner in a former case, for the same reason, and is regarded as proper in this. (Lewis Miller, Off. Gaz., vol. 1, p. 431.)

Applicant's diligence in introducing his invention and seeking profit from it has been unexceptionable, and the abstract of title shows he has a sufficient interest in the extended term to warrant the grant of an extension. Upon a careful consideration of the whole case, the only questions arising as to the propriety of granting the extension sought relate to the validity of

the claims of the reissued patents. The keen and vigorous opposition of the remonstrant, as might have been expected, is addressed almost exclusively to this matter, as the most vulnerable point for attack.

Referring to the combination of the elements above mentioned, the petitioner says in his statement: "The principles cited above are embodied in both the patents sought to be extended, and the distinctive feature of difference consists only in the application of said principles to a fire-place stove and an outstanding stove."

It may be questioned whether the application of an invention in one class of heating-stoves, and the application of the same invention, in the same way and with the same method of operation and results, in another class of heating-stoves, furnishes the proper basis for the division of a patent in reissuing.

The first claim of reissue No. 1,622 shows that this point was overlooked when this patent was granted. The law contemplates, not that the same entire invention shall be merely applied to different machines of the same generic class in order to warrant separate patents upon reissue, but that distinct parts of the invention itself—in other words, distinct inventions—shall be embodied in the respective reissued patents. The words of the statute are that the Commissioner may "cause several patents to be issued *for distinct* and *separate parts* of the thing patented." Some of the claims in the patents before me differ only in that the parts recited are in one case embodied in an outstanding stove, and in the other in a fire-place stove. These parts accomplish the same purpose in both stoves, and should not appear as subject-matter exclusively for claims in two patents.

These claims, however, are subject to other grounds of objection upon which they must be disposed of.

The claims of reissue No. 2,476 are as follows:

"1. A stove for warming or heating purposes, constructed with a fuel-magazine supported free from the grate, and a combustion-chamber having a grated fire and air-supplying bed of a greater diameter than the fuel-magazine, so arranged and constructed that the fuel can spread out laterally and form a conical pile, and burn in thin layers out to the wall of the stove, so that the inflamed gases may burn in a free space as they are evolved from the entire outer surface of the incandescent conical pile of coals, and so that air shall be supplied in a direct manner through the grate in said free space, substantially as and for the purposes described.

"2. In combination with the subject-matter of the first claim, constructing the combustion-chamber A with projecting window-frames or door-frames, substantially as and for the purposes described.

"3. A stove for warming or heating purposes embracing the features of construction mentioned in first claim, and the additional feature of the gas or products of combustion, circulating apartment above and around the upper portion of the magazine, substantially as and for the purposes described.

"4. A stove for warming and heating purposes wherein the spreading of the coals in a lateral direction from the lower end of the magazine is wholly unobstructed all around and out to the wall of the stove A, and at the same time the combustion-chamber proper is formed by the outer wall of the stove, and the products of combustion circulate underneath and around the magazine, in combination with illuminating doors or windows in the said outer wall, said windows or doors being located above the grate and above the upper magazine of the lining of the wall, substantially as and for the purposes described.

"5. The combination of the fuel-supply magazine H, which has its lower end free from the grated fire-bed G, and an unobstructed space below it, where the fuel may spread out laterally and burn in a conical pile and in thin layers to the outer wall of the stove, with a stove, A, which has illumination doors or windows in its wall above the lining, all in such manner that the fire can be kindled through the apertures which are covered by the doors or windows, substantially as set forth.

"6. The combination of the unobstructed free space F out to the wall of the stove above the lining, the illumination windows or doors in wall A, and gas-circulating space p around the circumference of the magazine, substantially as described.

"7. In a coal-supply magazine stove, I claim the extended grated surface of the fire-bed outside of reservoir or magazine, in combination with the free space around the magazine of a base-burning stove, substantially as described.

"8. Increasing the combustion and the consequent heating effect of the coal, and also insuring a more brilliant illumination of the wall of the stove, by constructing, arranging, and combining the combustion-chamber proper, the magazine, and the grated fire-bed, all substantially in the manner herein specified."

If the first claim were to be construed broadly it would be regarded as met by the English patent of Grant, No. 13,298, of 1850. The terms of the claim are exactly answered except the word "stove." Grant's device is not a stove. It is a heating-furnace for boilers, and is within and surrounded by the water of the boiler. The parts it exhibits, which are embodied in this claim, would not obviously appear applicable to a heating-stove. Their use as shown in a steam-boiler would scarcely suggest such an application of them. It required some modification and invention to adapt them to a stove. Their adaptation, therefore, constituted an improvement in heating-stoves such as probably warranted a claim for them. But it is not necessary to rest the disposal of this claim upon this possibly doubtful premise. It is met by a more formidable objection. It is completely answered by the rejected application of the inventor filed March 26 and withdrawn April 30, 1856. Upon this point it is proper to observe that it has always been the practice of the Office to reject a subsequent application upon a prior one of the same applicant, showing the same invention, unless the subsequent application has been made as a renewal or continuation of the prior one. I have carefully examined authorities on this point, and conclude that such was not the case in this instance. The application upon which the original patent of 1859 was granted was an independent one, referring to a different stove, claiming an invention not to be found in the prior rejected application, and not filed until nearly three years after the latter was withdrawn. It was therefore in no sense a continuation of the first, or so intended to be.

The case of *Godfrey* vs. *Eames*, 1 Wall., 317, is relied on principally to support a different view. In that case the first application was withdrawn for the express purpose of making a new one, which was filed simultaneously with the withdrawal, and although the model and drawing were changed somewhat, the essential features remained the same, the new claim was in substance like the old, and with equal propriety could have been based upon the old record. The two applications were very properly held to be continuous. But the decision must be construed in connection with the facts in the case, which have been shown to be different in the present instance. The two cases, therefore, are not parallel, and the terms of the decision do not appear to me broad enough to include both. I am aware that a seemingly different conclusion was reached in the extension of *Christian Shunk*, C. D. 1870, 10. It appears, however, from the statement of the case, that the circumstances were the same as in *Godfrey* vs. *Eames*—that is, the withdrawal of the first application and filing of the second were simultaneous. The decision hinges on this fact. But, as already shown, the circumstances in this case were very different; hence the *Shunk* extension furnishes no precedent for such construction of *Godfrey* vs. *Eames* as is now urged in behalf of applicant, and is not in conflict with the opinion expressed above.

The claims embracing elements of the earlier invention I believe to have been erroneously admitted upon reissue, and they must consequently be refused extension. There is an additional reason at this time for their refusal. Congress has expressly recognized the class of old rejected and withdrawn cases in the Office as *pendente lite*, embodying claims not finally adjudicated, and presenting the proper channel for securing rights, not to be held as abandoned except upon proof of the fact. So they were regarded by the Office, for some of them were from time to time revived and allowed to go to patent, and the act of Congress of 1870 confirmed the propriety of such practice. It provided, section 35, that this class of cases must all be renewed within six months from the date of its passage; otherwise they should be regarded as abandoned. Sexton's application of 1856 was never renewed or expressly abandoned. Such claims, therefore, as might have been based upon that application by renewal are now abandoned to the public by express legislation. So far as the present claims are met by that application, therefore, they are the property of the public and cannot be extended. The third and seventh claims, in addition to the first, are thus met, and must be disclaimed.

In the fourth, fifth, and sixth claims an element has been introduced that is not to be found in the original patent. It is new matter, and should not have been admitted even in the specifications, without at least some hint of its existence in the original patent. The rule excluding new matter in reissues should be strictly enforced. Although the evil may not be apparent pending the application, the intent and effect of incorporating new matter in the slightest degree are almost uniformly to unduly expand the scope of patents. Such is the result of the ostensibly casual and unimportant reference to a "lining" in the specifications of these patents. All matter referring to this suppositious "lining" has been unwarrantably interpolated. The violation of the law is glaring when the "lining," though not actually claimed, is embodied in claims as a material element for the determination of the location of parts, and consequently of the nature and scope of the claims.

The eighth claim seeks to cover a result or function. It cannot be construed to signify simply the combination of the elements named in it. Its meaning is doubtful, and it should not have been allowed as it stands. I am unwilling to seem to sanction such practice by permitting it to be extended.

The second claim is the only one in this patent which I find to be valid. If it were the only one capable of being legally based upon the actual invention, there would be a question as to whether the remuneration of the inventor, which has been over $22,000, has not been adequate. But I think the scope of the invention is somewhat broader than this claim indicates, and the patent may be corrected by reissue. It covers the combustion-chamber and projecting windows, "in combination with the subject-matter of the first claim." Each claim should be drawn complete in itself. The first claim here is invalid and must be disclaimed, yet it is a part of the second, which is made up of both and is valid. This involves difficulty, or at least is somewhat awkward. It will of course have to be understood that the first claim of itself, as an independent claim, is stricken from the patent, but as connected with and embodied in the second it remains.

Reissue No. 1,622 presents nine claims as follows:

"1. The adaptation of a fire-place stove which has diving-flues for use with a fuel-magazine which has an unobstructed space between its lower end and the grate, substantially as and for the purpose set forth.

"2. A fire-place stove which has diving-flues constructed with the reduced portion A′, enlarged portion A, reverberating-plate A″, gas-space g, projecting window and door frames ζ, and fuel-supply magazine H, substantially as and for the purpose set forth.

"3. A fire-place stove with diving-flues and kindling-apertures ζ ζ, in combination with a fuel-supply magazine which has a free unobstructed space below and out to the interior surface of the part A, between itself and the grate G, substantially as and for the purpose set forth.

"4. In combination with a fire-place stove which has diving-flues, I claim a fuel-supply magazine which has a free unobstructed burning-space below it and out to the wall of the stove, substantially as described.

"5. The combination of the fuel-supply magazine, which is arranged to have a space between its lower end and the grate G, with a fire-place stove which has a contracted part, A′, in which the gases circulate in contact with and over the cover of the fuel-supply magazine, and from which the gases pass into diving-flues, and thence under or around the ash-pan and up to the draft or exit-flue, substantially as and for the purpose set forth.

"6. The chamber A A′ A″, with door I, in combination with the internally-located fuel-supply magazine H, which is free from the grate and has a removable cover, substantially as and for the purpose set forth.

"7. A fire-place stove which combines in its construction a burning base-surface, G, of larger diameter than the fuel-magazine, a magazine, H, and diving-flues, substantially as and for the purpose set forth.

"8. A cold-air chamber combined, in any manner substantially described, with a stove having a fuel-supply magazine, H, for the purpose set forth.

"9. The combination of the main chamber A, fuel-supply magazine H, flues B E B′, and damper *b*, substantially as and for the purpose set forth."

The first is for "the adaptation of a fire-place stove" for use with one of the elements of the patentee's invention, viz., the fuel-magazine. The magazine is placed in the fire-place stove in the same position, for the same purpose, and accomplishes the same results as in the outstanding stove in Sexton's rejected application of 1856. The subject-matter of the claim is therefore anticipated, so far as it can be said to embody any invention. Besides this it is purely functional, and for that reason never should have been allowed.

The fourth claim covers the alleged combination of the fuel-magazine with a fire-place stove having diving-flues. The flues have no such relation to the magazine as in any legal sense to be regarded as in combination with them. An outstanding stove *having legs* might with just as much propriety be claimed in combination with the magazine. The claim does not cover a valid combination. The magazine is shown in the same relative position in the application of 1856, which is a full answer to this claim.

The eighth claim covers a cold-air chamber combined with a stove having a magazine. Air-chambers have been used since 1850 at least (see patent of Gosnell, April 2, 1850) with stoves not having fuel-magazines. It is impossible for me to perceive what connection there is between the magazine and the air-chamber to render this claim a valid one for the alleged combination. No new result is produced, and, as remarked of the fourth claim, the stove-legs or any other part disconnected and independent in position and operation might as well have been assumed to be in combination with the air-chamber. The claim was improperly granted, because it covers no patentable combination, and is met by the patent cited, showing a stove without a fuel-magazine.

The history of this case exhibits a manifest and, I am glad to say, uncommon perversion of the remedy designed to be provided by law in reissues. The original patent has been boldly expanded from time to time, so as actually to keep pace with the progress of the art as

developed by time and experience, and to preserve apparently a controlling monopoly of a large and popular class of heating-stoves. From a single modest claim covering an actual invention, accompanied with a truthful disclaimer of the invention of "any of the parts of this stove separately considered," have arisen (through the fault of some Examiner, it must be acknowledged) seventeen claims, most of which are broader than the invention, and scarcely one of which was not manifesty dictated in some measure by the progress of the art as developed by other inventors.

Such practice cannot be too strongly condemned. While a generous liberality should be shown to inventors, so as to afford ample protection for everything rightfully their own, an unwarrantable expansion of patents is a gross violation of lawful privilege, and the infliction of a great wrong upon other inventors and the public generally. As it is made the duty of the Commissioner in extensions to examine the whole case *de novo*, I am necessarily compelled to restrict these patents to what lawfully may be secured under them before granting the extension sought.

The patents will be extended—provided the fees are duly paid—upon the disclaimer of the first, fourth, and eighth claims of reissue No. 1,622, and all except the second claim of reissue No. 2,476.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

T. J. W. ROBERTSON *vs.* SECOMBE MANUFACTURING COMPANY.

[*In Equity.—Before Blatchford, J.—Decision rendered February* 27, 1873.]

ROBERTSON'S PATENT FOR HAND-STAMP—FUNCTION OF REISSUES—INVENTION AS RELATED TO THE STATE OF THE ART.

The claims of the patent for an improvement in hand-stamps, granted to T. J. W. Robertson, September 22, 1857, and reissued December 12, 1871, which are in these words, viz: "1. In combination with a handle and a series of printing-wheels, or their equivalents, for printing dates, a fixed type-form or printing-die, for dating purposes, substantially as described; 2. A hand-stamp having a permanent inscription form or die, provided with an aperture through which the type-wheels work, when so arranged that the said type-wheels may be turned, for changing the dates, without shifting the fixed form or die, substantially as specified; 3. A hand-stamp having a series of type-wheels provided with holes to receive a locking-pin, E, substantially as specified," held to be valid.

Robertson's invention, by which a permanent type-form is combined with a handle, and with type-wheels so arranged as to be capable of making as many impressions as may be desired, is not anticipated by a combination of type-wheels for numbering with a fixed type-form for dating and printing, but which, having no handle, is incapable of use as a hand-stamp, and which requires the material to be pressed down upon it from above.

Nor by a combination of type-wheels for numbering, (requiring the change of one or more type-wheels at every stroke,) combined with type-forms for dating and printing.

It is entirely within the purpose and scope of a reissue to put in the specification a fuller statement than may have been found in the specification of the original patent, of the state of the art, of the nature of the improvements developed by the patentee's arrangement, and of the advantages secured by the use of such improvements.

The presence of a comma in a reissue disregarded, when shown by the context to be a clerical error.

Three type-wheels having been used in a hand-stamp to print the month and the day of the month, it would be obvious, if desired, and would be no invention, to add a fourth wheel to print the year, or to use the third wheel for this, putting all the days of the month on one wheel.

A paper discredited as a part of a caveat, when the same had been indorsed by the Commissioner of Patents, after full investigation, as forming no valid part of such caveat.

[*F. H. Betts*, for complainant.

Nelson Orose, for defendant.]

BLATCHFORD, *J.*:

This suit is brought on reissued letters patent granted to the plaintiff December 12, 1871, for an "improvement in hand-stamps," the original letters patent having been granted to the plaintiff September 22, 1857, and extended for seven years from September 22, 1871. The reissued letters patent are granted for twenty-one years from the 22d of September, 1857. The specification says:

"My invention relates to the construction of stamps for producing an impression, such as a postmark or other analogous device, a part of which requires to be frequently changed, such as the date, and part requires to remain the same, as the name of the post-office. In order to give such stamps any considerable utility, the impression must be readily made, and that part of the type which requires frequent change must be always on hand. This result I secure by combining in a hand-stamp fixed type for producing that part of the inscription designed to be always the same, and a series of combined changeable types bearing the necessary characters to allow of any desired change, which shall be connected with and form part of the stamp. These types are connected and arranged to revolve in substantially the same manner as the combined types used in book-paging machines, but differing therefrom in having an arrangement by which the desired inscription may be printed repeatedly, without changing at each impression.

"Prior to my invention dating-stamps were made with loose types; book-paging machines were used with combined types in the form of wheels and chains; and machines for printing tickets, &c., had type-wheels combined with permanent inscription-forms. But these last machines were so made as to produce the impression only on the under surface of the materials, and to change the type-wheels at every stroke. So far as I am aware, no dating-stamp was ever made, previous to mine, with wheel-type or its equivalent, nor a fixed inscription plate or form combined with such type in such a manner that the latter could be readily turned without changing the relative positions of the said wheels and permanent inscription, and yet be capable of printing simultaneously the combined inscriptions in a small space, as is necessary in canceling revenue-stamps; nor could an impression be readily made by such machines on the upper surface of the paper.

"My invention, therefore, consists, mainly, in the construction of a stamp in which combined changeable dating-type are used, in combination with a fixed inscription-form or printing-die, and in so arranging these parts in connection with a stem or handle that the dating-types may be easily changed and thoroughly secured, and that the impression may be readily made in a small compass on the upper surface of the material."

The specification then describes the construction and arrangement of the parts of the stamp, with references to three figures of drawings annexed. There is a handle, to the bottom of which is attached a metallic forked shank. To the bottom of this shank is attached a metallic ring, said ring being secured to the shank by means of screw-bolts. The lower part of the shank is also notched, in order to receive the ring and form a front bearing for it; but it is stated that various other methods may be adopted, at the pleasure of the maker, for attaching the ring to the shank, and that, when the stamp is intended for a letter-stamp, the name of the post-office may be engraved on the face of the ring. A shaft passes horizontally through the shank. On this shaft are placed three type-wheels, which revolve independently of each other on the shaft. It is stated that the faces of these type-wheels may be provided, respectively, with "the names of the months, of the year, and also ten numerals." The shaft is arranged at such a distance from the face of the ring that the three type-wheels may be turned so that the types upon said

wheels will come in line or form a horizontal plane with the types on the ring, and thus when the face of the stamp is inked over by any suitable inking device, and the stamp duly pressed upon a letter or other suitable substance, an impression will be left thereupon of the types contained on the ring, and also of those types of the three type-wheels that are in line with the types on the ring. Only one line of types upon the type-wheels can simultaneously come into a horizontal plane with the types on the ring, the remaining types being distributed around the peripheries of the type-wheels so that they cannot touch the paper on which the impression is to be made. A lock-pin passes horizontally through the shank, and also through the three type-wheels. The object of this pin is to lock the type-wheels, so that when any one line of types has been turned and brought into a horizontal plane with the types upon the ring, such line of types will be held fast and prevented from getting out of place. By removing the pin the combination of letters on the type-wheels may be changed at pleasure. The stamp shown in the drawings has the face of its ring made in circular form; but it is stated to be obvious that the shape of the ring may be changed to suit the pleasure of the purchaser, without changing the general construction of the stamp. It is also stated that the type-wheels and ring may be engraved with any suitable letters or figures, and that the device is particularly useful for stamping letters, tickets, &c., where the words or numbers have to be frequently changed. It is also stated that, instead of the pin for locking the type-wheels, small springs may be used, one end of each being attached to the shank, and the other end pressing into the interstices between the lines of types upon the type-wheels, and so made as to prevent accidental movement of the wheels in either direction; and that, although either the pin or springs may be used separately for locking the type-wheels, the patentee would prefer to use them in combination, as the springs may hold the day-wheel in position when the month-wheel is being turned, which the pin will not do, and when the wheels are properly arranged the pin may be screwed fast, and the wheels much more securely locked than by the use of springs alone.

The claims are as follows:

1. In combination with a handle and a series of printing-wheels, or their equivalents, for printing dates, a fixed type-form or printing-die, for dating purposes, substantially as described.
2. A hand-stamp having a permanent inscription form or die, provided with an aperture through which the type-wheels work, when so arranged that the said type-wheels may be turned, for changing the dates, without shifting the fixed form or die, substantially as specified.
3. A hand-stamp having a series of type-wheels provided with holes to receive a locking-pin, E, substantially as specified.

The Patent Office, in examining the question of the novelty of the invention, on the application for the extension of the patent, which was opposed, referred to the English and American patents on the subject. There is an English patent of C. M. Hannington, in 1831, which has a series of type-wheels pivoted on a shaft, and entering an opening in a plate, which plate has engraved or formed upon it, on one side of the opening, the date, and on the other side, in a semicircular form, "two pence." The type on the type-wheels are figures or numbers. The article to be stamped is pressed down on the type by screw-pressure. The object of the device is described as being for producing government, commercial, or law stamps, numbering documents, and stamping fabrics with numbers and date to prevent fraud. It was a combination of type-wheels for numbering, with a fixed type-form for dating and printing, but it had no handle, and was not a hand-stamp, and the impression was made on the under surface of the material. On an examination of all the prior patents, the Patent Office arrived at the conclusion that type-wheels for numbering and lettering were old; that type-forms for stamping or printing the name of a post-office or other matter were old; that type-forms combined with ordinary type for dating were old; and that type-wheels for numbering, (requiring the change of one or more type-wheels at every stroke,) combined with type-forms for dating and printing, were old. The conclusion of the Patent Office was that there was novelty in using the type-wheels for dating purposes, in combination with a fixed type-form for impressing the name of a post-office or other matter, and a handle, and that this was a substantive improvement, in view of the numerous applications made and patents granted subsequently to the date of the Robertson patent, embracing such combination. The use of a handle for holding the entire apparatus enables the impression to be made by pressing the handle downward perpendicularly, carrying with it the apparatus, and enables this to be done by the hand with great facility and rapidity, resulting in having the impressions made on the upper side of the material, thus dispensing with the use of mechanical pressure to press the material down upon the type; and combined with this is the facility of changing the date, when required, by turning the type-wheels without moving or shifting the fixed plate, while as many impressions of the same date as are desired can be had, and an impression from fixed type in connection can be had at the same time. No apparatus presenting these combined features is shown to have existed before the invention of Robertson. The utility, and hence the patentability, of this new combination is shown by the extensive demand for and use of stamps containing these combined features.

There is no foundation for the claim that the plaintiff abandoned his patent after it was issued to him. It is shown that he used every effort within his power to introduce the invention into use, and it is not shown that he ever acquiesced in the infringement of his patent.

It is urged that the reissued patent is not for the same invention as the original patent, and that there are material variations between the specifications of the two patents. The drawings of the original patent and of the reissue are identical. The description of the construction and arrangement of the apparatus, with the references to the drawings, is the same in the two specifications. The specification of the reissue contains a more full statement than the specification of the original patent did of the state of the art, of the nature of the improvements developed in the patentee's arrangement, and of the advantages secured by the use of such improvements. This is entirely within the purpose and scope of a reissue.

It is contended that the specification of the reissue describes a year-dating wheel not found in the specification or drawings of the original patent, and which is found in the defendant's stamp. The drawings in both

patents show three type-wheels, one of which appears to have on it the names of the months in succession; another the three figures 1, 2, 3 in succession; and the third one the nine figures 1, 2, 3, 4, 5, 6, 7, 8, and 9, and the cipher 0, in succession. By the use of the three type-wheels any day of any month can thus be stamped. The specification of the original patent says: "The faces of these type-wheels may be provided, respectively, with the names of the months, of the year, and also the ten numerals." It also says: "The type-wheels and ring may also be engraved with any suitable letters or figures."

"The faces of these type-wheels may be provided, respectively, with the names of the months, of the year, and also ten numerals." The document which reads thus is a printed paper annexed to the reissue patent, under the seal of the Patent Office. It also says: "The type-wheels and ring may also be engraved with any suitable letters or figures." In the course of the testimony of one of the witnesses for the defendants, it is stated that a printed copy of the reissued patent is put in evidence. Such printed copy is then copied in writing, and in such written copy the following language is found: "The faces of these type-wheels may be provided, respectively, with the names of the months, of the year, and also the ten numerals." It is contended that the patentee intended, by inserting a comma after the word "months," to introduce into his reissued specification the suggestion that a type-wheel with a succession of figures upon it for the years could be used; that the specification of the original patent has no such comma, and no such suggestion; and that therein there is a fraudulent interpolation. This view is not sustainable. There is nothing to show that the interposition of the comma was not an accidental or an arbitrary punctuation, and everything in the context and language shows that it was. Three type-wheels, and only three, are shown or described. One has the months on it; and if another has on it the years, and the third has only the ten numerals, only nine days in any month could ever be represented. There is no suggestion in this connection of four wheels, or that the third wheel shall have on it all the days of the month. The expression "the names of the months of the year" is a sensible expression. The expression "the names of the year" is a meaningless expression. The fact that in all respects the descriptive part of the specification of the reissue seems to follow the language of the descriptive part of the specification of the original patent; and the further fact that in the specification annexed to the original patent the words "the ten numerals" are found, while in the printed specification annexed to the reissued patent, under seal, the words are "ten numerals," and not "the ten numerals," would indicate that the use of the comma after the word "months" is a clerical error, and purposeless and improper. There was no need of making any suggestion of the use of a wheel for the years. The use of such a wheel in the patentee's combination was obvious, if desired, and was no invention; whether added as a fourth wheel or made one of three wheels by putting all the days of the month on one wheel. The suggestion in both specifications that the type-wheels could be engraved with any suitable letters or figures covered the use of one of them for the years. It is well known that at the date of Robertson's patent, in 1857, it was not common in the United States to put on a post-office stamp, for which, from his specification and drawings, his stamp would seem to have been especially designed, the figures of the year, or anything but the name of the month and the figure or figures of the day of the month, and the name of the post-office, as shown in the specification and drawings of the patent. Everything tends to show that the use of the comma after the word "months" is not one to which any meaning or effect can be attached.

The claims of the reissue are fully warranted by what appears in the text and drawings of the specification of the original patent. It is urged that the original specification says nothing as to printing "dates" or as to "dating" purposes, and that that is made a prominent feature in the specification and claims of the reissue. But the original specification states that when the stamp is intended for a post-office or letter stamp—that is, a stamp to stamp on a letter in a post-office the name of the post-office and the month and day of the month—the name of the post-office is to be on the fixed ring, and the type-wheels are to have the names of the months and the numerals which are to make the days of the month; and that the usefulness of the device consists particularly in the facility of changing the impression to be made by the type-wheels—that is, the month and day—which is the date. The drawings show all this. A month and a day of such month make a date, although no year is added. The addition of the year makes a more full date, and so does the addition of the hour and minute of the day. But month and day are in common parlance a date.

The principal defense set up in this case is that the improvements claimed by the plaintiff in his reissued patent were previously invented by one Marcus P. Norton, of Troy, New York. So far as regards the contents of a caveat filed in the Patent Office by said Norton on the 21st of June, 1855, it is sufficient to say that the improvements claimed by the plaintiff are not found on that caveat. So far as regards the contents of the paper called "an additional caveat," and purporting to be dated August 21, 1855, and set up in the answer as having been filed in the Patent Office on the 25th of August, 1855, in, and with, and as a part of the said caveat filed June 21, 1855, it is sufficient to say that, after due notice to said Norton, and a trial had before a commission appointed by the Commissioner of Patents, the said paper was, in September, 1871, adjudged by the said commission to be fraudulent, and to have been surreptitiously introduced into the caveat file of said Norton filed June 21, 1855, and that thereupon the Commissioner of Patents indorsed on said paper a memorandum, signed by him, that said paper does not form a valid portion of said caveat.

There remains the evidence as to prior existence in fact, as completed inventions made by Norton, of the plaintiff's improvements. As to this the burden of proof is on the defendants, and they do not establish the fact satisfactorily. Norton's own evidence is, manifestly, not to be relied upon. The circumstances attending the taking of his deposition in this suit, the contradictions in sworn statements he has made at different times regarding the alleged caveat, and the manner in which, as shown by the record, he caused witnesses to testify in *ex parte* depositions to matters of which they had no recollection, make it impossible to rely on his testimony.

But the evidence of Norton and that of the other witnesses for the defendants shows nothing done by Norton prior to the plaintiff's invention which amounted to more than an unsuccessful experiment. The plaintiff made the first successful practical working machine.

The infringement of the patent is admitted. There must be a decree for the plaintiff for a perpetual injunction, and an account of profits and an ascertainment of damages and costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

23,996.—*Surgical Splints.*—Granted to DAVID AHL, May 17, 1859. Hearing April 30, 1873.

24,009.—*Machines for Upsetting Tires.*—Granted to CHAUNCEY L. CROWELL and ROBERT SMITH, May 17, 1859. Hearing April 30, 1873.

24,022.—*Sewing-Machines.*—Granted to JOSHUA GRAY, May 17, 1859. Hearing April 30, 1873.

24,034.—*Railroad Frogs.*—Granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864. Hearing April 30, 1873.

24,046.—*Machines for Rolling Fabrics.*—Granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872. Hearing April 30, 1873.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.*—Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Heddles to Tin Pulls.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABRATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHENELY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. MARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Slats.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, uly 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODSS and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,650.—*Improvement in Steam-Boiler Furnaces*, granted to JONATHAN AMORY, April 19, 1859; reissued August 29, 1865, numbered 2,057.

Claim.—The method of increasing the combustion and protecting the combustion-curves, substantially as described.

23,665.—*Improvement in Cooking-Range*, granted to BENJAMIN WELLS DUNKLEE, April 19, 1859.

Claim.—The arrangement of the two induction-flues A B, the gage-throats, their plates or bars, and the flues around and between the two ovens, a single damper and its opening being placed over the middle flue, and with respect to the two flues, as specified.

23,703.—*Improved Machine for Making Drain-Pipes*, granted to BRADFORD S. PIERCE and MASON K. PIERCE, April 19, 1859; reissued February 28, 1865, numbered 1,897; reissued January 14, 1868, numbered 2,841; reissued April 27, 1869, numbered 3,413.

Claim.—1. The case, in combination with the core, and with the core-socket, when the latter is constructed and operates in the manner herein described.

2. In a mold for molding drain-pipe, a core-socket and a case constructed, arranged, and combined in the manner described, so that the core-socket shall constitute a working portion of the mold during the whole of the molding process, substantially as and for the purposes set forth.

3. The combination, with the core and core-socket, of suitable mechanism for removing the core through the core-socket, from the finished pipe, without injury to the latter, substantially in the manner and for the purposes described.

4. The arrangement of the mold-case and core upon a suitable platform or base, in the manner described, so that the pipe can be molded and the core discharged therefrom without changing the position of the pipe and mold-case, substantially as set forth.

5. The arrangement of the mixing apparatus and of the core-relieving devices above the platform which conveys the molds, in the manner and for the purpose substantially as specified.

6. The combination of the case, core, and core-socket with the perforated revolving disk, substantially as and for the purposes described.

23,707.—*Improvement in Harvesters*, granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, numbered 2,230; reissued March 26, 1872, numbered 4,824. Division A.

Claim.—1. The combination of the finger-beam in a harvesting-machine with the outer end of the bar by which it is supported and drawn by means of two hinge-joints, one having a vertical and the other a horizontal axis arranged at or near the shoe, which supports the heel or inner end of the finger-beam, whereby the finger-beam and cutting apparatus can not only be conveniently folded vertically to the side of the machine, but also horizontally to a position or line at a right angle, or nearly so, to the working position of said beam or cutting apparatus, substantially as and for the purposes stated.

2. The combination, with the finger-beam and bar F, of the hinged forked plate G, substantially as and for the purposes set forth.

3. The combination, with bar F and hinged plate G, of the holding-pin, substantially as and for the purposes set forth.

4. The combination, with the hinged plate G and bar F, of the bearing-ring H and supporting-hook *b*, substantially as and for the purposes set forth.

5. The combination, with the horizontally-folding finger-beam, of the jointed connecting or pitman rod J, as shown and described.

23,707.—*Improvement in Harvesters*, granted to SAMUEL RAY and MOSES R. SHALTERS, April 19, 1859; reissued April 17, 1866, numbered 2,230; reissued March 26, 1872, numbered 4,226. Division C.

Claim.—1. The combination of the forked connecting-arm, the shoe having its forward hinge-ear in front of the line of cut, and a stiffening-lug on the shoe and near to the hinge-ear, whereby the finger-bar is stiffened, and at the same time a free and unobstructed space is left between the finger-bar and connecting-arm, substantially as and for the purposes described.

2. The combination, with the driver's seat in a harvesting-machine, of a spiral-spring support and a tubular spring-guide stand, whereby the seat is prevented from turning and the elasticity of the seat preserved, for the purposes stated.

3. A slotted tubular-spring support, in combination with the driver's seat and the frame which supports it in a harvesting-machine.

23,716.—*Improvement in Stoves*, granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, numbered 1,242; and again reissued February 16, 1864, numbered 1,632.

Claim.—1. The adaptation of a fire-place stove which has diving-flues for use with a fuel-supply magazine which has an unobstructed space between its lower end and the grate, substantially as and for the purpose set forth.

2. A fire-place stove which has diving-flues, constructed with the reduced portion A^1, enlarged portion A, reverberating-plate A^2, gas-space *g*, projecting window or door frames *i*, and fuel-supply magazine H, substantially as and for the purpose set forth

3. A fire-place stove with diving-flues and kindling-apertures *i i*, in combination with a fuel-supply magazine which has a free unobstructed space below and out to the interior surface of the part A, between itself and the grate G, substantially as and for the purpose set forth.

4. In combination with a fire-place stove which has diving-flues, a fuel-supply magazine which has a free unobstructed burning-space below it and out to the wall of the stove, substantially as described.

5. The combination of the fuel-supply magazine, which is arranged to have a space between the lower end and the grate G, with a fire-place stove which has a contracted part, A^1, in which the gases circulate in contact with and over the cover of the fuel-supply magazine, and from which the gases pass into diving-flues, and thence under or around the ash-pan and up to the draft or exit flue, substantially as and for the purpose set forth.

6. The chamber A A^1 A^2 with door I, in combination with the internally-located fuel-supply magazine H, which is free from the grate and has a removable cover, substantially as and for the purpose set forth.

7. A fire-place stove which combines in its construction a burning-base surface, G, of larger diameter than the fuel-magazine, a magazine, H, and diving-flues, substantially as and for the purpose set forth.

8. A cold-air chamber combined in any manner, substantially as described, with a stove having the fuel-supply magazine H, for the purpose set forth.

9. The combination of the main chamber A, fuel-supply magazine H, flues B E E^1, and damper *b*, substantially as and for the purpose set forth.

Disclaimer filed April 18, 1873.

Disclaims first, fourth, and eighth clauses of claim, as above set forth.

23,716.—*Heating-Stove*, granted to SAMUEL B. SEXTON, April 19, 1859; reissued December 3, 1861, numbered 1,242; reissued February 6, 1864, numbered 1,632; reissued September 27, 1864, numbered 1,774; reissued February 12, 1867, numbered 2,476.

Claim.—1. A stove for warming or heating purposes constructed with a fuel-magazine supported free from the grate and a combustion-chamber having a grated fire and air-supplying bed of a greater diameter than the fuel-magazine, so arranged and constructed that the fuel can spread out laterally, and form a conical pile, and burn in thin layers out to the wall of the stove, so that the inflamed gases may burn in a free space as they are evolved from the entire outer surface of the incandescent conical pile of coals, and so that air shall be supplied in a direct manner through the grate into said free space, substantially as and for the purposes described.

2. In combination with the subject-matter of the first claim, constructing the combustion-chamber A with projecting window-frames or door-frames, substantially as and for the purposes described.

3. A stove for warming or heating purposes embracing the features of construction mentioned in my first claim, and the additional feature of the gas or products of combustion, circulating-apartment above and around the upper portion of the magazine, substantially as and for the purposes described.

4. A stove for warming and heating purposes wherein the spreading of the coals in a lateral direction from the lower end of the magazine is wholly unobstructed all around and out to the wall of the stove A, and at the same time the combustion-chamber proper is formed by the outer wall of the stove, and the products of combustion circulate underneath and around the magazine, in combination with illumination doors or windows in the said outer wall, said windows or doors being located above the grate and above the upper margin of the lining of the wall, substantially as and for the purposes described.

5. The combination of a fuel-supply magazine, H, which has its lower end free from the grated fire-bed G, and an unobstructed space below it, where the fuel may spread out laterally and burn in a conical pile, and in thin layers, to the outer wall of the stove, with a stove, A, which has illumination doors or windows in its wall above the lining, all in such manner that the fire can be kindled through the apertures, which are covered by the doors or windows, substantially as set forth.

6. The combination of the unobstructed free space F out to the wall of the stove above the lining, the illumination windows or doors in wall A, and gas-circulating space *p* around the circumference of the magazine, substantially as described.

7. In a coal-supply magazine-stove, I claim the extended grated surface of the fire-bed outside of reservoir or magazine, in combination with the free space around the magazine of a base-burning stove, substantially as described.

8. Increasing the combustion and the consequent heating effect of the coal, and also insuring a more brilliant illumination of the wall of the stove, by constructing, arranging, and combining the combustion-chamber proper, the magazine, and the grated fire-bed, all substantially in the manner herein specified.

Disclaimer filed April 18, 1873.

Disclaims all of the above claim except the second clause thereof.

23,735.—*Improved Double-Seaming Machines*, granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859.

Claim.—The combination of the disks E and D and the burring-pulley H, the planing-down pulleys I, the double burring-pulleys K, and the finishing-pulley L, in the manner and for the purpose substantially as above described.

23,736.—*Improved Machine for Corrugating Sheet Metal*, granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., April 19, 1859.

Claim.—The arrangement of the upper and lower heads, the forming-rollers H H, together with the rollers which support the cylinder to be corrugated, at the requisite angle, substantially as above described.

DISCLAIMERS FILED.

23,716.—SAMUEL B. SEXTON, Baltimore, Md.—*Improvement in Stoves*, granted April 19, 1859; reissued December 3, 1861, No. 1,242; again reissued February 16, 1864, No. 1,632. Disclaimer filed April 18, 1873. Disclaims:

"Everything claimed in the first, fourth, and eighth clauses of the said claim."

23,716.—SAMUEL B. SEXTON, Baltimore, Md.—*Improvement in Stoves*, granted April 19, 1859; reissued December 3, 1861, No. 1,242; again reissued February 16, 1864, No. 1,632; again reissued September 27, 1864, No. 1,774. Disclaimer filed April 18, 1873. Disclaims:

"Everything included in my said claim, except the parts and combinations specified in the second clause thereof."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date April 15, 1873.]

6,586.—*Parlor-Stove.*—WILLIAM DOYLE, Albany, N. Y. Application filed March 12, 1873.

6,587.—*Glass Dishes and Nappies.*—JAMES HORNE, Bellaire, Ohio. Application filed April 3, 1873.

6,588.—*Carpet.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CREASE & SLOAN, same place. Application filed April 8, 1873.

6,589.—*Badge.*—HERMANN A. OESTERLE, Philadelphia, Pa. Application filed March 21, 1873.

6,590.—*Carpet.*—JOHN POWELL, Kidderminster, England, assignor to HENRY JECKS DIXON & SONS, same place. Application filed March 19, 1873.

6,591.—*Carpet.*—JOHN POWELL, Kidderminster, England, assignor to HENRY JECKS DIXON & SONS, same place. Application filed March 19, 1873.

6,592.—*Coffin-Handle Socket.*—JAMES S. RAY, East Haddam, Conn. Application filed March 24, 1873.

6,593.—*Back Cross-Strap Mountings for Carriages.*—ANSON SEARLS, Newark, N. J. Application filed January 6, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date April 15, 1873.]

1,211.—*Frillings, Gimps, Ribbons, &c.*—FREDERICK BROWETT & CO., Coventry, England. Application filed October 26, 1872.

1,212.—*Lubricating Compound.*—GERDOM, COOK & CO., New York, N. Y. Application filed September 26, 1872.

1,213.—*Kiln-Dried Corn-Meal.*—KIPE & TOWNSEND, Chadd's Ford, Pa. Application filed April 2, 1873.

1,214.—*Liniment.*—MERCHANT'S GARGLING OIL COMPANY, Lockport, N. Y. Application filed December 23, 1872.

1,215.—*Liniment.*—MERCHANT'S GARGLING OIL COMPANY, Lockport, N. Y. Application filed December 23, 1872.

1,216.—*Pile Remedy.*—JOHN P. MILLER, Baltimore, Md. Application filed March 25, 1873.

1,217.—*Prints.*—JAMES R. OSGOOD & CO., Boston, Mass. Application filed March 27, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date April 15, 1873.]

ORIGINAL PATENTS.

137,752.—*Butter-Package.*—JOHN ANDREWS, Cleveland, Ohio. Application filed March 24, 1873.

The package is constructed of two pieces of thin material, one forming the sides and another the top and bottom, and the two attached by a pin in the back fold of it, to secure the parts and form a door or cover.

Claim.—The herein-described butter-package, consisting of the strip, Fig. 4, of which the top and bottom A B of said package are made, and a corresponding strip constituting the sides E, F, G, and H of said package, arranged and combined in the manner as and for the purpose set forth.

137,753.—*Sash-Weight.*—PETER ASHEN, Philadelphia, Pa. Application filed March 3, 1873.

Two holes, both beveled from the same side, are cast in the upper end of the weight, and the upper one is prolonged into a recess which extends to the top of the weight. The rope is knotted and passed through one hole, with the knot resting in the countersunk hole, and then returned through the other hole. When the weight is suspended the cord falls into the vertical groove. This arrangement of the holes allows the cord to be in line with the longitudinal center of the weight, which must then hang perpendicularly. Neither the knot nor the cord can touch the sides of the weight-box and become worn.

Claim.—The combination of the holes B and A, beveled from the same side, and the vertical recess above the latter, all arranged as described, and for the purpose herein set forth.

137,754.—*Water-Elevator.*—JARED A. AYERS, Mystic River, Conn. Application filed September 7, 1872.
